NOTES.

The British Association.—The first party of the members who recently toured South Africa, including Sir William Preece, arrived at Southampton last Saturday and entrained for London. Their impressions regarding the tour are stated to vary somewhat, but in general it appears to be voted an excellent success.

London's Electricity Supply.—With the new session just opened the committees of the London County Council are stated to be again considering the question of a municipal central electricity supply for the Metropolis. We have previously expressed our views on this subject, but await with interest the new measure projected by the Council.

Institution of Mechanical Engineers. — The ensuing session of this institution will be inaugurated on Friday, Oct. 20, at 8 p.m., when a paper by Colonel L. Cubillo on "The Manufacture of Cartridge Cases for Quick-Firing Guns" will be presented. Subsequent general meetings will be held on Nov. 17, Dec. 15, Jan. 19, Feb. 16 (annual general meeting), March 16, and April 27.

Electro-Harmonic Society.—The nineteenth season of this society will be inaugurated on Friday evening, Oct. 20, at 8 p.m., under the chairmanship of Mr. W. Worby Beaumont, in the King's Hall, Holborn Restaurant. Vocal music will be rendered by Messrs. F. Norcup and H. Dearth, while the instrumentalists will be Messrs. T. E. Gatehouse and A. E. Izard. Some capital variety items will be contributed by Messrs. Chas. Capper, W. Edwards, N. H. Owen, and Harrison Hill, and the hon. secretary, Mr. W. E. Lane, hopes to see a good assembly of members.

Machine Coal-Cutting in India.—The report of the Chief Inspector of Mines of India for 1904 states that at present coal-cutting machines are used at only two collieries in India. Nearly all the coal is won by the "bord-and-pillar" system—*i.e.*, cutting the seams into pillars by driving galleries. The pillars are seldom extracted. The cheapness of Indian labour, compared with European and American, has probably prevented enterprise in the use of machines being shown in India. There should, however, be a good opening for machinery, as the native miners do not exhibit any great aptitude, though they have shown themselves capable of managing the machines. If any doubt remains as to a reduction in the cost of machine-cut coal, there can be no question in regard to the great economy in time. With those now in use, a gallery could be driven at least twice as far in a given time as by hand.

Glasgow Technical College Scientific Society.—The opening meeting of the fourteenth session will be held on Saturday evening, Oct. 21, when Mr. Henry Dyer will deliver a lecture upon "The Training and Work of Engineers in some of their wider aspects." The complete syllabus for the session is as follows: Nov. 4—"Electric Power Plant Design," by Mr. Philip D. Ionides; Nov. 18—"The Commercial Efficiency of Prime Movers," by Mr. A. Marshall Downie; Dec. 2—"Metallography," by Mr. James Muir; Dec. 9—fourteenth anniversary dinner; Dec. 16—"The Economy of Power Production—Relative Merits of Gas and Steam Engines for Various Purposes," by Mr. William D. Hamilton; Jan. 20, 1906—"Deep Mine Pumping," by Mr. John Hogg; Jan. 27—"Cylinder Ratios," by Mr. James Andrews; Feb. 3—"Notes on Tool-Room Organisation and Practice," by Mr. George Blair; Feb. 17—"The Inglis Patent Boiler," by Mr. Gardiner Inglis; March 3—"Portable Electric Tools and their Application to Industrial Purposes," by Mr. Andrew Stewart; March 17—"Metals Used for Bearings of Shafting and Lubrication of Same," by Mr. James Murdoch; March 31—annual general meeting.

South Africa.—Since the immediate effects of the war were overcome electricity has made great strides in South Africa both for lighting and traction, and its general adoption for mining purposes is coming in for greater attention. Our contemporary the *British South African Export Gazette* estimates the value of the electrical plant now being installed in that part of the world at over half a million per annum, apart from such materials as boilers and engines. Of this amount about two-thirds is in respect of electrical machinery, another £100,000 goes in telegraph and telephone material, the remainder being spent on fittings and miscellaneous apparatus. Now that the country is settling down there is a good prospect of steady development. Already electricity has been adopted even by the minor towns for lighting, and practically all the large towns have their electric tramway system. It is gratifying to see that, though the United States is asserting itself in South Africa in the matter of electrical machinery, English makers hold the field with regard to fittings and accessories. In this branch the United Kingdom supplied over 70 per cent. of the total last year, Germany and the United States, who were second and third respectively, showing quite modest results. We trust that British manufacturers will see to it that they maintain this field in our South African Colonies, and not only so, but make a strong bid for a larger share of the orders for electrical machinery.

London County Council Tenders.—In general it has been the policy of the London County Council to purchase in the cheapest market, with the result that, whether it be the home manufacturers' fault or not, contracts have gone abroad. Where a number of firms tender to the same specification it is rather difficult to induce a committee to exercise discrimination upon other considerations than that of price; hence such matters as quality of work are apt to be overlooked. The Highways Committee of the London County Council, however, have lately shown a considerable degree of broad-mindedness in this respect. Two or three months ago it was decided to purchase an additional 150 cars, and of the tenders received for the car bodies that of the Hungarian Railway Carriage and Machine Works, Limited—viz., £388 per car—was the lowest. This company, however, were not prepared to accept the Council's conditions of labour, so it was decided to accept Messrs. Hurst, Nelson, and Co.'s offer of £423. 10s. per car—this being the lowest home tender. In regard to the trucks the committee carefully examined the designs submitted by the different firms, as, in view of the increased weight due to top covers, this is a matter of great importance. As the result of their investigations the committee decided to accept the tender of Messrs. Mountain and Gibson, Limited, which stood at £120 per car, against the £92 of the Hungarian Company and the £96 of the lowest home tender. Taken altogether, our Æediles are to be complimented upon such exercise of discrimination.

The American Institute. — The volume dated September of the *Proceedings* of the American Institute contains the discussions on "High Power Surges in Electric Distribution Systems of Great Magnitude"; "An Experimental Study of the Rise of Potential on Commercial Transmission Lines due to Static Disturbances, such as Switching, Grounding, etc."; "The Constant-Current Mercury-Arc Rectifier"; "Data Relating to Electrical Conductors and Cables"; "Methods of Measurement of High Electrical Pressures"; "Some Comments on Remarks

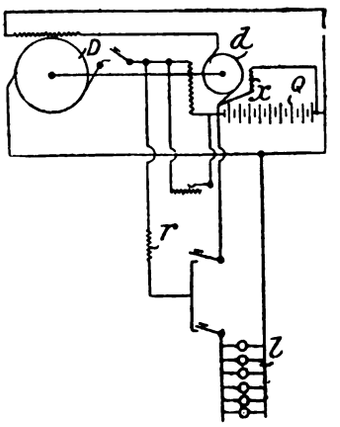
Digitized by Google

made by Colonel R. E. B. Crompton before the International Electrical Congress at St. Louis"; "Three-Phase Traction"; "Heavy Electric Freight Traction"; "Weight Distribution on Electric Locomotives as affected by Motor Suspension and Drawbar Pull"; "Choice of Motors in Steam and Electric Practice"; "Electrical Features of Block Signalling"; "Limits of Injurious Sparking in Direct-Current Commutation"; "A Study in the Design of Induction Motors"; "Limitations in Direct-Current Machine Design"; "A New Instrument for Measuring Alternating Currents"; "Synchronous Converters and Motor-Generators"; "Water Powers of the South-Eastern Appalachian System"; "A New Induction Generator"; "The Development of the Ontario Power Company"; and "A New Carbon Filament." There are also papers on "Standardisation of Enclosed Fuses," by H. A. Lacount and "Air-Gap Flux in Induction Motors," by A. S. Langsdorf.

Milan Exhibition.—This exhibition will be opened on April 15 next, under the patronage of the King of Italy. The exhibition will be divided into nine international and one national section. France, Germany, Austria, the United States, and other leading countries have decided to participate, and a British commission has been formed, under the auspices of the Government, which has made a grant of £10,000 for the creation of a British section. In spite of the shortness of time at its disposal the commission has been fortunate enough to secure in the various buildings space which, both in regard to area and position, will place this conntry upon an equality with the various other foreign nations who will participate. The importance of this country taking a prominent part in the exhibition will be evident to manufacturers who have watched the gradual decrease of their trade relations with Italy and the corresponding growth of German and French imports. In a circular letter from the Anglo-Italian Chamber of Commerce British manufacturers are assured that goods from this country of the best quality are still preferred in Italy to any others. The opportunity afforded by this exhibition of comparison with the manufactures, and sometimes imitations, of other countries should not be lost. There is in particular a splendid field for machinery of the latest type, Italy having entered on a period of great prosperity and her purchasing power having largely increased. Space in the British section is available at 2s. per square foot, and it is to be hoped that electrical manufacturers will utilise this opportunity of demonstrating their latest improvements.

Cooking by Electricity.—The possibilities of electrical cooking were exemplified at Olympia on Monday evening, when the committee of the Electrical Exhibition gave a dinner, cooked entirely by electricity, to a number of Press representatives and others. The dinner was held in the lecture hall, and the courses were prepared in view of the guests by Mrs. Deane on the usual kitchen appliances which serve for her daily demonstrations. It was a remarkable testimony to the advantages of electrical cooking that no odour or fumes from the ovens and other apparatus could be detected. Mr. E Cunliffe-Owen, the chairman, said that was the first occasion in this country when such a large dinner, all cooked by electricity in the dining-room, had been held. If it had been prepared by any other method, he thought the guests would have lost their appetites before they began. There were 65 present and 56 units had been consumed, so that the whole cost of cooking at 1d. a unit was 4s. 8d. The supply companies had met the question of electrical cooking in a liberal spirit, and it remained for manufacturers to follow their example. At present some of their apparatus was dear, but they would be able to produce cheaper articles with the growing impetus towards this method of cooking. It had been looked on hitherto as a costly fad, but that dinner served to show that it was the best and cheapest form of cooking. He believed that the present exhibition would do for cooking what the exhibition at the Crystal Palace in 1892 did for electric lighting. Radiators were already supplying heat at 1d. per hour, and it was evident that there was a very large future for electric heating and cooking.

Regulation of Variable-Speed Dynamos.—A patent has been obtained in this country by the Compagnie Générale d'Electricité de Creil, Paris, for a method of obtaining a constant potential from a variable-speed dynamo for charging accumulators, train-lighting, etc. The system is designed as an improvement upon that for which the company had previously lodged a specification, the object being attained in that instance by arranging a small auxiliary generator in the field circuit to control the



excitation. In the present arrangement an additional exciting coil, x, is arranged on the field of the auxiliary generator, d, and is in shunt with the accumulators, Q. Means are also provided in the case of train-lighting for supplying the lamps direct from the dynamo. In the arrangement shown the lamp circuit, l, is connected through a resistance, r, with the dynamo circuit, switches being provided for connecting the lamps either with the dynamo or the battery.

Electric Tramways in Germany.—The statistics concerning German electric road lines show that during the 12 months ending Oct. 1, 1904, the towns provided with such services increased by four. The length of route increased by about 60 miles, representing a total of 2,375 miles. The total output of the generating plant has increased only by about 1½ per cent., while the total output of accumulators on traction load shows a somewhat greater increase, the total accumulator capacity installed amounting to 39,809 kw. In explanation of the small increase in generator output, it may be mentioned that the plant of the Hanover tramways has been reduced from 10,063 kw. to 4,555 kw. It appears that there is a strong tendency to abandon the conduit and accumulator systems in favour of the overhead, which, on account of its economy, promises to become general practice. It has also been found in Germany that the conduit system is less reliable than the overhead. Mixed working by trolley and accumulator cars is retained only in Dresden, while trolley working in conjunction with sections of conduit line exists in Berlin, Dresden, and Düsseldorf. Entire accumulator traction is retained only on a short section of line in Bremerhaven, which will shortly be converted to the overhead system. In this connection it is interesting to note that on railways the accumulator system has not only maintained its standing, but has even been extended.

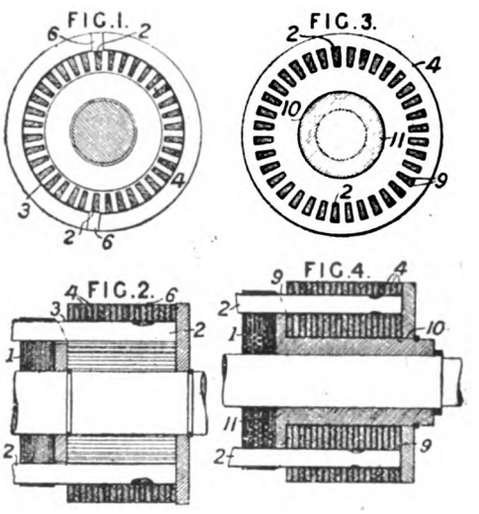
Digitized by Google

Single-phase alternating-current continues to gain ground. Owing to the successful trials on the main-line section between Niederschöneweide-Spindlersfeld, this system has been adopted for the Hamburg-Altona Railway, and it has been substituted for three-phase on the Murnau-Oberammergau line. Trackless cars are stated to give satisfaction and to promise commercial success, though definite figures are not yet available. Six routes are worked on this system, the cars being used chiefly for goods.

Magnetic Survey of the North Pacific Ocean.—The Department of International Research in Terrestrial Magnetism of the Carnegie Institution of Washington is about to make a magnetic survey of the North Pacific Ocean, and the *Scientific American* contains some interesting particulars relative to the expedition. The brig "Galilee," a wooden sailing vessel, has been fitted out at San Francisco for the expedition. The purpose of the expedition is to get exact data of the distribution of magnetic forces over the ocean, the present magnetic charts used by navigators of the North Pacific depending chiefly upon observations made on islands and along the coasts. Observations of this kind are subject to disturbance by local conditions, so that the charts now in use are not trustworthy. It is thought that the work can be accomplished in three years, and the sum of £4,000 has been allotted for the expenses of the first year. The "Galilee" will first cruise from San Francisco to San Diego, thence to Honolulu and back to San Francisco. Then a circuit will be made from the west coast of America to the Galapagos Islands, and thence to the Philippine Islands and Japan, returning by way of the Aleutian Islands and closing the circuit at San Francisco. The observations will be continued over a series of areas bounded by parallels of latitude and meridians of longitude each 5deg. apart, lying next on the mid-ocean side of the circuit last made, proceeding gradually and by successive circuits into the central region of the North Pacific Ocean. The whole length of the course proposed is 70,000 knots. The work is directed by Dr. L. A. Bauer, who is in charge of the magnetic work of the U.S. Coast and Geodetic Survey. He will accompany the expedition to San Diego. The scientific head and commander is Mr. J. F. Pratt, of the U.S. Coast and Geodetic Survey, who has had 30 years' experience in geodetic, astronomical, hydrographic, and magnetic work.

Moral Qualifications of Engineers.—In the editorial columns of the September issue of the *Club Journal* (Philadelphia) Mr. Charles F. Scott quotes an engineer of wide experience as saying that in selecting young engineers for specific work he found a greater number were lacking in moral qualifications than in technical ability. He did not restrict the term "moral" to mean simple, common honesty, but used it in a broader sense to include courage, judgment, backbone, moral strength, and all those things which make up the complex called character. Commenting on this, Mr. Scott remarks: "College courses are apt to give 99 per cent. to technical subjects and 1 per cent. to culture studies. Were the divisions 85 per cent. and 15 per cent., one would be decreased by only a seventh, while the other would be increased fifteen-fold. When older men talk about the value to an engineering student of a debating society, of familiarity with parliamentary practice, of fluency in composition, of culture studies, of the training in effective co-operation which may be secured through student organisations, of education as a means of forming right habits and developing the faculties as well as acquiring technical knowledge, the student in engineering does not seem to understand what they mean. The development of this broader side of life must be, after all, a matter of individual choice and effort. Others may counsel and may inspire. The result depends upon the man himself, upon what he chooses to bring within the range of his experience and upon the success with which he assimilates that experience in his growth. No one who has caught the spirit of the modern engineer will think that this applies to school days only. The principle of progress is to keep on. The idea is not static but kinetic, as well for the individual as in society and science and engineering." One can appreciate Mr. Scott's observation that purely technical knowledge should be supplemented by other accomplishments in order to evolve the perfectly competent engineer; but, considering the disparity he names in the amount of attention paid to the two branches in college courses, his compatriots must be congratulated upon their engineering achievements. At the same time it is gratifying to recall that "culture" is one of the subjects in which, according to the report of the Mosely Commission, the British engineer scores.

Field Magnets.—A patent has been granted to Mr. M. Walker, of Manchester, relating to ring-end connectors on the revolving parts of dynamos intended to be rotated at a very high speed. Dynamically-balanced ring connectors, marked 4 in Figs. 1 and 2, which we reproduce from the



Official Patents Journal, are shrunk or pressed over the hard insulating bush, 3, or strips of hard insulation, which cover the ends of the conductors, 2, which project beyond the laminated core, 1. The rings are insulated from one another, and each electrically connected to two or more of the conductors, 2, by soldering or by means of flexible strips, 6, of sheet copper. In the modification shown in Figs. 3 and 4, the conductors, 2, pass through slots punched in the rings, 4, which are mounted on an insulating bush, 10, surrounding either the shaft or a cylinder, 11, attached to the shaft, each of the conductors being covered with hard insulation, 9. The hard insulation may consist of mica or other good material for resisting compressive stress. The provisional specification also states that the connectors may take the form of straight bars at right angles to, and having their middle points in, the axis of rotation, or of a combination of a ring with two or more bars.

Imperial Consolidation by Telegraphy.—Mr. Charles Bright, F.R.S.E., contributes to the *Monthly Review* an article on this subject, in which he urges the importance, on political as well as on strategic grounds, of the outlying portions of the Empire being brought into direct telegraphic communication free from the prospect of "eavesdropping." The author points out that the

Digitized by Google

Pacific Cable, though all-British, is open to interruption in the event of war, as the connecting links are by means of submarine cables and land wires, besides which the terminal rates in Australia are out of all proportion to what they should be. At the same time he emphasises the contention that the all-British Pacific line was only justified (*a*) as a political and strategic necessity, and (*b*) because the companies would not undertake it themselves. Thus, while advocating all steps which will render the route strictly all-British, the author deprecates any proposal that would involve the expropriation of the existing cable companies. Such a step he considers would almost certainly prove a false step, as the companies, whose functions are essentially different from those of the proprietors of inland telegraphs, have to act somewhat in the position of diplomats in regard to their cables landing on foreign territory; and if once the Government took over all the cables belonging to the companies, Mr. Bright predicts a deadlock in regard to English cable developments with foreign countries. Apart from this the author is averse to the State acquisition of the companies' cables on commercial and economic grounds, and he also alludes to the unfairness of expropriation, as the shareholders risked their money at a time when such investments were hazardous. While contending that it would be unwise as well as unfair for the Government to step in as general traders in the matter of submarine telegraphy, the author expresses the hope that the companies will see their way to lowering their tariffs, and that no agreements will be entered into by the State in future without such being provided for on a sliding scale. The author ventures to think that such reductions will in the long run benefit the companies as well as the public. Although, as stated, Mr. Bright is opposed to the State taking over the existing cable service as a commercial business, he considers that there are overwhelming arguments in favour of a single trunk system of cables all connecting up the more important points of the British Empire under direct control (by ownership) of the State. The all-British Pacific cable was but the first step in this project for girdling the entire Empire. It is the author's view that a comprehensive system of this character, designed especially for Government service rather than as a competitive commercial concern, is a political and strategic necessity of the age.

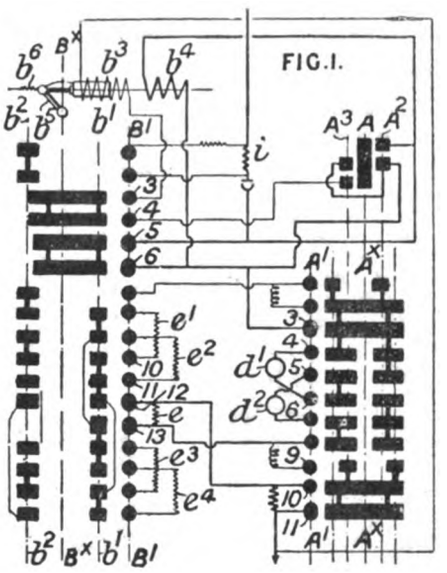
The Specific Resistance of Electrolytes.—At the recent meeting of the American Electro-Chemical Society a paper by Mr. R. Threlfall, entitled "A Standard Method of Determining the Specific Resistance of Electrolytes," was presented, an abstract of same appearing in the *Electrical Review* of New York. The author's experience has convinced him that no method hitherto proposed affords so direct and accurate a means of comparing the specific resistance of an electrolyte with that of mercury as by the use of the potentiometer. His measurements have been made with a potentiometer the accuracy of whose coils was guaranteed to two parts in 10,000. The essential part of the apparatus consists of a glass tube 98·6cm. long, and with a mean diameter of 0·9254cm., as ascertained from two careful weighings of mercury. The tube was slightly conical, and was assumed to be so regularly. Two reference marks were made near the two ends of the tube by coating it with wax and holding the edge of a sharp chisel against it as it revolved slowly on a lathe. The fine circular lines were etched by hydrofluoric acid, and were found to be 87·155cm. apart. This tube contained the electrolyte under investigation, and fitted into two glass T-pieces, one at each end. The vertical branches of the T's gave access to the platinised electrodes, while the horizontal branches were used to fix the position of the testing electrodes of the glass tube drawn down to long, fine points. The testing electrodes were merely held in position by rubber bungs, strongly compressed, and were adjusted so that the free ends lay exactly in the same cross-section as the reference rings. The testing electrodes were connected in the usual way through two beakers containing respectively the solution under examination and the liquid used in the Oswald normal electrode. By turning glass cocks the siphons could be put out of action, and diffusion stopped. The tube containing the electrolyte was immersed in a large bath containing heavy mineral oil, and provided with a heating coil running the whole length, and a shaft with screw paddles also running the whole length of the trough. As comparison resistances, standards certified by the Reichsanstalt at Charlottenburg were employed, and, of course, care was taken to have the resistance of the standards and electrolyte so adjusted that about the same voltage was operative over each part. By substituting mercury for the electrolytes a comparison is easily made. The development of an accurate and easy method of determining the resistance of electrolytes suggests the possibility of making electrolyte standards of resistances. Prof. C. F. Burgess described a simple method for making quick and approximate measurements of the resistance of electrolytes. A long tube is filled with the material, and attached to this tube at points whose distance apart is accurately known are two tubes, into which are inserted Ostwald normal elements. A thermometer is placed in the electrolyte itself; this is an important feature. No polarisation takes place, so that readings may be taken instantaneously. Mr. Carl Hering expressed gratification at the return to direct currents for measuring the resistance of electrolytes. He suggested the use of gold electrodes, as these do not polarise.

Load Factor.—At the twenty-fourth annual convention of the American Street Railway Association the effect of load factor upon the cost of operation was the subject of an interesting paper by Mr. L. P. Crecelius, of which an abstract appears in the *Electrical World* of New York. Evidence is given to show the advantage of interconnecting several stations by means of 'bus bars and shutting down certain ones completely during periods of light load. The author first discusses the character of the load on railway systems. In urban railway systems the load curve is double peaked, having the characteristic morning and evening peaks of city travel when the people go to and from work; the breadth, magnitude, and duration of these peaks depending, of course, upon local conditions, such as the size and lay-out of a town, and upon its sociology. In a manufacturing centre the peaks are often remarkably symmetrical, and are little affected by climatic conditions, as the people usually go to work at about the same time in the morning and leave to go home at nearly the same time in the evening. In the larger cities, where it becomes necessary to transport a mixed community consisting of factory employés, merchants, clerks, shoppers, theatregoers, etc., the peaks lose their symmetry, the morning peak becoming lower and not so sharp as the evening peak. The writer describes the system of the United Railways of St. Louis, which has in operation four power stations. Two of the larger stations, one of 13,950 kw. and one of 7,000 kw. capacity are kept in operation continuously, and constitute the main central stations. The two smaller stations are operated on swing watches on weekdays—that is, operated during the peak hours only. 'Bus wires have been run from the larger stations to both of the smaller ones, and there connected through circuit breakers and double-throw

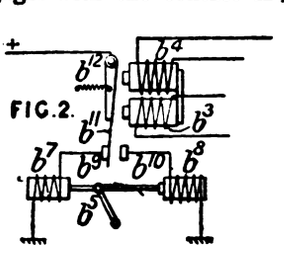
Digitized by Google

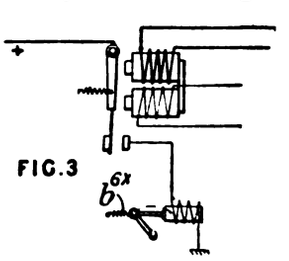
switches to either one of the two feeder 'buses, with which the smaller stations have been supplied. Installing double-throw switches the feeder sections can be connected. During the rush hours the 'bus wires are connected to the same 'bus on which the stations are operated, thereby becoming equaliser wires. The amount of copper in the 'bus wires is just sufficient to carry the load of the smaller stations during the lighter part of the day, allowing a reasonable drop in potential. The resulting economy of operation in this case more than justifies the expenditure of a good many dollars in the 'bus wires, and also the resulting increase in the cost per kilowatt-hour of the power generated under this arrangement in the smaller stations. Thus it is found that in bringing up the load factor of the main stations from 50·23 per cent. in the first case to 57·7 per cent. in the second, that a saving of ·0002875d. per kilowatt-hour has been made on the total power cost. And on a basis of 310,000 kilowatt-hours per day, which is about the average output of the stations of this system during the summer months, this would represent a saving of £36 per day when operating under these conditions. It has been found that since the installation of a storage battery, which is located in the business district of the city where the traffic is very congested, the character of the service has been improved to a marked degree during the rush hours. Also a large reduction in the amount of copper required to handle the sections located in this district from the four stations has been effected. This, together with the fact that a battery can always be called upon in cases of emergency to take hold of the load, points to the advantages to be derived in using storage batteries to smooth up the load curve when conditions warrant their use. In discussing his own paper, Mr. Crecelius stated that no difficulty is experienced in arranging for the operating force of the two small stations to report for duty twice per day during the morning and evening rush hours. Mr. H. Le H. Smith called attention to some of the more important items that depend upon the load factor. These include the electrical losses, the radiation losses from the stack, and the inability of automatic stokers to respond readily to rapidly fluctuating loads or to be adjusted for a great range of load. He thought a better definition of load factor than the ratio of average to maximum load could be found in the ratio of the actual energy developed to the maximum possible output of the station. The latter definition is the one accepted generally in this country.

Motor Control.—A patent has been granted to the Johnson-Lundell Electric Traction Company for a method of regulating motors, which is described in the *Official Patents Journal*. It is particularly applicable to the system patented by the grantees two years ago, in which the motors are connected up as series motors while propelling and accelerating the vehicle, and as compound-wound generators while braking the vehicle. The handle of the controller, A×, is provided with a contact, A, and is capable of a certain amount of free movement in either direction independently of the controlling cylinder, so that the contact A may be brought into engagement with either of the contacts, A^2, A^3, carried by the controller, the handle being held by springs in its normal position between the contacts A^2, A^3. With the contact b^1 of the field-change cylinder, B×, in engagement with the fixed contacts, B^1, the motors are in their series condition, while the regenerative condition is obtained by rotating the cylinder, B×, so that the contacts b^2 engage with the contacts B^1. The device by which the field-change cylinder, B×, is actuated consists of a solenoid provided with a shunt coil, b^3, and a series coil, b^4, the core being connected to a crank-lever, b^5, connected with the cylinder, B×, and to a spring, b^6, or to a weight. When the motors are in their series condition, as represented by Fig. 1, the current from the trolley passes through the resistance, *i*, contacts 5, 6 of the row B^1–B^1, contacts 3, 4 of the row A^1–A^1, armatures d^1, d^2 to contact 13, thence in parallel through the fields e^1, e^2, e^3, e^4, *e* to contact 12, and finally to ground through contacts 10, 11 of row A^1–A^1. If, now, the handle of the controller be moved so that the contact A engages with the contact A^3, the controller cylinder remaining stationary, the circuit through the shunt coil, b^3, is completed. The field-change



cylinder, B×, is thereby turned into the position in which the contacts b^2 engage with the contacts B^1, thus converting the motors into their regenerative condition, at the same time breaking connection between the contacts 5, 6, and thus compelling the generated current from the motors to pass through the series coil, b^4, and also breaking the circuit of the shunt coil, b^3, between the contacts 3, 4. If, now, the current generated by the motors falls below a predetermined value, the spring b^6 returns the cylinder, B×, to the position b^1–b^1, in which the motors are in the series condition. Should the motor man turn the handle in a forward direction when the motors are in their compound condition, the contact A× engages with the contact A^2, thereby short-circuiting the





coil b^4, and thus allowing the cylinder, B×, to return to the position b^1–b^1. The cylinder, B×, also returns to the position b^1–b^1 should the connection between the motors and the source of supply become broken, for in such a case the coil b^4 is immediately de-energised. Figs. 2 and 3 represent modifications of the device for actuating the cylinder, B×. A tongue, b^{11} (Fig. 2), is held in its normal position against a contact, b^9, by a spring, b^{12}, or by a weight, the coil b^7 being energised by the main current. When either of the circuits of the coils b^3 b^4 is closed and the current is above a predetermined value, the tongue, b^{11}, is attracted, thereby engaging with the contact b^{10} and completing the circuit of the coil b^8. The coil b^7 may be replaced by a spring, b^6× (Fig. 3). An electric motor may be substituted for the coils b^3 b^4.

THE LANCASHIRE ELECTRIC POWER COMPANY.

It is not long since we announced the inaugration of a supply of electricity from the Thornhill generating station of the Yorkshire Electric Power Company, and now we have to chronicle the opening of the power station which has been erected by the Lancashire Electric Power Company at Radcliffe. Thus events in connection with the supply of power over wide areas are moving apace, and the near future will show how far the promoters' sanguine expectations are capable of realisation. Meanwhile the prospects are sufficiently encouraging to warrant confidence in the ultimate success of their schemes.

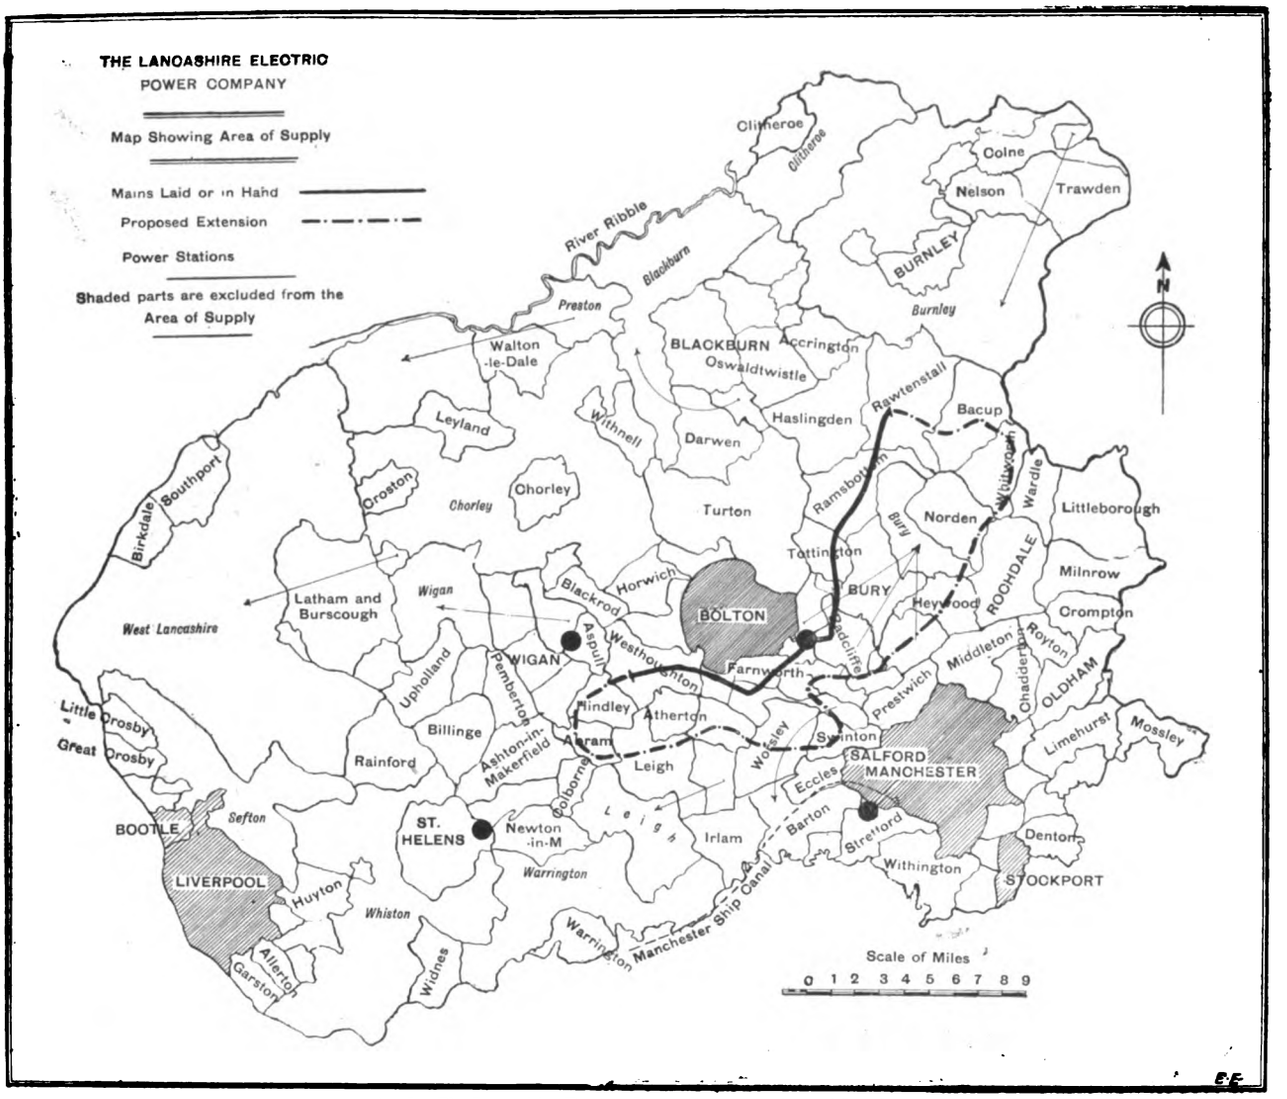

FIG. 1.—The Lancashire Electric Power Company's Area of Supply.

In its essential features the Radcliffe power station closely resembles the Thornhill model, but as this type is a strictly modern development we need not apologise for entering once more into fairly full detail. Accompanying is a map (Fig. 1) of the area within which the Lancashire Company have powers to supply, showing the present development of the 10,000-volt distribution from the Radcliffe centre, and the return lines of mains contemplated. In one direction the mains extend to a distance of some 15 miles. They are all run overhead from the power station to points at different radii, where they dip underground, in some cases to emerge for conveyance overhead by direct routes across country, and then dip again. We shall have more to say later on about this interesting feature of the scheme.

The selection of the site for the power station is a matter that has received very careful consideration, and the one chosen may well be considered ideal. The plot, which is 20 acres in area, and has been taken on long lease from the Earl of Derby, is situated on the left bank of the River Irwell, and is contiguous on the other side to the Lancashire and Yorkshire Railway. It adjoins the Outwood coal pit of Messrs. Thos. Fletcher and Co., Limited. Abundant condensing water and coal supply is thus assured. Another feature which renders this site particularly advantageous is the fact that the railway is some 50ft. above that part of the land on which the power station is built. This enables the coal to be taken from the truck to the grate entirely

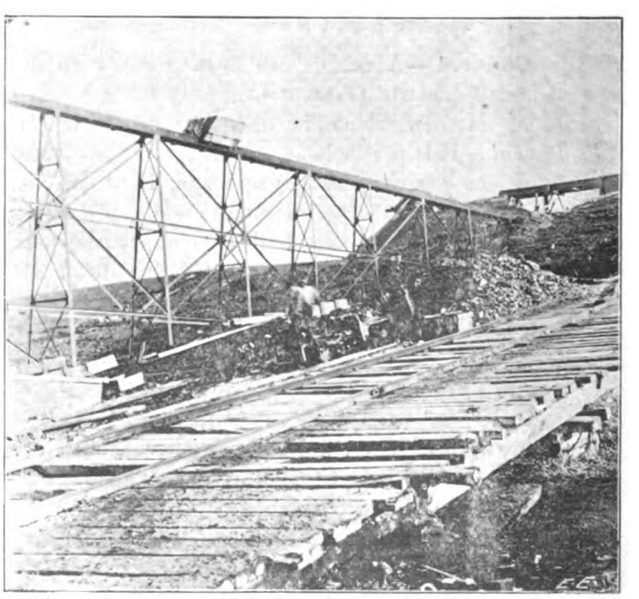

FIG. 2.—Radcliffe Power Station—Railway to Coal Bunkers.

by gravity, which force, costing nothing, tends to economy. Suitable sidings have been put down by the company,

Digitized by Google

parallel with the railway, and at the back of the boiler-house. Coal is conveyed from the pit mouth in trucks, and shunted on the power company's siding by an electric locomotive, to which is also fitted a 10-ton jib crane for tipping purposes. At the end of and under the siding a containing hopper is fitted, into which the coal trucks are emptied. Under this hopper, again, is a small railway running down an incline (Fig. 2) at right angles to the siding, and on this inclined railway is a small truck, into which the coal is weighed in one-ton lots from the hopper. Gravity then comes into play and takes the truck down the inclined railway into the top of the boiler-house and over the bunkers. Here a toggle on the truck engages with a trip set at the bunker it is required to fill, the sides of the bogie fall open, and it is emptied practically instantaneously, the empty truck being returned to its original position under the siding hopper by a falling weight, which had previously been lifted by the truck on its downward journey.

The power-house buildings (Fig. 3), consisting of boiler and turbine houses, are of steelwork construction, filled in with brick, built on a foundation slab of concrete 3ft. thick, stiffened by a grillage of steel girders (Fig. 4). This slab forms the floor of the basements. The turbine-house and boiler house floors are some 9ft. above this, and are composed of steel girders with concrete on corrugated iron formers.

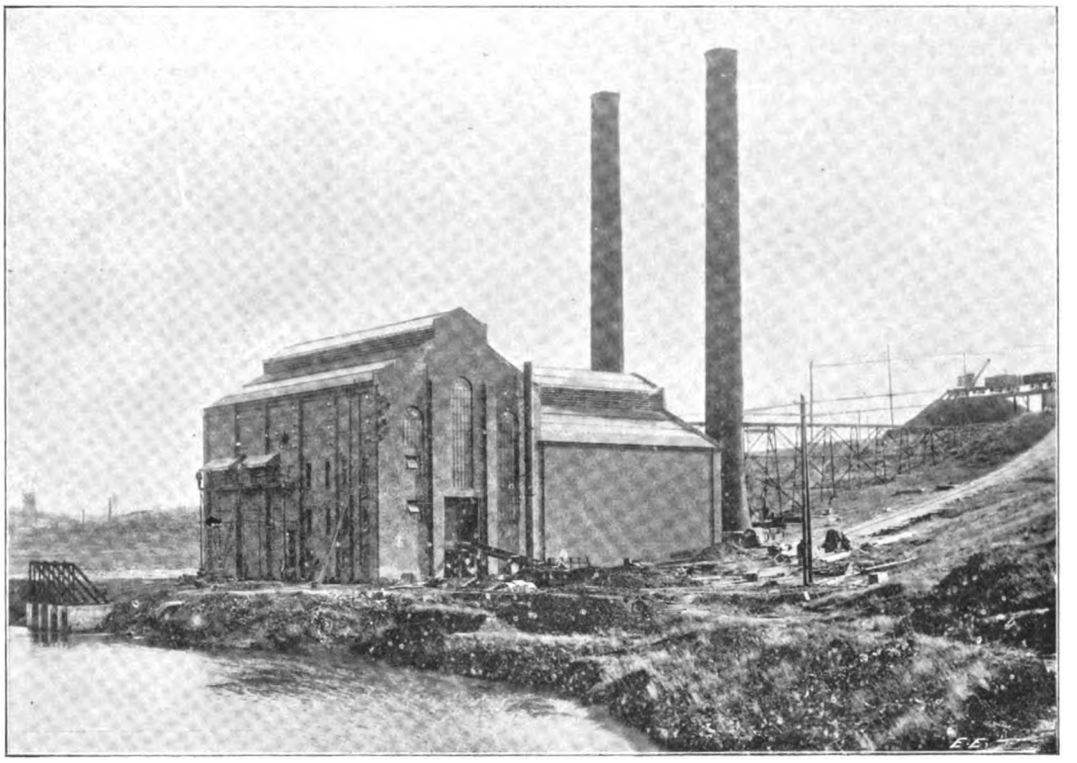

FIG. 3.—Radcliffe Power Station—Exterior View.

The dimensions of the boiler-house are 70ft. by 80ft., and of the turbine-house 100ft. by 50ft. These dimensions are remarkable, inasmuch as 8,000 kw. of generating plant is contained in the buildings. The coal is fed from the bunkers by shoots on to the grates. These are of the chain type, driven by electric motors. The boilers, of which there are six, are of the watertube type, with superheaters, made by Messrs. Babcock and Wilcox. Each is capable of evaporating 20,000lb. of water per hour from 60deg. F., to steam at 160lb. per square inch pressure, and 150deg. F. superheat. The heating surface of each is 5,730 square feet, and the grate area 100 square feet. They are arranged in two banks of three, one bank on each side of the boiler-house, as shown in Fig. 5. Each bank has

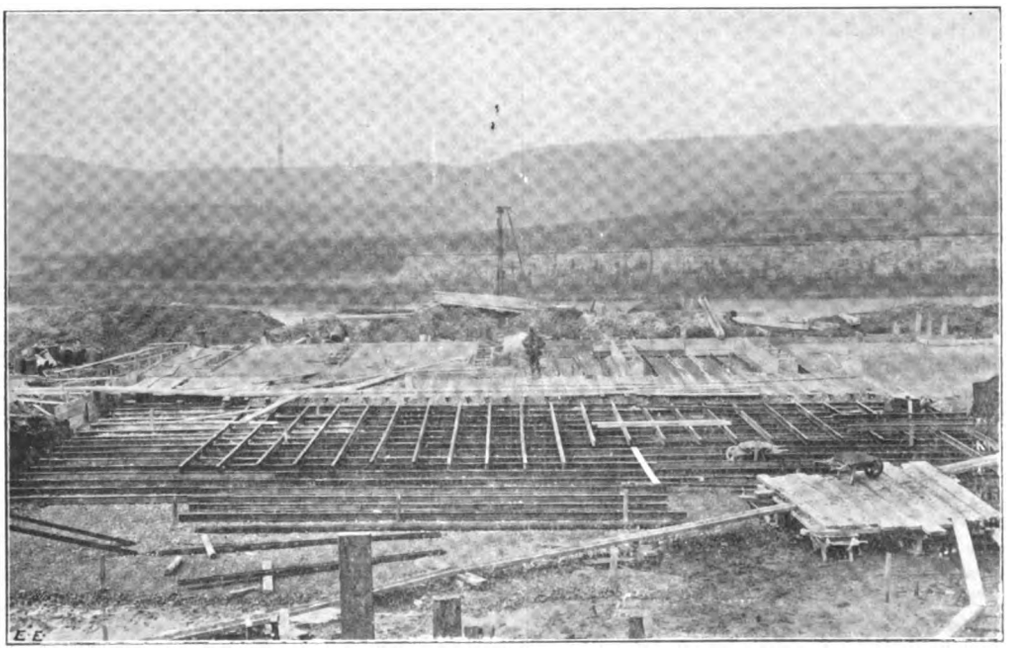

FIG. 4.—Radcliffe Power Station—Foundation in course of Construction.

Digitized by Google

its own flue beneath the boilers, which is led out to its own brick-lined steel chimney, 150ft. high and 10ft. diameter. The ashes and clinkers fall from the back

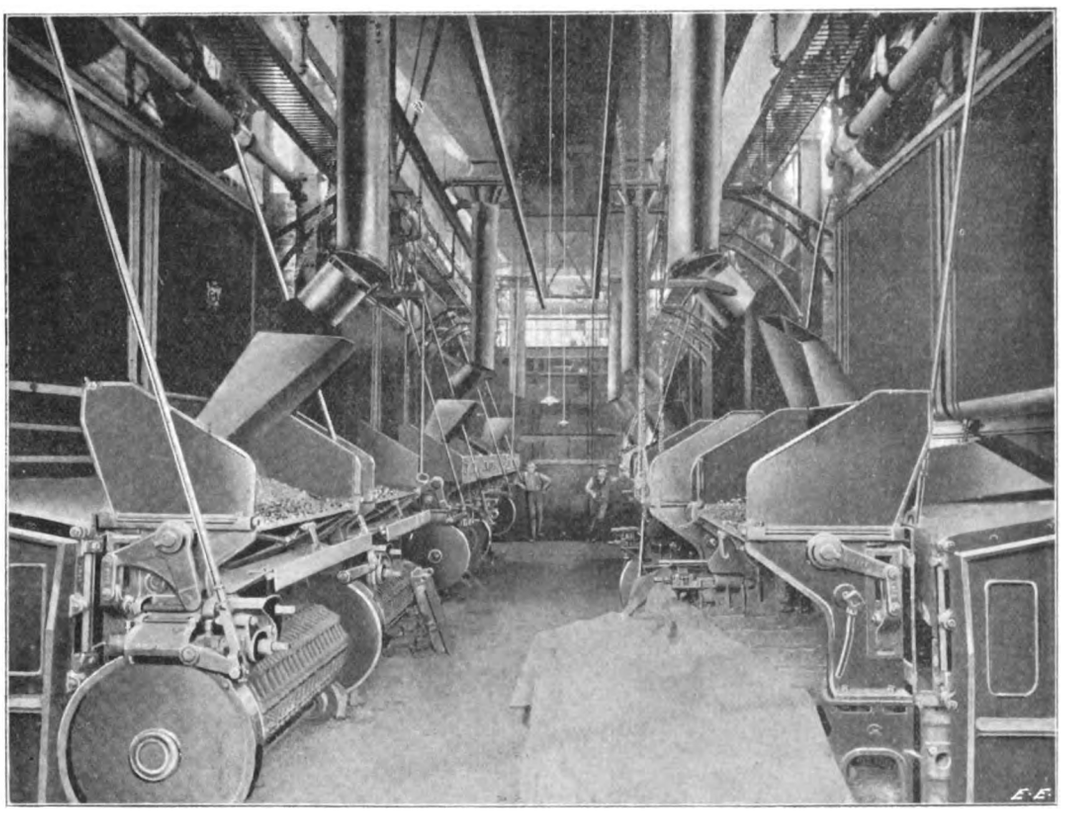

FIG. 5.—Radcliffe Power Station—Boiler House.

of the chain grates into the basement, from which they are taken away in trucks on an industrial railway. The hot-wells are in duplicate at the turbine-house end of the basement. There are no economisers, the feed water being heated by the exhaust from the exciter sets. The make-up water is taken from the mains of the Bury and District Joint Water Board. The steam from each boiler is fed into a ring of piping, so that in case of mishap the steam can be fed either way round the ring to the turbines, etc. The steam is brought through the wall dividing the engine-room from the boiler-house, each turbine being fed direct from the steam ring in the boiler-house. A branch is also brought through for feeding the exciter sets.

The main plant (Fig. 6) in the turbine-house consists of four Curtis turbo-generators, made by the British Thomson-Houston Company, each having a capacity of 2,000 kw., running at 1,000 r.p.m., generating three-phase current at 10,000 volts and 50 cycles. Each set consists of a vertical steam-turbine and an alternator, the spindle which is driven in the turbine being in the same line, and directly coupled to the driven spindle in the alternator. For the benefit of those who are not already familiar with the Curtis turbine* it may be explained here that steam is admitted continuously, being brought to a series of nozzles on the casing of the machine, where it expands, and in doing this loses pressure, of course, but gains speed. After passing these nozzles it impinges on the rotating element, which consists of a series of diaphragms keyed on to the spindle and with buckets cut on the periphery. These buckets are shaped like the crescent moon in section, being some 2in. to 5in. deep, while their axis lies in the line of rotation, and not (as in other turbines) at a slant. A motion is thus transmitted to the moving part, the steam passes to somewhat similar buckets fixed in the case, then through four such sets of diaphragms, increasing in size as the pressure is reduced, and, finally, on to the condenser in the ordinary manner. The regulation is both mechanical and electrical, the nozzles are controlled by electrically-operated valves, the governor lifting up contact fingers on a controller allowing a greater or less number of nozzles to be open. The final regulation is obtained by the actual adjustment of the last valve. By this means a speed of remarkable constancy is attained, the variation being as small as one-tenth of one per cent. The constancy of the angular velocity and the small speed variation are quite remarkable and phenomenal. This steadiness it is hoped will prove of great utility to the manufacturers of the county.

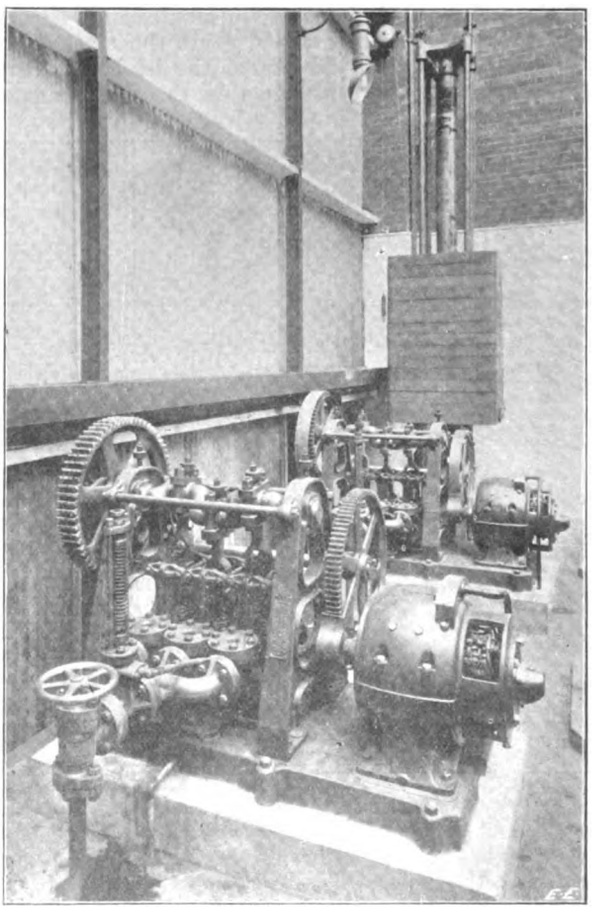

FIG. 7.—Radcliffe Power Station—Water Accumulator.

The turbines being vertical, the whole of the weight of both the turbine diaphragms and also of the rotating

* For a full description of the Curtis turbine, see *Electrical Engineer*, vol. xxxv., p. 690.

Digitized by Google

element of the alternator is borne by the vertical spindle. The step bearing on which this rotates is of a very special construction. The bottom end of the spindle is finished flat, and rests in a cup-shaped bottom block, which is capable of being raised or lowered by means of a suitable screw. Through the centre of this block is bored a hole, and this is fed with water at a pressure of 400lb. to the square inch. This raises the spindle from the block, and the water comes out in a constant film, about one-thousandth of an inch thick, escaping round the top of the cup. Practically frictionless bearing is thus obtained. Water at the requisite pressure is provided by two force pumps, one capable of dealing with all the turbines and one a spare. These are three-throw pumps, and electrically driven. As it is of utmost importance that the water should not fail, there is a water accumulator (Fig. 7), which consists of a hydraulic ram provided with heavy weights, and is so arranged that, if the pump fails, the accumulator gives the supply, at the same time ringing an alarm bell, giving ample time for the attendants to start up the spare plant. The condensers are placed right against the turbines, and the air-pumps are directly beyond; the whole making very compact units. These condensers are of vertical type with very ample surface, so as to obtain a high degree of vacuum; they are by the Mirlees-Watson Company, while the air-pumps are Edwards's three-throw type, and driven direct by motors.

The excitation for the turbines, as well as the current for all the auxiliary plant, is obtained from three reciprocating high-speed engines by Allen, of Bedford, direct coupled to B.T.-H. dynamos. They each have an output of 150 kw., and run non-condensing, the exhaust heating the feed water as mentioned in the foregoing. In the turbine-house is also a dry-air pump; this keeps the water part of the condensers free from air, and keeps the circulation good by maintaining a syphonic action in the circulating system. This pump also is used to prime the circulating pumps. There is a 25-ton electric crane, which travels the length of the turbine-house.

(To be continued.)

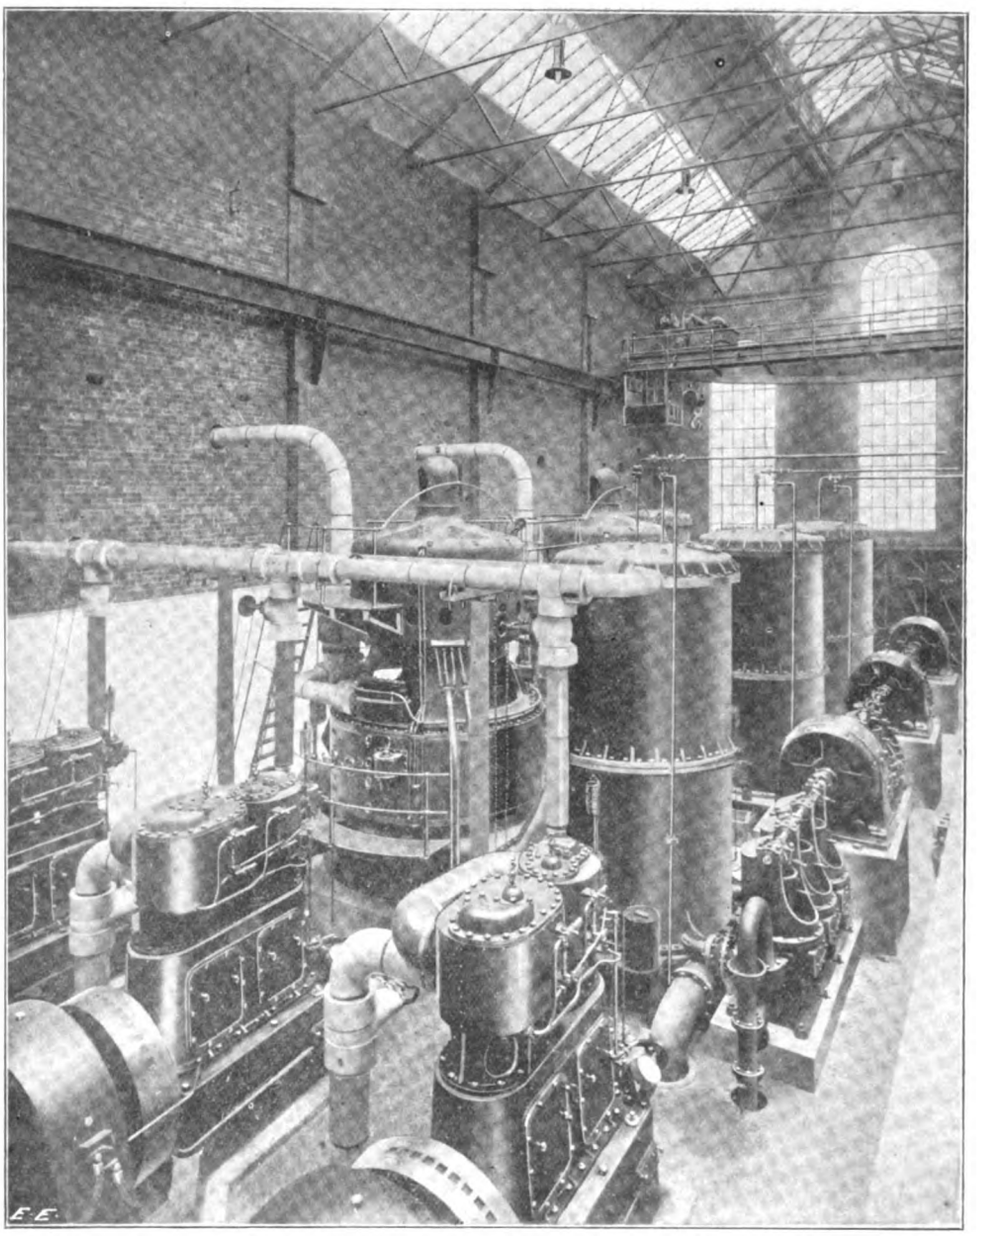

FIG. 6.—Radcliffe Power Station—Main Plant in Turbine House.

THE HASTINGS ELECTRIC TRAMWAYS.

On Tuesday last, through the courtesy of the contractors (Messrs. Dick, Kerr, and Co.), we were privileged to inspect the electric tramway system which they have constructed in the Hastings district. The company owning the system is the Hastings and District Tramways Company, and they have secured from time to time extensive powers for the construction of lines. Owing to the opposition which was brought against the schemes in Parliament, the construction of the same has had to be carried out in what may be termed the least economical manner. Thus it is along the sea-front that there is the greatest need for tramway facilities, and the construction of this line has to be delayed until the whole of the rest of the system is completed and working. The long circular route is now completed, and the line to Bexhill is under course of construction.

The company will shortly have this line to Bexhill com

Digitized by Google

pleted, but will be unable to get cars from one portion of its system to the other. We need hardly say that, while the company will be inconvenienced, the public will suffer to a considerably larger extent. The other feature in connection with the sea-front tramway is that under the Act it must not be constructed on the overhead trolley system. The actual system to be adopted has to have the approval of the Corporation, or, failing agreement, the approval of the Board of Trade, but under the Act the trolley system is barred. This leaves a choice between accumulator traction, the conduit system, and one of the many surface contact systems now on the market. Those who know the sea-front at Hastings will appreciate how unsuitable it is for the working of either of the latter alternatives. At high tides the sea frequently comes over into the road, bringing with it large quantities of beach and sand. In our opinion, the reasons for objecting to the overhead trolley system for the front are nothing like so strong as those which can be brought against any alternative proposal. We should not be surprised to hear that after the rest of the lines have been worked the Corporation will find their objections to the overhead wires disappear. In that case we trust they will assist the company in making the whole of the system uniform.

The circular route above referred to goes through Ore and the old London road to the Harrow, returning down the Saddlescombe-road, Silver-hill, and Bohemia. It is remarkable from many points of view. The grades and curves on it are such that they can be only dealt with by electric traction. The line at the highest part traverses a ridge commanding a splendid sea view in one direction and an extensive range of country in the other. The first parts of the route proceeding from the Memorial in either direction serve well-populated districts, which will provide a regular traffic throughout the year. Quite apart from this traffic, the scenery commanded by the route will make it a most popular one for visitors.

We propose to commence our description of the system at the power-house, which is situated at Ore. The area served is so large that high-tension transmission to sub-stations is absolutely necessary. In consequence of this the consulting engineers (Messrs. Kincaid, Waller, Manville, and Dawson) have installed a composite plant, which can deliver high-tension, three-phase current at 6,600 volts for supplying the distant part of the line, and direct-current plant to feed the lines near the power station. The three-phase current is transformed into direct current at the sub-stations placed on the outlying portions of the line.

The power station adjoins the Ore Station of the South-Eastern Railway, and a siding has been constructed between the railway and coal store to facilitate the supply of coal. The steam plant consists of three Babcock and Wilcox patent marine water-tube boilers, with a working pressure of 180lb. per square inch, each boiler being provided with a steam superheater fitted with all the usual accessories. Each boiler (*Fig.* 1) is capable of evaporating 14,000lb. of water into high-pressure superheated steam with natural draught. The superheaters—also of Babcock and Wilcox make—are so proportioned that an increased temperature of 120deg. F. can be maintained. The gases and products of combustion are carried through a main horizontal steel flue, constructed above and behind the boilers, into a self-supporting chimney, also of steel, 8ft. in diameter and 175ft. high, which has been erected quite clear of the building. The area of both flue and chimney is so proportioned as to admit of necessary extensions in boiler plant, which, judging by the appearances of traffic, will soon become necessary. The

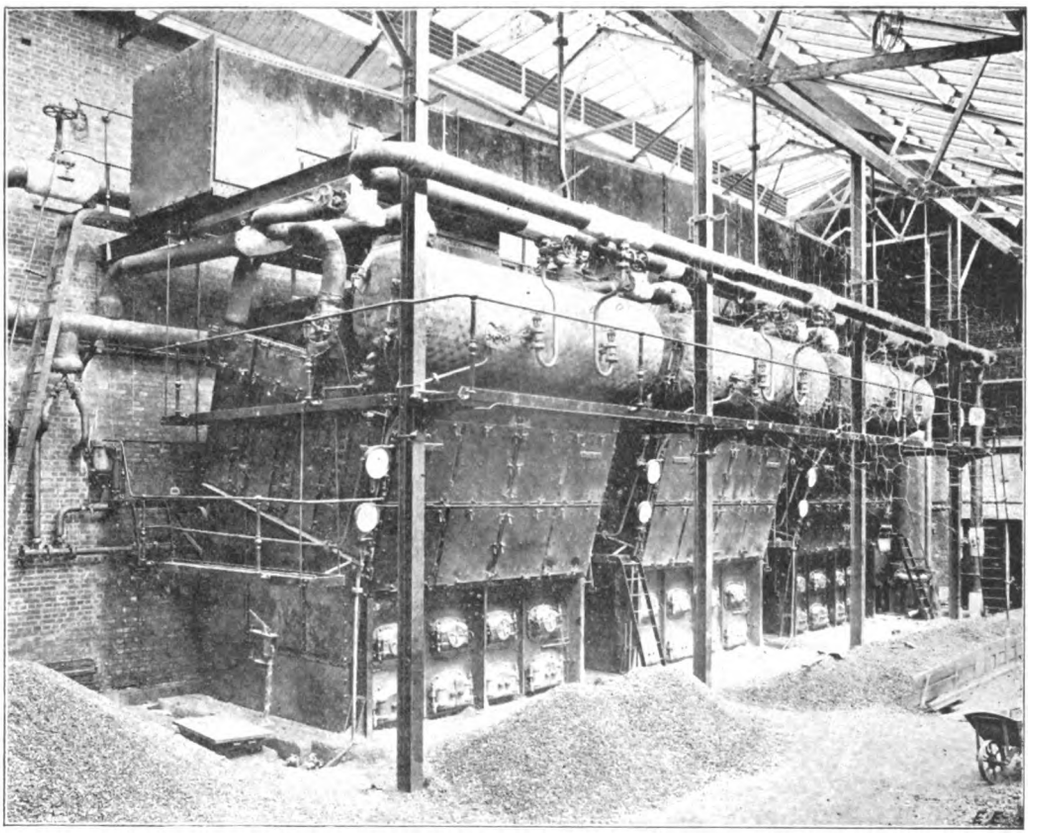

FIG. 1.—The Babcock-Wilcox Marine type Boilers in the Hastings Tramway Power Station.

feed-water supply is provided for by the erection of two of Messrs. J. P. Hall and Co.'s direct-acting, differential steam-pumps, which are housed in an annexe or pump-room, opening conveniently out of the boiler-room, and as each pump is capable under normal circumstances of dealing with from 30,000lb. to 40,000lb. of water hourly, there is ample provision for supply and reserve.

The pipe arrangement has been designed to give security against accident at the same time that alternative directions of supply are provided. The main steam-pipe is of solid drawn mild steel, 8in internal diameter, arranged on the "ring" system, the "ring" being divided up into a suitable number of sections by means of through-way valves, and one half of it is arranged vertically above the other the whole "ring" being suspended upon the boiler-house side of the wall which divides the power-house in two. Each of the boilers is connected by means of a 5in. pipe to the lower half of the main steam range, while each of the four steam-engines, already installed, derives its supply from the upper half of the ring main by means of branch pipes of the same bore as the engine steam inlet. The drainage of the ring has been amply provided for, as each section has its own particular draining pocket, in

Digitized by Google

addition to which a separate pocket is provided at each end of the ring to intercept any water which might be carried over on its way to the engines. It is hardly necessary to add that all these pockets are fitted with automatic apparatus for the instant clearance of such water as may reach them. We may add that automatic isolating valves are fitted into each separate boiler supply pipe, in order that security may be given against the far-away possibility of any local accident to a boiler.

handiness, and general utility as in the design of the hardly more important main range. We may add that the branch pipes to the auxiliaries from the secondary ring are all of copper, solid drawn, and having flanges of gunmetal brazed on. The bodies and covers are of Siemens-Martin acid-process cast steel, and those on the main ring are provided with by-pass valves to facilitate operation. Special attention has been paid to the design and construction of these valves because of the fact that they are required to work

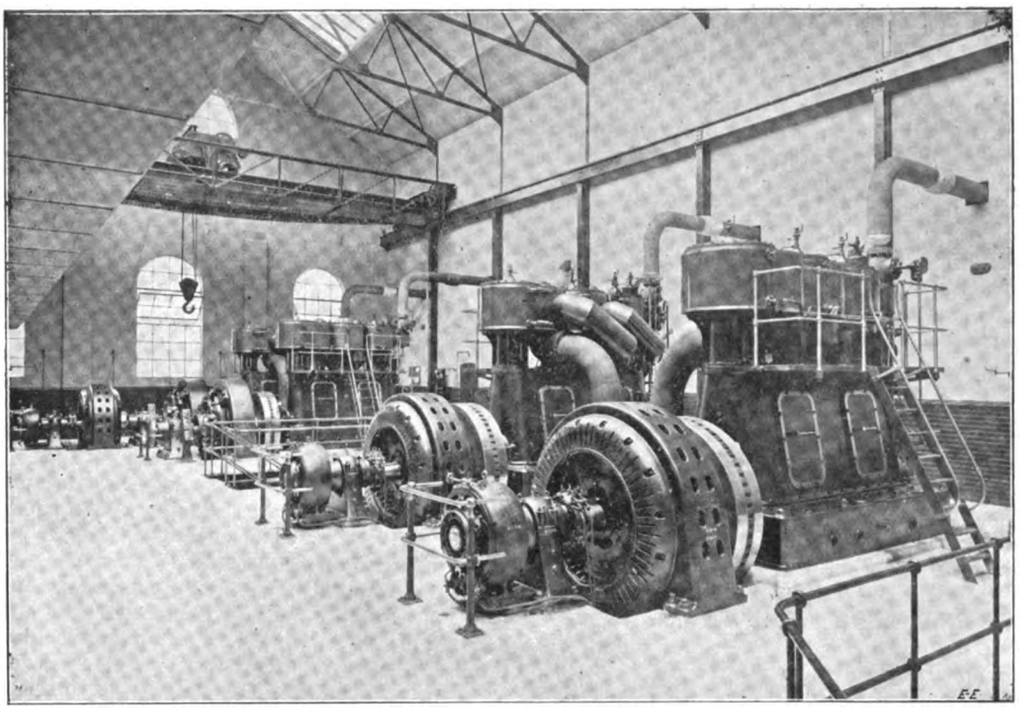

FIG. 2.—The Engine Room, showing the Belliss-Dick-Kerr Generators.

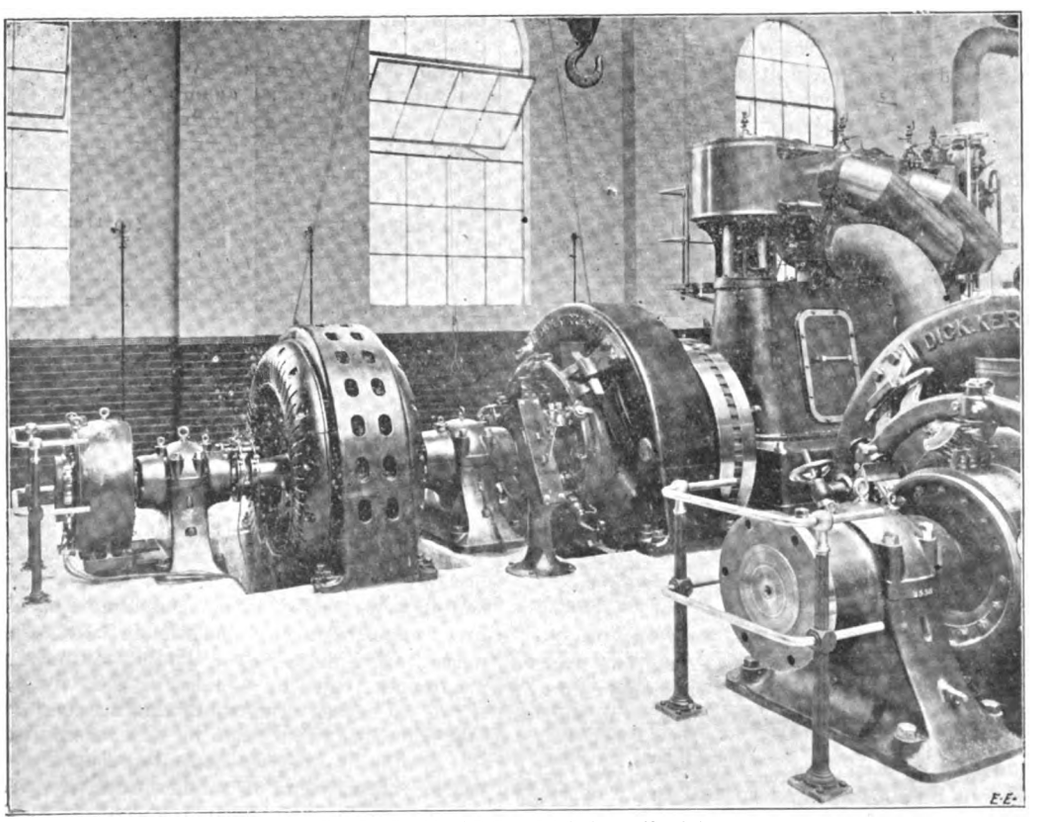

FIG. 3.—Combined D.C. and A.C. Generating Set.

Beside the main steam ring, a second of smaller diameter has been erected, through which steam is supplied to the feed-pump engines, the condensing engines, and other auxiliaries, and the small ring is a miniature of the main ring, its features being in all respects similar, and the same care has been devoted to considerations of safety, upon a pressure of 180lb. steam, superheated 120deg. F. The pipes are all covered with a composition containing 85 per cent. of magnesia, which is wired every foot, the whole being covered with plastic material, over which strong canvas has been neatly sewn and suitably painted. The feed suction and delivery and the whole of the pipe

Digitized by Google

cistern in connection with the condensers have been designed with the same care and the same considerations which were devoted to the steam system.

The steam, upon leaving the engines, is dealt with by a surface-condensing plant which has been supplied by Messrs. W. H. Allen and Co., and which has been erected in the basement of the engine-room. Its pumps are driven by means of a vertical, compound, enclosed high-speed steam-engine, the circulating pump being coupled direct, while the air-pumps are driven through a single-reduction system of gearing. The condenser is designed for dealing with about 30,000lb. of steam per hour and producing a vacuum to within about 4in. of the barometric pressure. The air-pumps are of the two-throw, vertical, single-acting "Edwards" pattern, and are worked from a pair of cranks upon a shaft, which is connected to the engine shaft through a raw-hide pinion gearing into a spur wheel. The circulating pump is of centrifugal type, and is capable of providing the requisite circulating water and delivering it to the distributing troughs of the feeding trays inside the cooling tower, which is of the Klein Company's usual standard construction. The pump casing and disc are of cast iron, the latter being carried on a steel shaft coupled direct to the engine, which runs, if necessary, at a speed of 425 r.p.m. The discharged water from the air-pumps is taken by means of a small pump driven by the same engine, and is delivered into the cleaning apparatus, from whence, freed from oil and other deleterious matter, it is taken once more by the feed pumps to recommence its cycle of operations.

The cleaning apparatus to which reference has just been made, and which is capable of dealing with the maximum amount of feed water required, is constructed upon the Davis-Perrett system, which combines an electrical treatment of water with a filter of the Wilson automatic self-cleaning type, as supplied and made by Messrs. Masson, Scott, and Co. In this process the condensed water is received in wooden treating tanks, divided by metallic electrodes which are so arranged as to cause the water to circulate from inlet to outlet, and in its passage it is subjected to the action of electric current, with the result that the emulsive character of the oily water is destroyed, the oil forming a flocculent precipitate with the oxides of the metal, which can be easily removed by a simple filter. A continuous current at a pressure of about 500 volts is used, the tanks being supported upon insulators carried upon an overhead platform within the boiler-room, and just above the pump annexe. A galvanised wrought-iron tank having a capacity of 1,000 gallons is installed for the reception of the clean water from the filter, and this tank acts as a hot-well from which the feed pumps' suction is taken, and into this tank such small make-up as is necessary is supplied from the feed tank.

The engines, of which there are four in number, are of the well-known Belliss three-crank, triple-expansion type, with forced lubrication. Each engine (Fig. 2) is capable of giving a normal output of 540 b.h.p. when running at a speed of 375 r.p.m. condensing or non-condensing, with a steam pressure of 175lb. per square inch at the stop valve.

The electrical plant consists of three of Dick-Kerr's standard alternators and two of the same firm's standard direct-current generators, all machines being designed for coupling to high-speed engines. Two alternators and one direct-current generator are each direct coupled separately to a Belliss engine, the fourth engine (Fig. 3) driving an alternator and generator coupled together so as to form a reserve in case of the breakdown of either an alternating-current or a direct-current unit. The alternators generate three-phase current at 6,600 volts, 25 cycles, each machine being provided with a direct-driven exciter. They are designed for a continuous output of 300 kw., and to sustain an overload of 25 per cent. for one hour with a moderate rise in temperature. The three alternators are designed to run in parallel with each other, means being provided for raising their voltage up to 6,600 when running at a constant speed to compensate for loss in the mains. The rotor spider is made of high-quality cast iron of a very strong design, the hub being provided with flange for bolting to engine flywheel, and is pressed on to the shaft by hydraulic pressure, and key seated.

The pole-pieces are made of laminated steel, and are held together between two cast-steel end plates of strong construction. The upper part is of a T-shape construction for holding the field coils in position; the lower part of the pole-pieces is dovetailed for fixing on the rim of the rotor and held in position by means of keys. The removal of the field coils is effected by sliding the pole-piece from the dovetailed groove parallel to the shaft without disturbing any other part of the machine. The design and shape of the pole-pieces gives a distribution of lines of forces in the air-gap to produce an approximately sinusoidal-shaped wave of E.M.F. The exciter is mounted on the extension of the alternator shaft. The stator frame is built in two halves, securely bolted by means of finished bolts. The frame is made of cast iron, and is designed to allow complete ventilation of the laminations and at the same time to secure rigidity of the frame. The coils are former-wound and are embedded in rectangular slots, being held in position by wooden wedges, and are easily and quickly replaced; they are protected outside the laminations by means of a cast-iron shield, cast in sections, bolted to the frame, and easily removable. This shield is of a perforated design, and does not in any way interfere with the ventilation.

The direct-current machines are designed to give an output of 300 kw. when running at 375 r.p.m. at a pressure of 500-550 volts. The generators are in every respect in accordance with the standard practice of Dick, Kerr, and Co., Limited. The magnet frame is of cast iron, the pole-pieces being built of laminated steel and cast into the magnet frame. The commutation is sparkless at all loads, and the field windings are so arranged as to give a 10 per cent. rise in the E.M.F. from no load to full load.

The switchboard was built by Dick, Kerr, and Co., Limited, and consists of 20 marble panels, each supported independently on an iron frame. The board consists of three alternating-current generator panels, one alternating-current spare generator panel, one alternating-current total output panel, four alternating-current outgoing feeder panels, two direct-current generator feeder panels, one direct-current total output panel, one Board of Trade panel, one negative booster panel, six direct-current feeder panels.

The whole of the extra high-tension oil switches are contained in a special chamber beneath the main switchboard gallery, each switch being isolated in a separate cell, the front of which is closed by a sheet-iron door. The switches are operated from the main gallery by wooden rods and levers, and the panels on the gallery contain no instruments or switches carrying current at high pressure.

(*To be continued.*)

PRIME MOVERS AND AUXILIARY PLANT AT OLYMPIA.

BY E G BEAUMONT, A.M.I.C.E.

(*Continued from page 481.*)

The external appearance of one of the 12-b.h.p. high-speed Wade and Jones oil-engines may be gathered from the photo reproduction (Fig. 6). It is there shown coupled to a two-pole 7-kw. Parker dynamo having an output of 50 amperes at 140 volts. A simple form of universal coupling is used between the engine and dynamo, which gives some freedom of movement in all directions without necessitating the use of a flexible coupling. The cylinders are opposed, and the connecting rods work on to a single-throw balanced crankshaft having one long crank-pin. One connecting rod has a big end bearing the full length of the crank-pin, and the second rod is forked and takes a bearing at each side of the first rod and over its bearing sleeve. With this arrangement of cylinders and with a single-throw crankshaft two useful working strokes in succession are followed by two idle strokes. With a two-cylinder engine of this type an almost perfect balance of the reciprocating and rotating parts may be obtained if a two-throw crankshaft is used with the crank-pins opposite each other or at 180deg. Greater regularity of turning effort may also be in this way obtained, the working and idle strokes occurring alternately. The cam shaft inside

Digitized by Google

the closed chamber at one side of the engine is hollow, and there are fixed upon it the exhaust-valve cams, a centrifugal governor, and the eccentric which drives the valveless pump

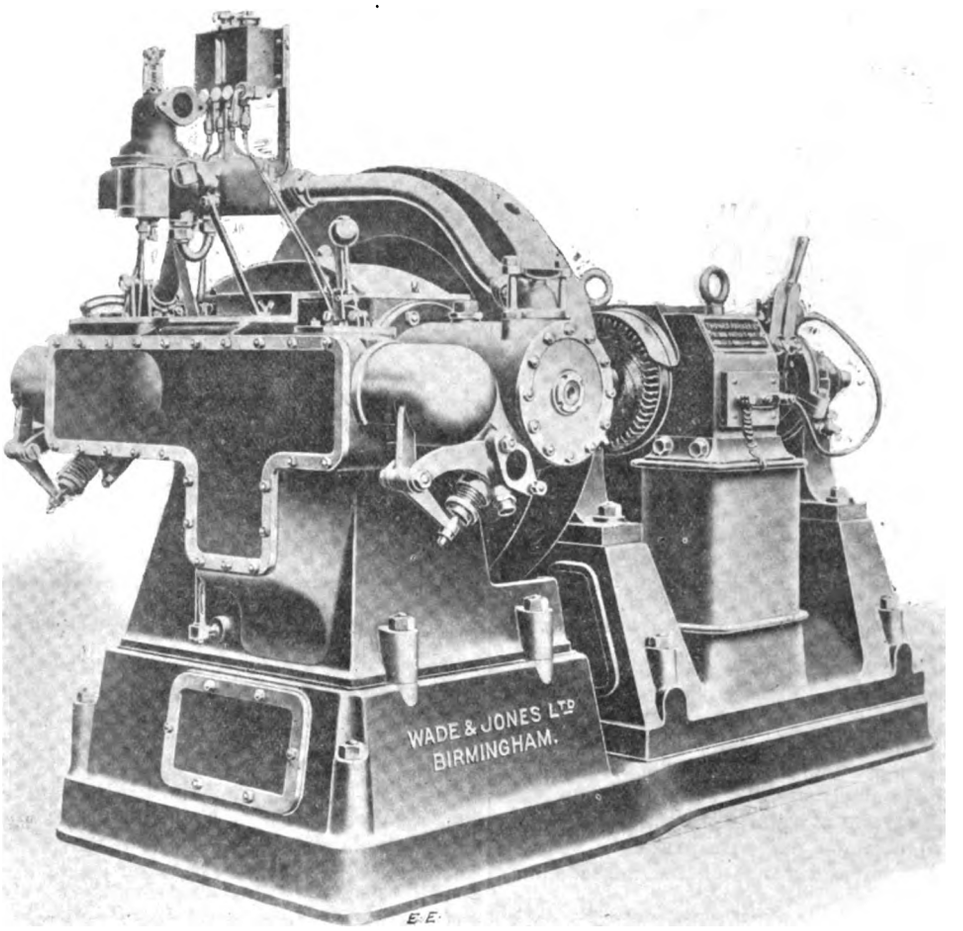

FIG. 6.—View of a 12-b.h.p. Wade and Jones Oil Engine.

for the forced lubrication system. Compression relief cams, with projections which may be caused to overlap the exhaust-valve cams when they are moved into position by a rod

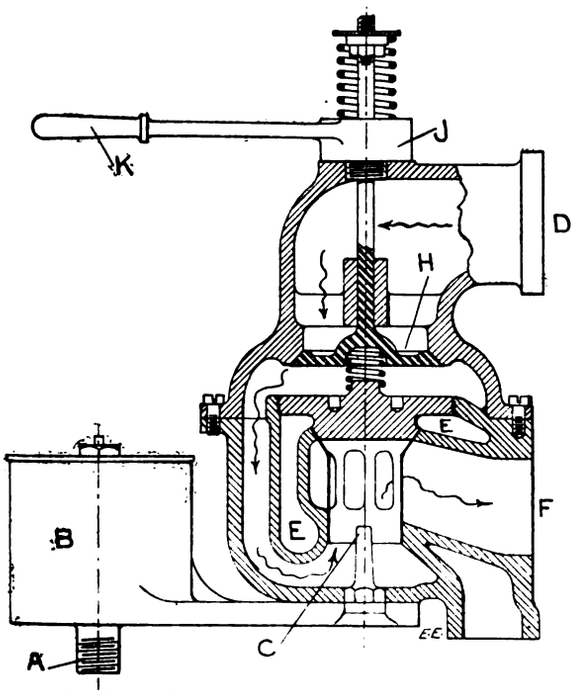

FIG. 7.—The Carburettor of the Wade and Jones Engine.

sliding within the hollow cam shaft, facilitate starting the engine. Movement is given to this rod, and so to the sliding cams, by a forked lever, the ball-ended top of which may be seen towards the right-hand end of the cam-shaft casing. The exhaust-valve boxes are arranged diagonally below the cylinders, and, with the bell-crank valve operating levers, may be seen in Fig. 6. These valve boxes are readily removable complete with the valves and operating levers, and are separately water-jacketed in order to avoid difficulties with water joints at the cylinder facings. The valve stems are cooled, and the possibility of sluggish working of the valves is reduced. The inlet valves at the top of the cylinders are accessible for examination, and are connected by lagged pipes, one of which is visible, with the vaporiser extension of the carburettor.

The sectional view of the paraffin carburettor (Fig. 7) differs in small details from that shown in Fig. 6, but it correctly shows the internal arrangement. Through a two-way cock petrol or paraffin fuel is supplied at A to the constant level float chamber, B, and thence to the large-bore spraying nipple, C, and at about the level of the top of the jet piece. The air inlet is at D, and the course taken by the air is indicated by arrows. The flow of air by suction from the engine around and past the nipple C induces a flow of petrol or paraffin in the form of a spray. The air, heated during its passage through the carburettor by contact with the hot outer and inner walls of the exhaust gas jacket or chamber, E, readily absorbs or takes up the sprayed fuel, partly by surface evaporation on the oil-wetted internal surfaces of the carburettor, and carburation of the air is also assisted by the continued rush of the mixture through the hot exhaust jacketed throttle valve and vaporiser chamber connected at F. The induction pipes between the vaporiser and the inlet valves are, as already stated, lagged to prevent chilling of the mixture and condensation of what is, without doubt, not so much a vapour or gas as an air oil mist. By reference to Fig. 7 it will be seen that the air on its way to the carburettor mixing chamber has to open, and pass through, the spring-closed valve, H. The designers attach considerable importance to the adjustment of the spring pressure on this valve, but this is a maker's adjustment, and the use of the internally threaded collar, J,

Digitized by Google

with the handle, K, is only intended to be a further means of slight variation of the spring pressure to suit extreme conditions of atmosphere or temperature. Petrol is first supplied to the carburettor, and the engine may be started and got under way with no heating of the vaporiser or the delay caused by the preliminary heating required with the usual types of stationary oil-engines. The change from petrol to paraffin may be made as soon as the engine has

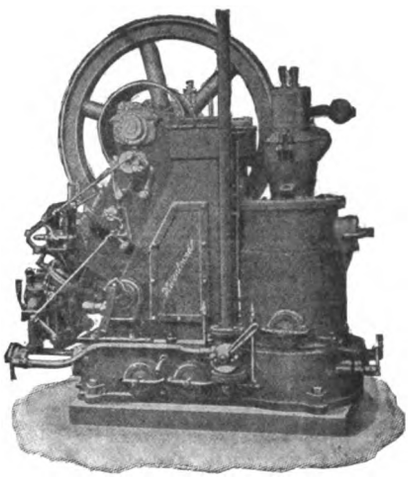

FIG. 8.—The Hillenbrand 5-b.h.p. Suction Producer Plant and Engine.

warmed up its carburettor and vaporiser chambers, and while it is running on load.

These engines are not made in larger powers at present than 25 h.p., but for small electric light installation work, and for the many purposes where auxiliary plant is required, they should prove extremely useful. It has already been mentioned that the system of electrical ignition employed is precisely that in common use with many automobile petrol engines, and involves the use of accumulators and induction coils with sparking plugs in the cylinder heads. As this is the only system of ignition fitted to the engines, it may be assumed that the problem of running a stationary oil-engine with paraffin fuel and with automatic fuel supply through a carburettor has been successfully dealt with, for if combustion is imperfect, and the engine becomes dirty internally, ignition by the use of sparking plugs would be impracticable.

Of the three engines exhibited by Messrs. A. P. Wright and Co., two are shown coupled to continuous-current dynamos, and the third to a Sturtevant ventilating or drying fan to deal with 12,000 cubic feet of air per minute against a water-gauge resistance of 1·5in. The cylinders of these engines are 6·5in. diameter, the stroke is 7in., and the normal speed is 700 r.p.m. Other interesting details not here referred to, such as the completeness of the lubricating system, and the nature of the construction and workmanship, may be judged by examination of the engines at Olympia.

The small Hillenbrand suction gas-engine exhibited by Messrs. G. Braulik on Stand No. 209 may now be included among the few working exhibits. From Fig. 8 some idea of the appearance of the complete producer plant and

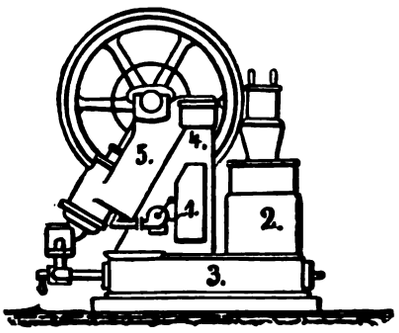

FIG. 9.—Outline Diagram of Hillenbrand Engine.

engine may be gained, and some description of its working may be given with reference to the outline diagram (Fig. 9). Although the engine may under some circumstances be direct coupled to the dynamo or other machinery to be driven, it is shown at the exhibition belted to a Silvertown continuous-current dynamo having an output of 12·5 amperes at 220 volts. An interesting feature is the utilisation of some of the waste heat in the exhaust gases and of the heat absorbed in the cylinder jacket to warm the air in its passage to the producer, and to warm the air entering the cylinder with the gas to form the explosive mixture. The air warmed during its passage through the cylinder jacket passes over the surface of the cooling water, and the vapour thus formed is further heated during its passage through the exhaust silencer contained in the bed, 3, of the engine (Fig. 9). The heated vapour then passes up through the producer grate and through the incandescent fuel for the formation of producer gas from the anthracite fuel in the usual manner. The gas leaves the producer, 2,

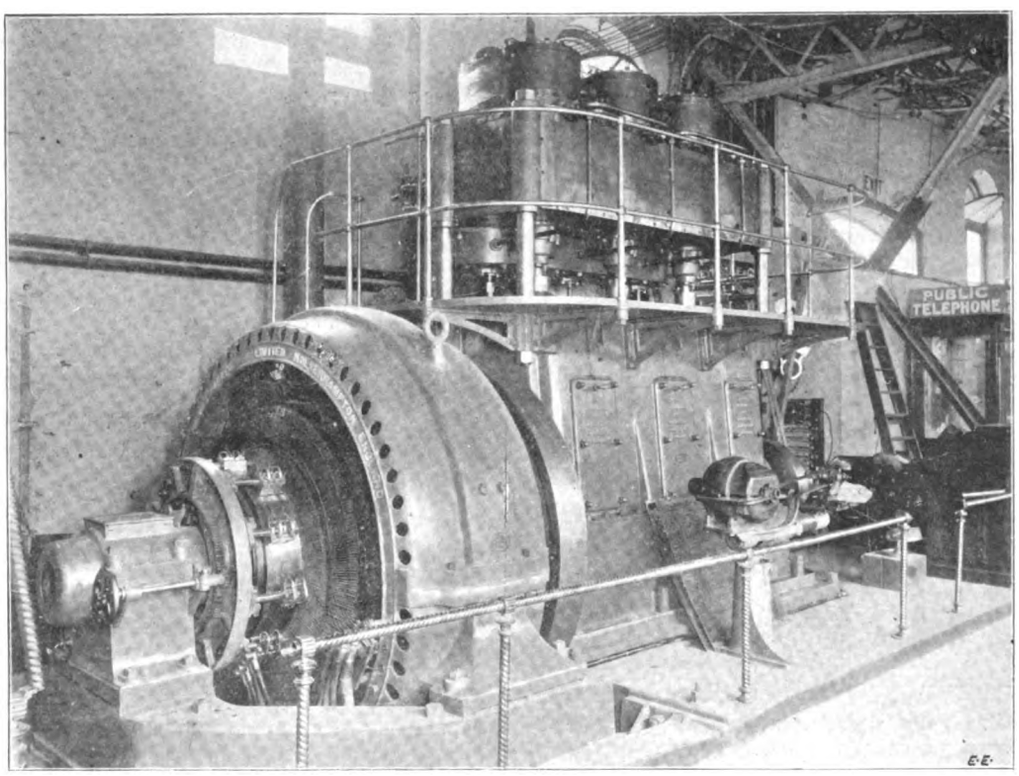

FIG. 10.—A Peache-Parker Generator at Olympia.

Digitized by Google

and then follows an upward and downward course through the scrubber contained in the chamber, 4, and thence to an expansion chamber in the engine bed. The mixture of gas and air is controlled by a mixing cock before entry to the inlet valve box, the air required for combustion in the cylinder being previously heated to a higher temperature than that of the gas with which it is mixed by its flow around the crankshaft bearings, and through a system of pipes in the cylinder cooling water. It is claimed that by this attention to regulation of temperature no deposition of tarry matter occurs on the engine valves or in the cylinder, and the appearance of the valves when examined at the exhibition after a stated run equivalent to several months' continuous working seems to confirm this claim. Without doubt economy may be expected to result both of fuel and of water from the peculiar heat interchanges obtained in this design of engine. The engine illustrated develops 5 b.h.p., and the floor space occupied is only 6ft. by 3ft. It is, therefore, a very compact design, but it is obviously not of a type intended to be made in large sizes. The engine, working on the Otto cycle, is arranged diagonally on the cast frame with the valves set vertically in their boxes at the base of the cylinder, and low-tension magneto ignition is employed. The illustration here given (Fig. 8) necessarily does not show features of design and construction, which can only be appreciated by inspection of the engine at the exhibition.

Fig. 10 shows the Peache single-acting high-speed steam-engine and 10-pole continuous-current generator conjointly exhibited by Messrs. Davey, Paxman, and Co., Limited, and Messrs. Thomas Parker. As already stated, this set is supplying power and light for the purposes of the exhibition, supplied with steam from the marine-type Babcock and Wilcox water-tube boiler to be seen in the exhibition yard. The design of the engine is now well known and proved, and, as may be seen from Fig. 10, is of the three-crank, six-cylinder, tandem, compound type, with the piston valves at the back of the cylinders operated by an interesting form of valve gear, which takes up no room lengthways and permits the use of long and ample crankshaft journals and bearings. The high and low pressure cylinder diameters are respectively 11in. and 22in., with a stroke of 12in., and at a speed of 325 r.p.m. the engine is capable of developing 440 h.p. to 500 h.p. The rated dynamo output is 1,150 amperes at 250 volts. The engine and dynamo were erected at Olympia and there run for the first time, and by continuous running since the opening of the exhibition constitutes the only working example of a modern steam-driven central-station generating set.

The frequent and continued use of superheaters of various types for the supply of superheated steam to modern steam-engines has done much to disprove the adverse criticism made by many a few years ago, to the effect that the unsatisfactory experience obtained many years ago would be repeated. The early failure to use superheated steam has not been repeated, and the success achieved as regards the durability or useful life of the exposed parts of the superheaters is to be largely attributed to the good use made of the excellent steels now available. Messrs. McPhail and Simpson's exhibit of superheaters and parts should be seen by those interested in the use of superheated steam, and in improving the economy of their steam plant. The tubes shown on their stand, which have been in service for nine years in a superheater connected with a Babcock and Wilcox boiler, should particularly be examined. The temperature of the steam in these tubes is stated to have been 700deg. F., but there is little evidence of deterioration other than the comparatively slight pitting or irregular wasting of the external surface. In any case the use of these tubes under high temperature and over a period of nine years demonstrates that the life of superheater tubes may be greater than that of the tubes used in a multi-tubular steam-boiler, and removes any uncertainty there may have been as to their durability.

No further reference has been made to the Diesel oil-engine, but at a future date some particulars may be given. It may, however, be said that in essential details there is little change from the 20-h.p. horizontal engine which many readers will remember was shown at the Glasgow Exhibition in 1901. Such changes as have been made are mainly those affecting constructional detail and the rearrangement of parts in the vertical type of engine.

The small internal-combustion motors will not now be described, for they have many features common to the types already illustrated. They are, however, instructive examples of the reduction of weight, space occupied, and first cost made possible with high speeds of rotation. A typical exhibit is the 18-h.p. to 24-h.p. Blake petrol engine, coupled to a Siemens four-pole 7-kw. dynamo, shown on the Electrical Power Storage Company's stand (No. 98), and introduced by the Windsor Electrical Installation Company. The over-all dimensions of this set are 5ft. 4in. by 2ft. 3in. by 3ft. 9in. high. With the decreased difference of cost of paraffin and petrol, the use of the rather more expensive fuel may be of little importance with these small engines for country house lighting.

There are other exhibits of purely auxiliary plant to be seen, and amongst these may be mentioned the collection of pumps of various types, some of them electrically driven, shown by Messrs. Frank Pearn on Stand No. 211, and electrically-driven air-compressors, among other machinery, on Messrs. George Richard and Co.'s stand (No. 68).

A final reference may be made to the exhibit in the Loan Section of the portable generating plant used by the Electrical Engineers (R.E.) Volunteers to such good purpose during the South African war. The completeness of the design of this petrol-electrical combination must be seen, and seen by engineers, to be appreciated.

CALCULATION OF ALTERNATE-CURRENT TRANSFORMERS FOR MINIMUM COST.

BY DR. R. POHL AND H. BOHLE, BRADFORD.

(*Concluded from page 449.*)

We may now proceed in two ways to obtain the maximum possible, $S \times B$, and the corresponding values of d, d_1, and h

(a) We substitute the value of d_1 in equation (17) and find

$$S\,B = \frac{\beta}{2\,\frac{\gamma}{a}\,d^4} - \frac{a}{4\,\frac{\gamma^2}{a^2}\,d^6 - 4\,\frac{\gamma}{a}\,d^5}$$

Differentiating, we obtain

$$\frac{\delta\,S\,B}{\delta\,d} = -\frac{4\,\beta}{2\,\frac{\gamma}{a}\,d^5} + \frac{24\,\frac{\gamma^2}{a}\,d^5 - 20\,\gamma\,d^4}{\left(4\,\frac{\gamma^2}{a^2}\,d^6 - 4\,\frac{\gamma}{a}\,d^5\right)^2}$$

By simplifying, arranging, and placing the differential coefficient equal to zero, we find

$$8\,\beta\,\frac{\gamma}{a}\,d^2\left(\frac{\gamma}{a}\,d - 2\right) + (8\,\beta - 6\,\gamma)\,d + 5\,a = 0 \qquad (19)$$

This is an equation of the third degree and may easily be solved graphically. It is even possible to solve it directly, but the proceedings are less simple. By means of equations (16), (17), (18), (12), (13), (2), and (4), we find d_1, S B, h, G_c, G_i, S, and B respectively.

(b) We assume several values of d and calculate—after having found d_1, by means of equation (16)—the corresponding values of S B. The latter we plot now as function of d, and we obtain in this way a curve (see Fig. 9) from which the maximum possible value of S B and the corresponding value of d may be taken. The subsequent calculation is the same as under (a).

It will be found that the method depicted under (b) is the simpler one of the two. From the curve we see that two values of d correspond to every value of S B. In other words, we may build two transformers—the one short and thick, and the other long and thin, but which have the same efficiency, distribution of the losses, densities, and weights.

After having settled the principal dimensions of the transformer, the calculation of the flux, the number of primary and secondary turns, the radiating surface, the no-load current, and the drop is a simple matter. If it is found that the radiating surface is insufficient, we must

Digitized by Google

either increase the efficiency or employ a suitable method for cooling the transformer.

For a series of standard designs we may simplify the calculation considerably. The frequencies usually employed are 50, 40, and 25. For a standard shape of core cross-section, the space factor, f_i, will be nearly constant. For constant primary and secondary pressures, f_c will increase

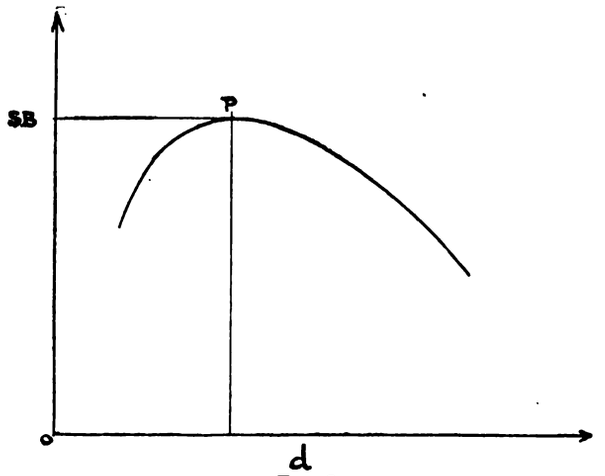

FIG. 9.

slightly with increasing output, but this increase is only small, so that no great error is made if f_c is assumed to be constant. Let, for instance, $f_i = \cdot 67$ and $f_c = \cdot 35$, then α may be plotted as function of the output. This has been done in Fig. 10 for frequencies of 50, 40, and 25. Similarly, we may plot the quantities β and γ as functions of the total loss, W_v, if we assume that $\sqrt{K_2}$ is constant. The error thus introduced will be very small, as may be seen for Curve II. of Fig. 6. For Figs. 11 and 12, $p_c = p_i = \cdot 5$. $K_1 = 2 \cdot 6$; $K_2 = 4 \cdot 15 \times 10^{-8}$, and $K_3 = \frac{S_c}{S_i} = 3$.

The course of the calculation is now as follows: In the

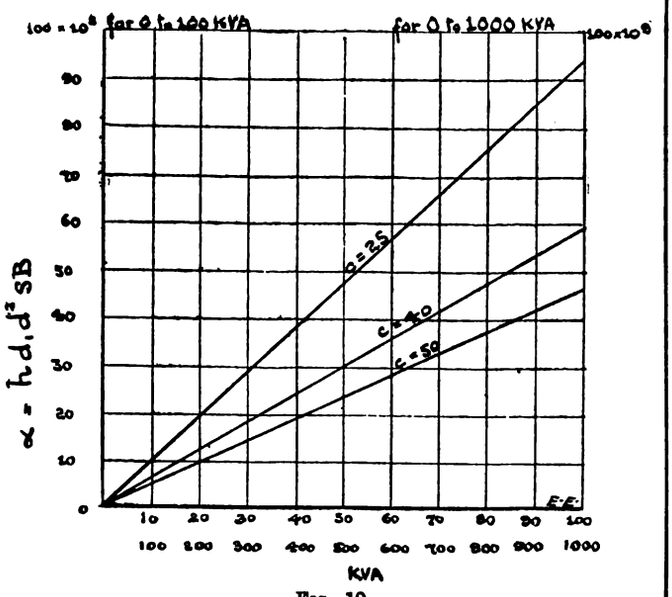

FIG. 10.

first place, we determine the conditions under which the transformer has to work. Next, we distribute the losses, decide upon the space factors, f_i and f_c, and calculate by means of the equations (9), (14), and (15) the quantities α β, and γ. When this has been done, we assume various values of d, and calculate the corresponding values of S B, which are then plotted as functions of d. In this way we obtain a curve from which the peak values of d and S B may be taken. Equations (16), (18), (12), (13), (2), and (4) determine, then, d_1, h, G_c, G_i, S and B respectively. An example will further illustrate the method.

A transformer of 50 kilovolt-ampere capacity has to be designed for a full-load efficiency of 97·5 per cent. The transformer is to be used for power purposes only, and is consequently nearly always fully loaded. The frequency of the network is 50 periods per second. The cost of the transformer must be a minimum. The price per kilogramme of copper is thrice that per kilogramme of iron, so that $\frac{S_c}{S_i} = K_3 = 3$. We distribute the losses, $W_v = 1{,}250$, evenly, so that $p_c = p_i = \cdot 5$, and $W_c = W_i = 625$. For a mean temperature rise of 40deg. C. and a supplementary loss of 15 per cent., the constant $K_1 = 2 \cdot 6$. Let, further, the space

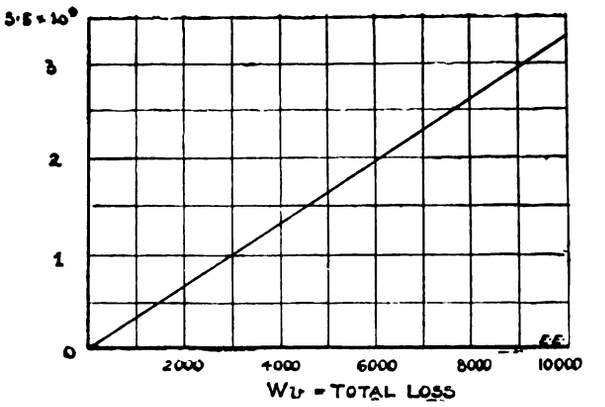

FIG. 11.

factors, f_i and f_c, be equal to ·67 and ·35 respectively, and $K_2 = 4 \cdot 15 \times 10^{-8}$. We have now

$$\alpha = \frac{5 \cdot 7 \times 10^8 \times \text{K V.A.}}{C \times f_i \times f_c} = \frac{5 \cdot 7 \times 10^8 \times 50}{50 \times \cdot 67 \times \cdot 35} = 24 \cdot 25 \times 10^8.$$

(See also Fig. 10.)

In a similar manner we find β and γ.

$$\beta = \frac{K_3 W_v}{\cdot 012 \times f_i} \times \sqrt{\frac{p_c \times p_i}{K_1 K_2 K_3}} = \frac{3 \times 1{,}250}{\cdot 012 \times \cdot 67} \times \sqrt{\frac{\cdot 25 \times 10^8}{2 \cdot 6 \times 4 \cdot 15 \times 3}} = 4 \cdot 1 \times 10^8;$$

and

$$\gamma = \frac{W_v}{\cdot 028 \times f_c} \times \sqrt{\frac{p_c \times p_i}{K_1 K_2 K_3}} = \frac{1{,}250}{\cdot 028 \times \cdot 35} \times \sqrt{\frac{\cdot 25 \times 10^8}{2 \cdot 6 \times 4 \cdot 15 \times 3}} = 1 \cdot 12 \times 10^8.$$

(See Figs. 11 and 12.)

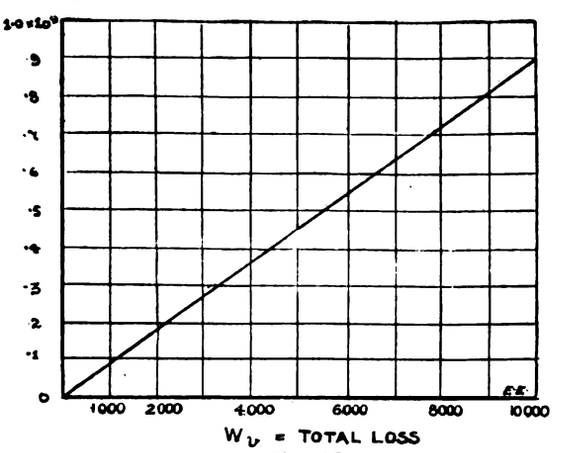

FIG. 12.

Next we assume various values of d, and determine the corresponding ones of d_1 and S B.

Let $d = 25$,	then $d_1 =$	7 5,	and S B =	2,380.
26	,,	10 4	,,	4,150.
27	,,	13	,,	4,500.
28	,,	16·2	,,	4,500.
29	,,	19·2	,,	4,300.
30	,,	22 8	,,	4,000.

In Fig. 13 the values of S B have been plotted as functions of d (see Curve I. of Fig. 13). The most economical values for d and S B are 27·5 cm. and 4,600 respectively, denoted by the peak, P, of Curve I. They form now the basis of the subsequent calculation. We find

Digitized by Google

$$d_1 = 2d\left(\frac{\gamma}{a}d - 1\right) = 2 \times 27{\cdot}5\left(\frac{1{\cdot}12 \times 10^8}{24{\cdot}25 \times 10^8} \times 27{\cdot}5 - 1\right)$$
$$= 14{\cdot}6 \text{ cm.}$$

$$h = \frac{a}{S\,B\,d_1\,d^2} = \frac{24{\cdot}25 \times 10^8}{4{,}600 \times 14{\cdot}6 \times 27{\cdot}5^2} = 48 \text{ cm.}$$

$$G_c = \frac{W_v}{S\,B} \times \sqrt{\frac{p_c \times p_i}{K_1\,K_2\,K_3}} = 238 \text{ kg.}$$

$$G_i = 3 \times 238 = 714 \text{ kg.}$$

$$S = \sqrt{\frac{W_c}{K_1\,G_c}} = \sqrt{\frac{625}{2{\cdot}6 \times 238}} = 1.$$

$$B = \frac{S\,B}{S} = \frac{4{,}600}{1} = 4{,}600.$$

In this way we have settled all the main dimensions of the transformer. In order to find the primary and

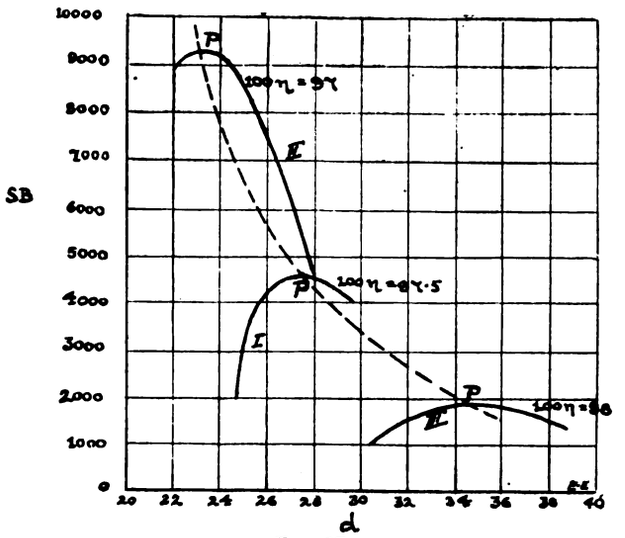

FIG. 13.

secondary turns, we must know the primary and secondary pressures. As, however, the subsequent calculation contains no new features, it will be left to the reader. He will then find that the radiating surface will be large enough for natural air cooling, and that the drop is also extremely small.

In order to show the relationship between the efficiency and the cost of the active material, the transformer has also

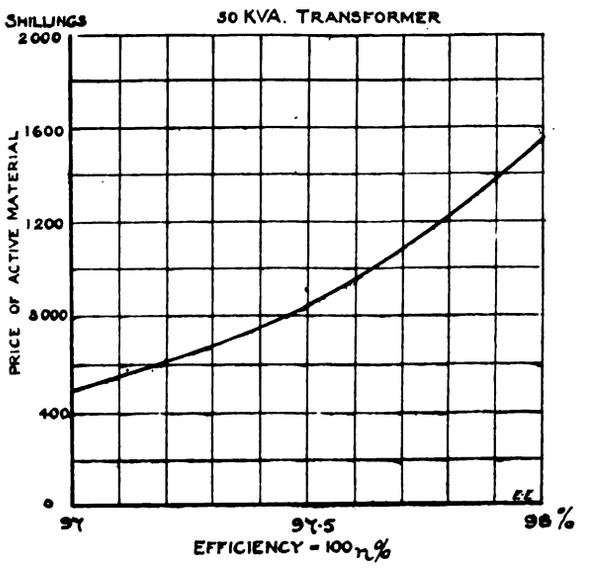

FIG. 14.

been calculated for efficiencies of 97 and 98 per cent. By connecting all the points, P—*i.e.*, the peaks of the three curves (see Fig. 13)—we obtain a fourth curve, which represents the weights—consequently, also the price—of the active material. The curve is shown separately in Fig. 14, in which the price of the active material has been plotted as function of the efficiency. We have reckoned here 21d. per kilogramme of insulated copper, and 7d. per kilogramme of stamped iron plates. We see that the price of the same transformer (active material) for an efficiency of 98 per cent. is nearly 3½ times higher than for an efficiency of 97 per cent. In the latter case, effective artificial cooling would be necessary.

By using our method of calculating transformers, it will be found that in many cases the cost of a transformer will be reduced by a not inconsiderable amount, and the time spent on the calculation is also greatly decreased. For three-phase core and single-phase shell transformers, a slight modification of one or two formulæ will be required, but which should offer no difficulties.

ELECTRICITY METERS.

The series of lectures at the Olympia Exhibition are attracting large audiences, and there was a substantial attendance again on Tuesday evening, when Mr. S. Z. de Ferranti delivered a popular address upon "Electricity Meters." Having described the mechanical principles of the gas-meter, he traced the evolution of the meter designed by himself, stating that 23 years ago he was favourably impressed by electro-chemical methods. He soon discovered, however, the superior qualities of the motor meter, which he believed would be the instrument of the future. He also discussed the depositing meter devised by Edison 25 years ago, and the instruments of Kelvin, Ayrton and Perry, John Hopkinson, and Aron, down to the Fricker prepayment meter. The audience seemed highly interested, though how far they understood the subject is problematical. If their knowledge was on a par with that of the average layman, the result was creditable to Mr. Ferranti's abilities as a lecturer.

MILAN INTERNATIONAL EXHIBITION, 1906.

We have been requested by Mr. Arthur Serena, hon. executive commissioner for Great Britain at the Milan Exhibition of 1906, to state that H.M. the King of Italy will offer prizes to the extent of £1,600 to exhibitors. This amount will be divided as follows: (1) a prize of £200 for automatic safety couplings for railway rolling-stock; (2) a prize of £200 for the best method of testing high-voltage electric currents without danger to the operator; (3) a prize of £400 for the best and most original exhibit of machinery or manufacturing process; (4) a prize of £200 for the best established method of distributing healthy and pure milk in centres of population: (5) a prize of £400 for the best type of popular dwelling adapted to the climate of Northern Italy; (6) a prize of £200 for motor boats.

In addition to the foregoing there will be given a national prize of £200 to the public institution or private society which, during the last 10 years, has been most successful in the work of reclaiming waste lands in mountainous districts, and in the improvements of pasturage. These special inducements to exhibiting will doubtless possess attraction for British manufacturers, inventors, and others, who should without loss of time address themselves for further particulars to the Hon. Executive Commissioner of the British Section, 1 and 2, Oxford-court, Cannon-street, London, E.C.

FORTHCOMING EVENTS.

SATURDAY, OCT. 14.

Birmingham Electric Club.—At 7.30 p.m., general meeting.

WEDNESDAY, OCT. 18.

Junior Institution of Engineers.—At 4 p.m., visit to the Olympia Exhibition.

THURSDAY, OCT. 19.

Rugby Engineering Society.—At 8 p.m., "Electric Switchgear," by Mr. J. Whitcher.

FRIDAY, OCT. 20.

Institution of Mechanical Engineers.—At 8 p.m., "The Manufacture of Cartridge Cases for Quick-Firing Guns," by Colonel Leandro Cubillo.

Electro-Harmonic Society.—At 8 p.m., first smoking concert of the season in the King's Hall, Holborn Restaurant.

Tramways and Light Railways Association.—Oct. 25, at 8 p.m., "Roller Bearings," by Mr. T. W. How.

Institution of Civil Engineers.—Nov. 7, at 8 p.m., inaugural address by Sir Alexander Binnie and presentation of awards.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

ITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-year's copies, bound in Dark-Blue Cloth, Gold-Lettered, price 8s. 6d. New Volume, January to June, 1905, now ready.*

HISTORIC.

It is just as well to be reminded occasionally of the history of electrical developments. The latter half of the nineteenth century has much to answer for in this direction, yet many of those actively engaged in electrical enterprises do not really understand that the whole development is within the recollection of many an old man. Eighty years ago, and where was telegraphy? And old men of eighty are met with daily. Electro-deposition, again, is within that period, as is electric lighting and power transmission, while wireless telegraphy is still more recent, and within the memory of almost every schoolboy. Mr. Esson in his presidential address to the Civil and Mechanical Engineers selected, as was natural, for his text, "The Influence of Electricity on Power Engineering." In a way, electrical development can never have quite the same far-reaching effect as did the development of steam, but none of us can imagine the magnitude of change of the revolutionary epoch inaugurated really only some twenty-five years ago. The development of steam brought the ends of the world more closely together than were towns at the extremities of this island a hundred years ago. People who dogmatise about food supply and certain economic fictions have not yet learned that the latter are fictions, just because the cornfields of Manitoba and the grazing lands of New Zealand are nearer to the great centres of population in Europe than even the glens of the Highlands at the end of the eighteenth century. The ease of intercommunication has considerably altered the prevailing conditions of living, and if due consideration is not given to the results following the development of steam, the conclusions arrived at will be incorrect. The evolution of electrical engineering has been more rapid than in the case of steam, and the results obtained, added to the invisibility of the agent used, have so acted upon the imaginations of the masses that a glamour is thrown around the subject similar to that which exists in the minds of the younger generation when reading the wonderful feats recounted in the "Thousand and One Nights." Electricity (the unknown), utilised by apparatus devised by capable men, seems to give opportunities in every direction, and no one is surprised at the next suggestion for its use. Tentative attempts at electric lighting have been made since the later thirties, but, of course, the apparatus then at command—batteries, crude arcs, and still cruder incandescents—was not effective. The early fifties saw a result that Mr. Esson might just have referred to, though it hardly, perhaps, comes within the scope of his discourse. We refer to the work of Wilde and what arose out of it. Except, however, for a little lighthouse work, electric lighting really slept till the advent of Gramme and Jablochkoff. The French Exhibition of 1878 led the way, and opened the eyes of the world more than anything that had gone before to the possibilities of electrical work. Between 1878 and 1881 the strides were rapid, and the exhibition at Paris in the latter year revealed fully to an astonished world the dawn of the electrical era. Prior to that electrical engineering was not. Since then it has been, and has overshadowed all other branches of engineering, till in one direction alone—the harnessing of water power previously running to waste—the work has become gigantic. Here is what Mr. Esson says on this point: "Up to the present I have referred to hydro-electric plants only, and it is not easy to estimate the total of the water power which has been utilised all over the world by their erection. The tribute under which Niagara River has been laid for power supply has been already cited, and I believe I am well within the mark in placing the total

Digitized by Google

capacity of the hydro-electric power-houses at work and under construction on the American continent alone at a million horse-power. In Italy, Lombardy alone accounts for 88,000 h.p. in hydro-electric power-houses at work and under construction, while Switzerland, the home of hydro-electrics, accounts for 220,000 h.p. Taking the whole world, the water power utilised in the hydro-electric stations must lie somewhere between a million and a half and two millions of horse-power—a vast force the greater part of which might have run to waste for all time had it not been for the invention of the dynamo." We do not know if the ordinary reader sees in development of this kind a total change of certain conditions previously existing; hence the certainty of further change of population and of manufactures. The moral is clear enough to those not blinded by political or other antipathies that great changes are going on, and must be faced. Take one direction—a million horse-power used. Unless the demand for horse-power increases in proportion to the supply, there must be a less demand for factors previously making the horse-power. Work will be shifted from one place to another, with the consequent troubles arising out of such shifting.

THE DYNAMICABLES.

It is understood that ordinarily the social gatherings of this unique society are to go unreported. There are exceptions to every rule, and the gathering at the exhibition on Wednesday evening is one of the exceptions. The notice given was necessarily very short, and the Press was invited to assist in giving it a wide publicity. The result must have been gratifying to the president of the evening—Sir W. H. Preece—and to the hon secretary, Mr. Sharp. The latter deserves the best thanks of all Dynamicables for the excellent arrangements he makes on all occasions. Nearly a hundred members and friends sat down to dinner, most of whom had previously spent some time in "doing the exhibition." The toasts, as usual, were few, being confined to the loyal toasts and "Success to the Exhibition." We are all in our own ways trying to make it a success. Messrs. Lyons catered excellently.

CORRESPONDENCE.

THE ALL-STEEL RAILWAY CARRIAGE.

SIR,—Your correspondent "Experience" must be an old gentleman with a wonderful memory to recall so vividly the terrible discomforts of steel railway carriages 50 years ago. Of the hundreds of thousands of people who have travelled on Mr. Cuningham's steel cars on the Central London Railway during the past two years, not one has complained of being frostbitten in winter or parboiled in summer. In fact, I do not suppose they even knew that the cars were steel.

I must confess that until I read "Experience's" letter I did not know that the manufacture of steel was so far advanced 50 years ago that railway cars could be made of it.

No doubt the Brush Company would be very much obliged to "Experience" if he would produce some record of the steel cars of 50 years ago; but, failing that, the company is not likely to be turned from its course in pushing the sale of rolling-stock which both English and American practice of the present day shows to be in demand.—Yours, etc., T. C. E.

IMPERIAL NOTES.

DUNEDIN, NEW ZEALAND.

The city of Dunedin (the old name for Edinburgh) is in the province of Otago, in the South Island of New Zealand, and is 230 miles by rail south from Christchurch. The city was founded on March 23, 1848, constituted a Town Board on Aug. 27, 1855, and incorporated on Aug. 1, 1865. It has this year extended its area by taking in the adjoining boroughs of South Dunedin and Caversham, and has now a population of 38.121 (or with suburbs, 53,294), 91 miles of streets, and 8,715 buildings. Its rateable value is £360,846, and the general rates are 1s. 3d. in the £, special rates 9d. in the £, and water rate 1s. in the £, or 3s. in all.

Gasworks.—The gasworks are the property of the Corporation except in the added borough of Caversham, where this undertaking is in the hands of a private company. The price charged for gas for lighting purposes is 6s. 3d. per 1.000 cubic feet net, and for cooking purposes 5s. per 1,000 feet. There are over 4,000 gas consumers within the boundary of the old city, and 160 gas-engines. Gas was first lighted in Dunedin on March 9, 1863 On this undertaking the Corporation has borrowed £100,000.

Electric Tramways.—The tramway system is owned by the City Corporation, and the works of construction were commenced on Feb. 26, 1903. The total length of route is 14 miles 19 chains, and of this length 5 miles and 46 chains is double track. At the present time 15 miles and 57 chains of single track are being worked. On the city portion of the double track centre poles are used, and these are spaced at distances of from 120ft. to 130ft. apart. The gauge of the track is the standard 4ft. 8½in., and the sharpest curve has a radius of 52ft. 6in. The rails are of the grooved girder type, 6½in. in depth and 6½in. wide on the base, and weigh 94lb. per lineal yard. They are laid on Australian hardwood sleepers spaced 2ft. 6in. apart centre to centre. The surface of the track is made up with a layer of 1½in. tarred macadam and 1½in. tarred screenings, and finished with tar and sharp sand. The rails are protected by stone setts laid alternately longitudinally and transversely.

Power-House.—The power-house plant consists of three Westinghouse units, each 200 kw., direct-coupled to Belliss engines. Three boilers of the Babcock and Wilcox type are installed, but this installation is only of a temporary character until such time as the Waipori water-power scheme shall be completed. A storage buffer battery is used in conjunction with the power plant in order to carry the peaks to the load. The system is not yet quite complete, as several of the streets are to be widened before the tracks can be laid down. Portions of the system, however, have been running for some considerable time, and up to May 3 the number of passengers carried was 9,999,907, the revenue earned was £44,980. 18s. 5d., and the number of car miles run was 812,373. This gives a revenue return of 13·28d. per car mile.

Car-Sheds.—These are of the most modern type, provided with all necessary workshops, stores, etc., and all mechanical appliances for making the requisite repairs to the rolling-stock. The car-sheds are situated near to the centre of the system.

Rolling-Stock.—The rolling-stock consists of 50 cars, and includes 14 of the closed type (18ft. body with vestibule ends), 14 combination type (14ft. body and open compartments at each end), 15 10-bench open cars, six trailers, and one watering car. All cars are single-deckers with single trucks having a wheel base of 6ft. 6in. The motor equipments are of the Westinghouse type No. 80, with No. 210 controllers. All cars are fitted with Westinghouse magnetic brakes, which are used for all service stops.

Waipori Power Transmission Scheme.—The City Council has undertaken the installation of an electric power transmission plant at the Waipori Falls, which are situated about 35 miles from Dunedin. At these falls there is a head of water of 670ft., from which it is estimated that 5,000 h.p. will be obtained. It is proposed to shut down the steam plant and provide power for the tramways, street-lighting, and for light and motive purposes to private consumers. The first plant, which is now being installed, consists of two 1,000-kw. units direct coupled to Pelton wheels, and the power will be transmitted at a pressure of 35,000 volts (three-phase). It is anticipated that this power will be available in Dunedin by April of next year. Arc lamps are fixed on some of the central trolley poles, and it is intended to complete the lighting of several of the principal streets in this manner.

SOME NEW DESIGNS IN ELECTRIC LIGHT FITTINGS AT OLYMPIA.

[BY OUR SPECIAL ARTIST.]

(Continued from page 478.)

At the stands of the Edison and Swan United Electric Light Company, Limited, are to be seen some extremely tastefnl fittings; but owing to the amount of space taken up by their other exhibits, customers would do well to visit the showrooms in Queen-street, E.C. The special exhibition edition of their catalogue, Section VI, bound in a cover of marble and gold, is also well worth possessing for those who wish to make a selection of fittings. A few designs are illustrated herewith. Fig. 1 shows a very refined hall lantern in oxidised silver. The dome and hand-beaten straps form a pretty combination, and the satin-finished glass gives a subdued effect to the light. A neat two-light rise and fall pendant for bedrooms is shown in Fig. 2, the metal work being of polished brass, and the shades of a type known as obscured threaded Irene. The price of this fitting is very moderate.

Nothing could be more chaste and simple than the crown fitting shown in Fig. 3. This is of polished brass with chain and 5in. back-plate, and having a spread of 18in. The three amber-tinted shades give a tone which suits the fitting particularly to smoke-rooms and studies. Fig. 4 illustrates a new electrolier with nine lights, suitable for board-rooms, restaurants, etc. This is finished in polished brass, and provided with opal and green striped flint shade. The graceful curves of the arms will be specially noted. A dining-room pendant in oxidised silver and three similar flint shades is shown in Fig. 5. There are three lights under the shade, and the top lights can be omitted if necessary. Fig. 6 shows a handsome "Georgian" bracket in polished brass, also with a flint shade, as above; whilst Fig. 7 is a graceful design of Adams brackets for two lights, with "Hunterlite" candles. The length of this is 19in. and the spread 12in. Figs. 8 and 9 show two plain and inexpensive table standards. The former, for office use, is of polished brass, with green opal shade and cardboard curtain shade for screening the light from the eyes. This fitting can also be supplied in copper bronze for a slight extra. The standard shown in Fig. 9 is of Florentine bronze, and stands 12in. high. As a simple desk fitting for study or boudoir it cannot be excelled.

FIG. 8.

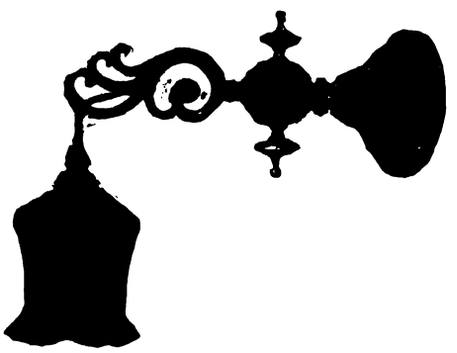

FIG. 6.

FIG. 9.

Amongst certain useful accessories in connection with fittings at Olympia there are the patent illuminating table cloth and connection shown at the stand of N. Burt and Co., and noticed by us in a recent issue; also a novel candle lamp made by Pope's Electric Lamp Company, for which special advantages are claimed. The General Electric Company, Limited, also have a new patent chain for suspending their electroliers, which is of great mechanical strength and as simple in design as the ordinary oval link chain.

DOMESTIC ELECTRIC LIGHTING.

BY JAMES SWINBURNE, M I E E.

On Friday, Oct. 6, Mr. James Swinburne delivered an interesting lecture at the Electrical Exhibition, Olympia, on the "Lighting of Houses by Electricity," of which the following is a *résumé*. The lecturer mainly confined himself to a description of the various types of electric lamp and the advantages of the use of electric light in comparison with other methods of illumination.

After mentioning the early work of Sawyer and Mann, Edison, Maxim, and Swan, the lecturer pointed out that the carbon incandescent lamp is to-day practically identical with the lamp suggested in 1836 and successfully made in 1880. The improvements made in these lamps are really improvements in detail of manufacture and standardising, which have fortunately rendered lamps much cheaper. Important improvements have been made in the method of blowing the bulbs of the lamps. In the early days bulbs were blown by hand; since then, however, the Germans have invented a method of blowing lamps by machinery, in a manner practically identical with that used in making bottles. The exhaustion of the lamps is now generally performed by the aid of a mechanical pump, although the vacuum obtained in this manner is not so good as that found in the earlier lamps. The method of "flashing" filaments invented by Maxim, but generally ascribed to Sawyer, has rendered it possible to obtain lamps which are practically uniform.

Before proceeding to describe the more modern form of electric incandescent lamps, Mr. Swinburne gave an interesting discussion on the relative cheapness of electric light and gas light. In the early days, when the luminous gas flame was used, electricity supplied at the cost of 3d. per unit would have been about equal to gas supplied at 2s. per 1,000 cubic feet. This estimate ignores the cost of lamps. At the present day the use of mantles has very much cheapened the cost of gas light. Gas companies say that gas is about 30 times as cheap as electric light, but Mr. Swinburne calculated that the cost of gas was about nine times as cheap as electric light. This, however, is only one side of the question. If cheapness were the only consideration, it would be best to light a house up by providing a large fire in the middle of each room; but, of course, the fumes from the fire would do so much damage to the house that this method would be quite impracticable. The fumes from gas, although not so obnoxious as those from a fire without a chimney, are, nevertheless, very damaging; a house lighted by gas needs redecorating every four years, while with electric light it would not need redecorating more than once in six years. If you take a house in London and use electric light, and thus render it possible to redecorate it every six instead of every four years, the economy in redecorating will just counterbalance the extra cost of the electric light. In addition, the injury done to leather-bound books, and the extra cost for servants necessitated by the tarnishing of plate, when gas is used need to be considered. Taking everything into consideration, the electric light would be cheaper than gas for lighting purposes, even if the gas companies would supply their gas for nothing. Mr. Swinburne referred to the fact that light is obtained more economically if the carbon-filament lamp is "over-run," but over-running means a shorter life for the lamp. Most householders run their lamps at too low an efficiency, and also for too long a time. In many cases lamps are still used in houses after they have become so blackened that a large percentage of the light emitted by the filament is absorbed.

Digitized by Google

Within the last few years several improved forms of incandescent lamps have been put on the market. The first of these was the Nernst lamp. In this lamp zirconia is used as the basis of the conductor to be heated by the electric current; its high melting point renders it possible to raise the conductor to a much higher temperature, and therefore to obtain light which is both more economical and more like sunlight. The worst thing about these lamps is that they give a good deal of trouble. When switched on they do not light up at once, since a current has to be sent through a heating coil in order to raise the temperature of the glower to the point when it becomes conducting before the electric current can pass through the glower. This is sometimes very annoying. For instance, a man goes down to his wine cellar, where a Nernst lamp is in use; he turns on the switch and nothing happens, when he probably says something and lights a match, gets what he wants, and goes away. Afterwards the lamp lights up and burns until someone again visits the cellar. On going into a dark room you will probably have to wait a quarter or half a minute before you can get a light. In the latest types of Nernst lamps small carbon-filament lamps are provided, which become luminous when the Nernst lamp is switched on, while when the Nernst lamp lights up the subsidiary lamps are switched out automatically.

One of the latest forms of electric incandescent lamp is the tantalum lamp. Tantalum is a metal which is not in general very well known. It is nearly, or quite, as hard as the diamond, and rather stronger than steel. The German firm of Siemens and Halske have succeeded in shaping this metal into very fine filaments, and making these into lamps. The high melting point of tantalum renders it possible to raise the filament to a much higher temperature than would be practicable in the case of carbon filaments, and thus greater economy is effected. In addition, the resistance of tantalum increases with the temperature, while the resistance of carbon remains stationary, and under certain circumstances decreases with the rise of temperature, with the result that an accidental rise of pressure that would destroy a carbon filament has no harmful effect on a tantalum filament Were it not for the high price of tantalum lamps, carbon-filament lamps would no longer have a chance against their latest rival, but when a carbon-filament lamp can be obtained for a few pence, people are loth to pay three, four, or five shillings for a tantalum lamp, however great its advantages may be.

The osmium lamp was invented by Auer von Welsbach, the inventor of the gas mantle. Osmium is about as rare as tantalum, and about as difficult to work. The osmium lamp is a very promising lamp, indeed, but the difficulty is to obtain a filament long enough and thin enough to possess a sufficiently high resistance for the ordinary pressure at which electricity is supplied. However, lamps have been made to withstand a pressure of 110 volts, and two of these may be coupled in series across 220-volt mains. The osmium lamp has the further advantage that very efficient lamps can be made from it to run at very low pressures, even below 50 volts. Portable osmium lamps lighted by means of a secondary battery have been supplied by the Electrical Power Storage Company; these should be very popular, as they can be turned on at an instant's notice wherever they happen to be wanted.

The Cooper Hewitt lamp utilises the light emitted when an electric current passes through mercury vapour. In its original form it was unsuitable for domestic lighting, since the colour of the light emitted is something between green and blue, and would render the most beautiful lady's complexion hideous. It is, however, excellent for use in drawing offices, and it is being used with great success in photography. It has a very high efficiency—that is, it dissipates very little power in proportion to the light which it emits. Mr. Bastian has invented an improved form of mercury lamp specially arranged for domestic lighting; a carbon-filament lamp is run at so low a pressure that it only emits red light, and this combined with the blue and green light from the incandescent mercury vapour forms a very good light indeed. This lamps brings the cost of electric light down to that required in the case of gas, without taking into consideration the deleterious effects of the latter.

ELECTRIC LIFTS AT OLYMPIA.

BY A. H. SHAW, M.I.E.E.

Although the number of lifts exhibited at the exhibition is not large, several well-known firms being unrepresented, sufficient may be seen to prove to visitors that great improvements have been effected during the past 10 years in this industry. The general tendency has been to perfect the various systems of electric control, and to develop the various safety devices so as to render the operation of the lift perfectly safe and "fool-proof." These results have been so successfully attained that nearly all passenger lifts now erected are fitted with some form of electric control in preference to the old hand rope, and the safety devices adopted are such that in ordinary work it would be almost impossible for an accident to occur, all causes of accident being efficiently guarded against.

The only lifts working in the exhibition are the two passenger lifts erected by the Easton Lift Company, Limited, and used for conveying visitors from the floor to the gallery. Each equipment is of sufficient capacity to carry 12 passengers at each journey, and the method of control is the

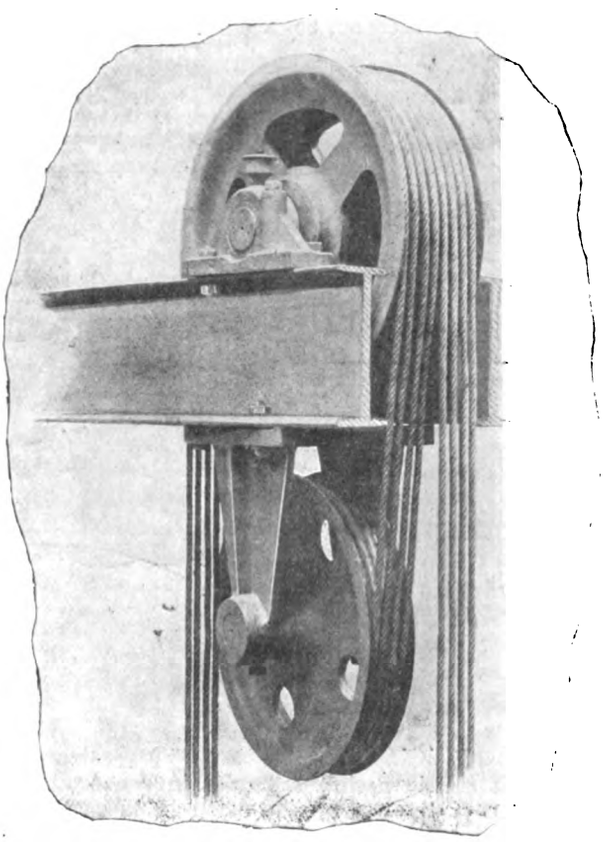

FIG. 1.—Easton's Patent Cross-over Drive for Lifts.

company's special "car-switch control." This form of switch is claimed to have several advantages over other makes, the following being a few of the more noticeable: it is fitted with magnetic blow-outs at all points where arcing might set up; it contains a special shunt-break switch by means of which the shunt circuit is never opened, but may discharge through the armature circuit when the supply is switched off; it enables the attendant to slow up gradually when stopping, and by its use the car may be moved any distance, even as little as ¼in. if required. The switchgear in connection with the controller is mounted on a panel fixed adjacent to the motor and driving gear, and consists of main switches and a solenoid switch, which cuts resistance out of the armature circuit when the motor is started, automatically reinserting it again in the armature circuit whenever the lift is stopped. Easton's patent cross-over drive (Fig. 1) is used and shown in connection with these lifts. Instead of using a wide drum and separate ropes for the car and counterbalance, as with the usual form of drum drive, the ropes connecting the car and counterbalance are continuous, and after passing around the driving sheave they are taken round an extra cross-over sheave fixed imme-

Digitized by Google

diately adjacent. This driving gear takes up less space and headroom than the ordinary drum type, and as the ropes are continuous, and the drive is positive in effect, no slack cable device is required. Four ropes are used instead of two, as with the usual drum type, and by means of an equalising device the strain is distributed equally between all the ropes. In addition to the type of lifts exhibited at the exhibition the Easton Company also manufacture goods and service lifts of all types operated either by hand rope, car switch, or push button, and they are now able to supply a high-speed lift with push-button control, the car automatically speeding up when starting, and slowing down when approaching the floor at which it is desired to stop.

Messrs. Geipel and Lange exhibit a working model of a passenger lift operated by their system of car switch control, the switch and controller being of the usual working size. The switchboard erected by the side of the model is of special interest. The whole of the gear controlling the motor is fixed on this panel, which is supplied complete ready for connecting up. At the top of the panel a double-pole main switch is fixed, this switch being fitted with magnetic blow-outs. Adjoining this switch is a solenoid operating a six-contact switch. Under these two double-pole direction switches are fixed, only one of which can be operated at a time, according to the direction in which the car switch is thrown over. There are also five single-pole switches, which are operated by the solenoid switch above referred to. Four of these switches are connected to a resistance in the motor armature circuit, while the fifth controls a rheostatic brake. This brake is provided in addition to the usual magnetic brake, and consists of a resistance which can be inserted across the armature, thereby slowing up the motor without the assistance of the magnetic brake if necessary. The switchboard also contains a single-pole switch, which operates the solenoid hand brake, and a solenoid switch for inserting resistance into the field of the motor for increasing the speed if required. The car switch is fitted with a spring, by means of which, when at rest, it is always kept in the centre or "off" position. If when running the attendant releases his hold of the switch, it returns to this position, stopping the car. In operating, the switch handle is first moved a short distance to either side, according to the direction in which it is desired to travel. This movement closes the main switch, one of the direction switches, and the switches actuating the magnetic and rheostatic brakes, the motor starting up with all resistance in the armature circuit. The solenoid switch then comes into operation, the speed of this being regulated by an adjustable governor. This switch actuates the single-pole switches, which cut out the armature resistance, accelerating the speed of the motor. By moving the switch handle farther over, the field solenoid switch is brought into action, resistance being cut into the field circuit and the speed further accelerated. The lift is provided with the usual safety devices to prevent overrunning, etc. In addition to the working model shown, Messrs. Geipel and Lange also supply controllers for use with all types of lifts, including hand-rope, car-switch, or push-button control.

A working model of the "Stigler" lifts is shown by Messrs. J. E. Spagnoletti and Co., for which they are the sole agents in the United Kingdom. This lift is controlled by push buttons, and is particularly adapted for use in private houses, flats, etc., as no attendant is required. Push buttons are fitted inside the car, numbered to correspond with the different floors, and to operate the lift it is only necessary to close all gates and to press the button corresponding with the floor required, when the lift will immediately travel to the floor required, stopping automatically. After leaving the lift and closing the gate, a push button outside may be pressed, returning the car to the ground floor. Contacts are fitted to all the gates, and if any gate is left open the lift is rendered inoperative. A special regulator is fitted to these lifts by means of which the car stops level with the floors irrespective of the load. The controlling switches are actuated by a series of relays fitted with carbon contacts, which are actuated through floor contacts fixed in the lift well. The usual safety devices for stopping and holding the car, should any accident occur to the ropes or the driving gear, are also fitted. A very large number of these lifts have been erected on the Continent for use without any special attendant, and are giving every satisfaction.

The Sturtevant Engineering Company's car-switch system of control for lifts (Fig. 2) is shown in operation, the controlling switch and subsidiary switches being mounted on a panel and actuated by the operating switch, which would be fixed in the car. They also exhibit types of their lift controllers for operating by hand rope, in addition to many other types of controllers for various purposes.

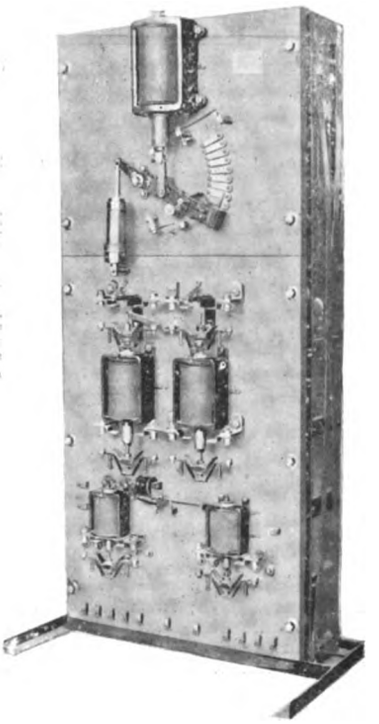

FIG. 2.—The Sturtevant Automatic Control Gear for Electric Lifts.

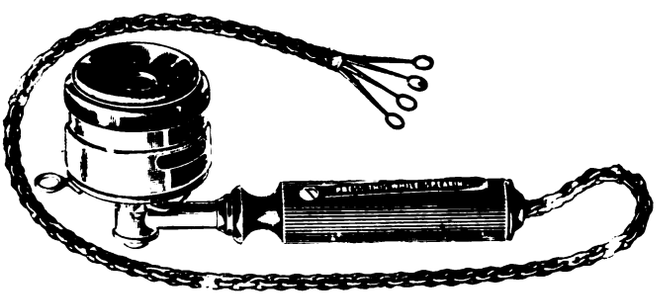
Messrs. Rumney and Rumney exhibit lift controllers connected to alternating and direct current motors. The alternating motor exhibited is a single-phase motor designed specially for this purpose, and has a high starting torque. It is supplied by Mr. T. Harding Charton, and may be started, stopped, and reversed as easily as a direct-current motor.

Dinner or service lifts, operated by push buttons with automatic stops, are also shown in operation by Messrs. Drake and Gorham and Electromotors, Limited.

TRADE NOTICES AND NOVELTIES.

Hygienic Telephones.

To those to whom the ubiquitous bacteria constitute not an imaginary but a real danger, the introduction of the instrument shown in the accompanying illustration will be particularly



welcome. The difficulties attending the effective sterilisation of the germ-infested telephone mouthpiece have been cut by the General Electric Company by the simple means of doing away with the mouthpiece altogether. They are now placing on the market a combination of receiver and transmitter which is contained in a small metal case shaped like a watch. This is kept continuously to the ear both when speaking and listening, the person speaking apparently addressing himself to the empty air. The usual handle with spring switch is attached to the case. The trans-

Digitized by Google

mitter has two large apertures which admit the sound waves, and has been made more sensitive by means of carbon plates which contain 40 little cells, each being filled up with shot carbon, consequently the whole of the transmitter is rendered sensitive instead of the centre portion only. We had an opportunity of testing this instrument, and found that the transmission of sound was equally as good as if a mouthpiece had been used. Our illustration represents the article as it will be placed on the market. The experimental instruments shown us were not a hand combination, but were of the watch type. Both the ringing key and the switch for the speaking circuit were mounted on the same. They were distinguished by different coloured press buttons.

STOCKTON-ON-TEES ELECTRICITY ACCOUNTS.

The accounts of the Stockton-on-Tees electricity department for the year ended March 31, 1905, show a total expenditure on capital account to that date of £51,275. Abstracts of the revenue account and balance-sheet are given herewith.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.
To generation of electricity	2,098	6	8

STATEMENT OF ELECTRICITY GENERATED, SOLD, ETC.

Quantity generated in B.T.U.			1,718,665
Quantity sold: Private consumers by meter	477,065		
By contract	7,190		
Traction	283,081		1,389,591
Public lamps	622,255		
Quantity used on works			134,012
Total quantity accounted for			1,523,603
Quantity not accounted for			195,061
Maximum supply demanded (kilovolt-amperes)			1,090

Number of public lamps: 388 arcs, 18 incandescents, 3 Nernst.

PERSONAL.

Mr. Portley, Limerick, has been appointed junior assistant at the Limerick Corporation's power station.

Mr. Burnie, chief lecturer in the electrical engineering department of the Royal Technical Institute at Salford, has been appointed principal of the Croydon Polytechnic.

Mr. Chas. Gorick has left the General Electric Co. to take over the position of general manager to the Amalgamated Dry Batteries, whose offices are 16 and 17, Devonshire-square, E.C.

Mr. F. O. J. Roose, assistant electrical engineer of Bournemouth, having been appointed assistant resident engineer under the London County Council, Mr. H. G. Andrews has been appointed to Mr. Roose's position, Mr. Keene to Mr. Andrews's position, and Mr. J. H. Chick, of Acton, as shift engineer.

We understand that Mr. A. Eckstein, who has been connected with the General Electric Co. for the last 18 years, and since the formation of the company in 1900 has held the position of managing director and head of the Manchester factories and supply house at Victoria Bridge, will terminate his connection with the company on Oct. 15. Mr. Eckstein has not yet finally settled upon his future work, but as he has been connected all his life with electrical manufacturing we shall no doubt hear of him in that capacity again.

A unique gathering took place at the Hotel de Bale, Hatton-garden, on Saturday evening (Oct. 7), when a score of the old boys who were at Scott's Engineering Works in 1888 and 1889 met together, mostly for the first time after an interval of 16 years. There were present Messrs. F. Armfield, E. S. Davidson, E. Eberzein, R. M. Elmhurst, F. N. Haward, Jackson, A. B. Lillywhite, H. Marryat, E. C. Moyes, E. L. Pinching, W. M. Rogerson (Halifax), C. N. Russell (Shoreditch), H. Sadd, J. R. Smith, H. Squire (Chelsea), C. E. W. Talbot, W. C. Thomson, W. E. Toy, and J. Watts. Letters and telegrams of regret at unavoidable absence were received from Messrs. B. Arkell, C. D. Asprey, J. H. Garrett (Colombo), A. J. Hodgson, L. A. Jinks, E. C. Patey, H. A. Place, C. E. Tickner, and Tubbs. The function, which was of an informal nature, was voted a complete success. An excellent concert followed, and a proposal to make the reunion an annual affair was carried by acclamation. Another proposal to repeat the function before the close of the present year was received with favour, and we learn will be brought about if possible. Mr. H. Marryat, of 28, Hatton-garden, E.C. was appointed the hon. secretary, and will be glad to receive the addresses of old boys whose names do not appear in the above report.

APPOINTMENTS VACANT.

Junior Assistant Engineer, York City Council. Salary, 30s. per week.

Traffic Manager, South Shields new electric tramways. Salary, £200 to £250.

Premium Pupil, Electricity Works, Canterbury. See advertisement in last issue.

Electrical Foreman. Applications to Box P 50, *Electrical Engineer* Office. See advertisement in last issue.

Switchboard Attendant. Wages 20s. per week. Applications to Engineer, Electricity Works, Canterbury, by Oct. 14. See advertisement in last issue.

Chief Lecturer, Salford Royal Technical Institute, electrical engineering department. Salary, £250. Applications by Oct. 19. See advertisement.

Junior Assistant, Aldershot Urban District Council electricity works. Salary £65 per annum. Applications by Oct. 18. See advertisement in last issue.

THE INFLUENCE OF ELECTRICITY ON POWER ENGINEERING.*

BY W. B. ESSON, M.I.C.E., M.I.E.E.

Gentlemen,—My first duty in taking this chair is to thank you for the honour you have conferred upon me in electing me your president. So many good men have occupied the chair previously that a somewhat high standard has been set, and I can only promise to do my best towards keeping it up during my term of office. My next duty is to congratulate the society on its continued prosperity. Though a small society, we are very much alive, and the report of the council for the forty-sixth session and auditors' report are most gratifying, and must be a source of considerable satisfaction to the hon. secretary, who works so hard in the interests of the society, and to the hon. treasurer, who has to foot the bills. There are few things more comforting than the knowledge of a good bank balance, but the council recognise that there is much yet to be done, and something fresh for the good of the society is always under consideration.

Amongst the things which are expected of a president is a presidential address. Apparently there is no escape from this, and I should think it must always be a very difficult matter to decide upon the subject of such an address. To me the choice of a subject has presented, I must admit, considerable difficulty, for though one feels that one can speak best on some special matters with which one's work has been principally associated, on the other hand one must not in a presidential position specialise too much, but must try rather to interest in some degree all the members, notwithstanding that the special work upon which they are severally engaged is so greatly diversified. As you will know, I have been intimately connected for the past 25 years with electrical undertakings, and the change which electricity has made in the methods of industry during that period are little short of revolutionary. Electricity is now of universal application, and it is quite safe to say that there is no branch of engineering to which it cannot in some shape or form bring advantages. I will take it as a fortunate circumstance if, in addressing you from the chair on a subject which is specially my own, I can command your attention, and I trust that in talking for a short time on "The Influence of Electricity on Power Engineering" I will be saying something which is of some interest to all.

The early seventies saw the inventions of Gramme and Von Hefner Alteneck and the beginning of the electric lighting era. The first of Gramme's dynamos was brought to London in 1873, but needless, to say, it little resembled its progeny. Six years before Gramme obtained his first patent Pacinotti had illustrated and described in the "Nuova Cimento" the remarkable machine of his invention, and though this probably embodied in crude form all the elements of Gramme's dynamo, it required the mechanical genius of Gramme to convert into a practical machine what had been till his time a scientific toy. About the same period the Von Hefner Alteneck machine was being developed in Germany, but the early designs of both types were flimsy and built on the lines adopted by mechanicians and instrument makers rather than on engineering lines. Soon the designing passed into the hands of engineers, and the flimsiness of the earlier patterns disappeared. It was realised that the dynamo was a machine which might have to deal with the conversion of considerable amounts of power, and that only the best engineering methods should be adopted in its construction. From these early days till now progress has been continuous. In 25 years the size of electric generators has increased from 5 h.p. to 5,000 h.p., from the machines which fed the Jablochkoff candles in the Avenue de l'Opera in Paris to the magnificent triumph of engineering realised in the generators at Niagara.

The principle of reversibility of electric machines seems to have been understood some considerable time before the advent of Gramme's machine, and very soon after its appearance power was transmitted, using the ordinary lighting dynamo as motor. The first public demonstration was made during the Vienna Exhibition of 1873, when the current was transmitted from a machine working as a generator to a second machine, about 550 yards distant, working as a motor and driving a pump. But in these early days there were only arc lamps used for illumination, and for some considerable time engineers devoted their energies to the design of machines for feeding arc lamps. Power work was accordingly put on one side, and for a time there was very little progress in this direction.

It was not until 1880 that the first incandescence lamp factory was started on a commercial basis. In the early seventies not only was there no practical incandescence lamp, but, as the result of much experimenting, we have it from Mr. Swan that there was no expectation or faith among scientific men of the probability of such a thing being produced. However, the unexpected came to pass, as I say, in 1880, and gave a tremendous fillip to electrical engineering. In 1882 Gaulard and Gibbs came along with the transformer, but it was not until 1885 that transformers were taken seriously. By that time Ganz, of Budapest, had worked out a system of distribution in which transformers were connected in parallel on a high-tension primary circuit, and supplied consumers from a low-pressure secondary. They exhibited one of their transformers at the Inventions Exhibition in 1885, and from that time it may be said that the era of alternating currents commenced. With a few exceptions, all the long-distance power transmission enterprises of to-day are dependent upon alternating currents.

The transformer appeared on the scene in the nick of time, because just then the continuous-current three-wire system for supplying 100 to 110 volt lamps was finding its limit as regards distance for distribution from the generating station. Accordingly, the alternating-current transformer system had a splendid run for lighting from 10 to 15 years. This was until the 220-volt incandescence lamp made its appearance. As working at double the pressure enabled the current to be distributed over four times the area with no greater cost for mains per lamp supplied than before, the advent of the higher voltage lamp brought continuous current to the front again. So far as lighting was concerned, alternating-current distribution then practically ceased, and continuous current still holds its own.

From 1880 onwards power transmission made progress. The arc lighting work had taught manufacturers how to make machines for higher pressures, and the demand consequent on the invention of the incandescence lamp gave the necessary stimulus to development. To Marcel Deprez belongs the honour of conducting the first long-distance transmission experiments. During the Munich Exhibition of 1882 a demonstration was made. On this occasion Deprez transmitted power from Miesbach to Munich through a double line of telegraph wire over a distance of 37 miles with a pressure of 2,400 volts at the generator. The machines used on this occasion were two ordinary Gramme dynamos, but with the usual winding replaced by coils of many turns. About this period many installations were erected for the transmission of power to moderate distances. These were chiefly in places where water was abundant, but in 1887 several installations had been set to work in British collieries for pumping and haulage. A notable example of these early undertakings was the installation at the Falls of the Rhine, erected in 1887 to transmit 500 h.p. at 700 volts to the Schaffhausen spinning mill, rather less than half a mile distant from the power-house. The Kriegstettin and Solothurn installation, put down in 1888 to transmit 50 h.p. a distance of five miles at a pressure of 2,000 volts, was another. Still another was the installation at Domène, erected near Grenoble in 1889 to transmit 250 h.p. rather over three miles at a pressure of 2,850 volts to drive a paper mill.

A point to be noted here is that there was no such thing as transmission of power in the sense that we now understand it until the electric motor made its appearance. There was on the Continent the wire-rope transmission system of Hirn, by which the power of turbines could be conveyed to short distances, but there was no system by which transmission could be effected to distances of even a few miles without enormous loss. Hirn's system had met with great success, for within 10 years of its intro-

* Presidential address to the Civil and Mechanical Engineers' Society, delivered Oct. 5, 1905.

Digitized by Google

duction there were no less than 400 transmissions at work in South Germany and Switzerland transmitting in the aggregate 4,200 h.p. For short distances the system was very efficient, giving a return of about 96 per cent. for 100 yards and 93 per cent. for 500 yards; but at the best it was but an extension of ordinary rope driving, and calculation shows that for a three-mile transmission the return would not have reached 60 per cent. Hydraulic and compressed-air transmission were both of them capable of doing excellent service in their own domain, but they were both useless as a means of transmitting power economically to any considerable distance.

The fact that similar alternators could be run as generator and motor was clearly established in 1884, and the principles underlying their interdependence formed the subject of a mathematical paper read by the late Dr. J. Hopkinson in the same year, but it wanted the demonstration of Mordey in 1889 to push the fact home in a practical manner, and it was not until experiments had been carried out showing the transmission of 50 h.p. with two Mordey alternators used as generator and motor respectively that the possibility of employing machines in this way received general recognition. Little result, however, followed from the demonstration. Some few plants were installed, but in alternating current there was at that time nothing over 2,000 volts or so, and as continuous-current machines had been built for as high a pressure, the reason for change to alternating was not apparent. In 1892 the Westinghouse Company of the United States installed an alternating-current plant at Telluride, in Colorado, and transmitted at 50 h.p. to a distance of three miles by single-phase current at a pressure of 3,000 volts, using a synchronising motor to drive a 40-stamp mill. At this date, be it observed, there was no manufacturer in America who would tackle the problem of making continuous-current machines to transmit 150 h.p. five miles at any kind of efficiency, and we have it on the authority of Louis Bell that no one dared make a 2,000-volt machine of this capacity. In 1893 at Bodie, in California, another single-phase transmission was installed. There 150 h.p. was conveyed to a distance of 12½ miles at a pressure of 3,000 volts to drive by a synchronous motor the stamp mill and other machinery of a gold mine. But as a system, single-phase transmission did not make progress. For one thing the motors were not self-starting, and a certain amount of extraneous gear was required to set them going. The system was simple and perfectly suitable for cases in which the power was transmitted to one motor or a group of motors, but it was not suitable for a general scheme of power transmission where the motors might be of different sizes and distributed over a large area. For one large motor or group of motors the gear was not objectionable, but it would have utterly disqualified the system when repeated on a large number of scattered motors.

About this time (1889) engineers on the Continent were faced with a very important problem. They saw in their waterfalls thousands of horse-power running to waste. They knew that by adopting electric transmission this power could be utilised and distributed to great advantage amongst manufacturers scattered over a wide area, but they also recognised that success could only be obtained by the use of high pressure—that is, of a pressure considerably higher than the 2,000 or 3,000 volts then in use. With alternating current, the increase in pressure was perfectly feasible, but for this system there was no motor available. For reasons I have just given the use of small alternators as motors could not be entertained. The continuous-current motor was at this date perfectly reliable, but 400 to 500 volts was the utmost pressure that in the then state of the art was thought safe for medium-sized motors, rising possibly to 2,000 volts or so for large ones. To continuous-current generators the same remark applied, as 2,000 volts or so was deemed the highest safe pressure to put on commutators of the Gramme type. This pressure has not been greatly exceeded at the present day, but to carry out the schemes our friends on the Continent had in view required much higher pressures. It will be seen that the problem required a considerable amount of study, the position being: for alternating currents, pressure all right, but no motor available; for continuous currents, motor available, but pressure not high enough. As the supply of power was the leading idea, the system which possessed the motor had to be chosen, and continuous current was consequently adopted, with the brilliant device, however, of joining up all the motors in series, and spreading the high pressure over the lot, while connecting the generators in series to keep down the pressure on the commutators of individual machines. In this system the current is kept constant, the pressure varying according to requirements, and at the date I am speaking of it does not appear that there was any other way of providing a general power supply. It says much for the engineering of the installations on this system that they are in most successful working to-day, and, what is more, they are being added to in competition with the three-phase system. The first installation on this system was erected for the transmission of power to Genoa in 1890. At the present date there are three generating stations, in each of which are turbine-driven continuous-current dynamos all coupled in series. In the two larger stations there are eight dynamos, and the pressure is from 6,000 to 8,000 volts. At full load about 1,000 h.p. is transmitted from the three stations over the lines to Genoa, a distance of 18 miles, to drive motors varying from 10 h.p. to 120 h.p. in size, all being connected in series. A considerable number of installations on similar lines have been laid down, some of them of great importance. Amongst these is the Brescia transmission of 700 h.p. at 15,000 volts over a 12-mile line, and the larger installation for supplying La Chaux-de-Fonds with 2,400 h.p. at 14,400 volts over a 32 mile line. Another installation is at work transmitting 4,000 h.p. at 22,000 volts over a 34-mile line from St. Maurice to Lausanne, and there is in course of construction the largest of all designed to transmit 6,000 h.p. at 60,000 volts over a line 114 miles long from Moutiers to Lyons.

Now a system showing such strong vitality, though working on what nine-tenths of our engineers would call antiquated lines, cannot be dismissed in a sentence. The facts are that the system is going ahead in the face of the three-phase alternating system, and is successful on a scale commensurate with many of the larger three-phase installations. The Americans say that the success of such a system would be impossible in their country, because the motors would not there get the careful and skilled attention given to them on the Continent. This may be so, but with a large plant and sub-station the objection need not hold In any case it is certain that every engineer will look forward with the greatest interest to the completion of the large scheme now in progress.

It was at the Frankfort Exhibition of 1891 that the problem of long-distance transmission was satisfactorily solved. In 1885 Prof Ferraris had constructed a rudimentary motor which depended for its action on a rotating field produced by two alternating currents in quadrature. From this date, and independently, there were working at the same subject Cöerper, Haselwander, and Dobrowolsky on the Continent, and Bradley and Tesla in the States. The results which had been achieved by the Continental workers were apparent in the exhibition at Frankfort, several manufacturing companies showing machinery operated by two or three alternating currents having a phase difference between them with regard to time. The Allgemeine Elektricitäts-Gesellschaft of Berlin and the Oerlikon Machine Company of Zürich combined to demonstrate at this exhibition on a commercial scale the transmission of power to great distances by means of alternating circuits. For this purpose they chose to work with three circuits—that is, on the three-phase system—and their epoch-making experiments consisting in transmitting through three wires over a distance of 110 miles at 8,000 volts 110 h.p from Lauffen to Frankfort. Experiments with a pressure of 20,000 volts between the wires were also made, there being transmitted in this case 180 h.p. with results eminently satisfactory. Of the energy given to the generators at Lauffen about 75 per cent. was returned by the motor at Frankfort, a magnificent result as compared with the return of less than 50 per cent. which nine years previously was obtained by Deprez in the Miesbach-to-Munich transmission. This demonstration bore immediate

Digitized by Google

fruit, for it was realised that the problem of transmitting power to long distances was no more a question of system. The system was found, and the matter was resolved into a case of merely working out the engineering details for particular schemes. A tremendous impetus was given to power transmission in Europe, and soon a large number of installations were working on the new system transmitting power to distances up to about 15 miles at pressures in the vicinity of 5,000 volts or so.

The first polyphase plant in America was erected at Redlands, California, in 1893, and worked at 2,500 volts to transmit the power eight miles. In the same year the Niagara contract for power-house No. 1 was fixed up, which now has a capacity of 50,000 h.p Since then power-house No. 2 has been erected, which has a capacity of 55,000 h.p., making 105,000 h.p. altogether, as representing one company's drain on the great cataract. But there is not only one company but several taking a water supply, and it is estimated that when all the power-houses in progress are completed they will send out an aggregate of no less than 700,000 h.p.

The pressure given by the Niagara generators is not high, nor is the pressure on the lines to Buffalo over which from Niagara 24,000 h.p. is transmitted. Originally the pressure on the Buffalo lines was 11,000 volts, but in 1901 it was raised to 22,000 volts, consequently it does not exceed that of the transmission from Lauffen to Frankfort 10 years before. It was not until 1897 that any increase over the Frankfort pressure was made, but in that year the South Californian Power Company transmitted power over 80 miles at 33,000 volts. Several plants were installed at this pressure, and in the meantime experiments were being vigorously prosecuted with the object of finding out whether a still higher voltage could not be successfully employed. These experiments culminated in the Telluride Company adopting in 1898 a pressure of 40,000 volts for their Provo transmission, and at the present time there are several installations in the States working at this pressure. The Shawinigan Water and Power Company is operating over a line 84 miles long with 53,000 volts. The Washington Power Company, the California Gas and Electric Company, and the Guanajuato Power and Electric Company are all operating at 60,000 volts, while the Kern River Power Company is busy with a line on which the pressure will reach 67,500 volts. This is for the time being the highest pressure in the world, but two companies are making provision for their apparatus to be capable of working at 80,000 volts, so that whenever suitable methods of insulating for this pressure are devised they will be able to adopt it. Lord Kelvin may yet see in actual practice the figure he assumed as a possible voltage at the 1881 British Association meeting. At that date there was no polyphase machinery in existence and no transformer, so 80,000 volts was purely a guess. Nevertheless, we have already passed it in the laboratory, and before long may realise it in practice.

In Europe the pressure on transmission lines does not rule high. The distances are not great, and under these circumstances it is preferred to keep the line pressure down to a figure which is possible to the generator armatures and does not require the use of step-up transformers. At the great hydro-electric stations of Vizzola and Paderno, for example, the pressure is only 11,000 volts and 14,000 volts respectively. On the power lines of the Milano-Verese Railway the pressure is 13,000 volts, while on those of the Valtellina Railway it is 20,000 volts. Lately a power installation for the transmission of 3,300 h.p. from Gromo to Nembro through 22 miles of line has been put to work at 40,000 volts, but this is quite exceptional, and stands alone amongst European undertakings. A most interesting example of a power installation in the Far East is furnished by the Mysore transmission of 4,000 h p. from the Cauvery River Falls to the Kolar goldfield, a distance of 92 miles, at 30,000 volts. The Falls of Foyers, in Scotland, have been utilised by the British Aluminium Company to generate the electricity necessary to their process of aluminium manufacture, but this is not electrical power transmission as we understand it. In North Wales, however, a pioneer hydro-electric transmission installation is close upon completion, which the engineers tell me will be supplying current very soon. The power is derived from Llydaw, on Snowdon, and there will be transmitted in the first instance 4,000 h.p. at 11,000 volts for the working of light railways in the district and for power purposes generally. A scheme which the Scotch Water Power Syndicate have in view is the transmission of 5,000 h.p. to the Vale of Leven from a hydro-electric power station 22 miles distant supplied with water from Loch Sloy, which is situated 750ft. or so above Loch Lomond. Here the pressure proposed on the overhead transmission line is 40,000 volts. But the scheme is at present in the air, and whether the conductors will ever get there I would not like to say.

Unless the power transmitted is very large the lower the pressure the better, provided that it is high enough to allow of the transmission being carried out economically. It would be folly to assert that there are no greater risks with the higher pressures, for, as a matter of fact, with pressures of 40,000 to 60,000 volts "the highest intelligence, vigilance, and excellence must be employed to avoid accidents and ensure success." These pressures are not to be used indiscriminately or when they can be avoided. A large number of plants are operating pressures between 10,000 and 20,000 volts, and of these it may be said that the overhead lines give very little trouble. The latter figure represents a voltage which can be produced in the armatures of machines of moderate size without difficulty, so this pressure may be considered a limit below which step-up transformers may be dispensed with. When we get much above this we enter a zone where we begin to experience the line troubles which very high pressures bring without obtaining all the corresponding advantages they confer. It is very questionable, therefore, whether there should be any halting place between 20,000 and 40,000 volts. At 33,000 volts Dr. Perrine tells us that the special difficulties due to capacity, insulator size, erratic lightning arrester effects, and switching begin to make themselves seriously felt, and it is just as well if we have to redesign the apparatus with special reference to these difficulties, that we may carry the pressure to the other extreme of the zone referred to, and so get the full return for our trouble. If high pressures are ever standardised, the figures for the standards will be probably 20, 40, 60, and 80 kilovolts.

With pressures of the order of 40,000 volts quite a new set of phenomena is brought to our notice. In the first place, the insulators, in order to prevent flashing over to the supports, must be very much larger, and an increase of pressure from 20,000 to 40 000 volts necessitates their diameter being increased by 50 per cent. or more. A usual size of insulator for the former pressure is 6in. diameter, while the latter should not be less than from 9in. to 10in., with the addition of at least one intermediate bell between the outside dome and the inside cup. When these high pressures are used, the phenomenon of brush discharge has to be provided against. This results from the break-down of the air as an insulator owing to electrostatic strain set up in the space between the wires, and it was very thoroughly investigated by several leading engineers in America in 1893. Their experiments showed that while the loss of power due to this cause at 40,000 to 50,000 volts was, with the usual line construction, inconsiderable, after the higher figure was reached the loss increased rapidly. Prof. Ayrton has lately worked out the distance wires of different diameters have to be placed apart to ensure that with certain pressures there shall be no brush discharge. The cure of the evil, of course, is to keep the wires far enough apart and keep them large enough in diameter, for it is common knowledge that in the vicinity of a sharp point or a sharp edge, less pressure is required to break the air down than in the vicinity of a knob or well-rounded edge. A thin wire presents along its whole length a comparatively sharp edge, and while with wires of $\frac{1}{10}$in. diameter 40,000 volts will discharge through about 10ft., if the wire is $\frac{1}{4}$in. diameter discharge will only take place when the distance between the wires has been reduced to 15in. As it is usual to space the wires on a 40,000-volt line about 48in. apart, and as in no lines requiring such high-transmission voltage are wires likely to be less than $\frac{1}{4}$in. in diameter, it will be seen that there need be no loss

Digitized by Google

from this cause, but there is enough trouble with switches, lightning arresters, and higher pressure surges in the line without brush discharge.

It is not the high pressure that makes the trouble last mentioned; indeed, raising the pressure reduces surging, since the current is reduced with the increased pressure. Experience has shown that if a large amount of power is transmitted, it is easier to operate lines at a pressure of 60,000 volts than at a pressure of 30,000 volts, because in the former case the current flowing is only about half. Suppose we are transmitting 5,000 h.p. to a distance of 50 miles at 30,000 volts. Roughly, the current in each wire will be 80 amperes, and it is possible that if this be suddenly interrupted the surge pressure would rise to 20,000 volts. If it happened that the line was momentarily short-circuited by a lightning discharge, and that during the short four times the working current passed, the surge voltage on the removal of this short-circuit might rise to 60,000 volts, which pressure would be superposed on the pressure. With 30,000 volts between the conductors, the pressure between any conductor and earth is 17,300 volts, so in this case the surge voltage makes the possible nearly four and a half times the working pressure. If we worked at 60,000 volts, however, the rise on breaking the short would only be 30,000 volts, and this superposed on the working voltage gives a possible pressure of rather less than twice the working pressure. The momentary strain which insulators, transformers, and other apparatus should be capable of standing is in the case of the 30,000-volt transmission 77,300 volts, while in the 60,000-volt transmission it is 64,400 volts. The higher working pressure has therefore the advantage, and if the power transmitted were increased, the advantage would be more pronounced. It is probable that on account of this rise in pressure due to circumstances the occurrence of which the greatest precaution will not always prevent, the current to be transmitted through each wire of long-distance transmission lines will not as a general rule exceed 100 amperes.

There is no hard-and-fast rule for pressures to be used, but 1,000 volts per mile is recognised as good practice. This is subject to limitation, on the one hand, by the highest pressure of which we have commercial experience, and, on the other hand, by the condition that the current in any wire shall not be excessive—a point which has just been dealt with. According to Mr. C. F. Scott, a distance in miles equal to three times the number of thousands of volts may be covered without incurring an excessive annual charge per horse-power for copper. This means that 5,000 volts would cover 15 miles, 10,000 volts 30 miles, and 20,000 volts 60 miles. That 10,000 volts has reached 28 miles and 30,000 volts 92 miles is shown by the installations at work. But the solution to all engineering problems lies in compromising, and the pressure is eventually settled by striking a balance between the cost and the risks undertaken. In this country the necessity for a higher pressure than 20,000 volts is unlikely to arise, at least, for some considerable time.

(To be continued.)

COMPANIES' MEETINGS AND REPORTS

BRITISH COLUMBIA ELECTRIC RAILWAY.

For the 12 months to June 30 the gross receipts show an increase over the preceding year of 91,687dol., and the net earnings, after charging renewals, show an increase of 44 531dol. The following charges have been made against the revenue account of the year—viz.: provision for renewals maintenance (from which £8,645. 18s. 7d. has been deducted for expenditure on renewals during the year), £16,564; bonus to employés, £3,611; amount written off preliminary and issuing expenses, £1,862; amount added to capital amortisation fund, £1,725. The net profit for the year, after making the above reductions, amounts to £57,876, which, with the balance brought forward from last year, is increased to £60,099. Deducting interest on debentures to June 30, £13,586, and interim dividends on 5 per cent. cumulative perpetual preference stock for six months to Dec. 31, 1904, £2 875, on preferred ordinary stock for nine months to March 31, 1905, £10,187, and on deferred ordinary stock for six months to Dec. 31, 1904, £9,000, there remains available for distribution and reserves £24,450. From this the directors have decided to provide for the dividend on the cumulative perpetual preference stock for six months to June 30, £2,875; to provide for the dividend on the preferred ordinary stock for three months to June 30, £3,750; to recommend the payment of a dividend on the deferred ordinary stock at the rate of 3 per cent., making 6 per cent. for the year, which, including income tax, will absorb £9,947; to write off the balance of preliminary and issuing expenses amounting to £1,650; to transfer to reserve fund £4,460; and to carry forward to next account £1,767. The number of lights in use at June 30 was 136,512, an increase of 23,601 over the number in use on June 30, 1904. The number of passengers carried during the year was 10,352,451, an increase of 1,482,955. During the year £107,445 has been spent in extensions and improvement of the company's property and equipment. A line has been built to the Gorge in Victoria, and a recreation ground covering 10 acres has been laid out at the end of the line. The Gorge extension has, state the directors, proved very popular with the Victoria public and with visiting tourists. In Vancouver a line has been built to Kitsilano (Greers Beach). This line was opened on July 4, and has since been very largely patronised. A traffic arrangement has been made with the Canadian Pacific Railway Co. in reference to their line built from Vancouver to Steveston, the principal city on Lulu Island and the centre of the salmon fishing industry on the Fraser River. Under the arrangement made the Company has electrified the line and has operated it since July 4. The operation is an unqualified success. In pursuance of the Company's well-established policy of giving the public the benefit of cheapened cost of production, voluntary reductions have been made during the year in the prices charged for electric light. The Vancouver power installation has been completed during the year, and is now in full operation. The directors are much gratified by the success of this very important undertaking, the results of which have exceeded their expectations. The full benefit of this new source of power was not obtained until June 1, so that the year's accounts are not largely affected by it. Practically the whole of the share capital of the Victoria Gas Co. has been acquired, and steps are being taken to improve and extend its plant. The results for the current financial year of taking over the Vancouver Gas Co. have been entirely satisfactory to the Company, and have been equally beneficial to the consumers, to whom the charge for gas has been reduced.

LANARKSHIRE TRAMWAYS.

At an extraordinary general meeting of this Company, held last week, Mr. A. R. Monks (the chairman) explained that it was proposed to raise additional capital to meet additional expenditure on the Larkhall extension by the issue of 5,400 new shares of £10 each. The shares were offered to shareholders at par—£5 per share on application and £5 on allotment. The proceedings were purely formal.

A resolution sanctioning the creation of capital was moved by the Chairman, seconded by Mr. H. C. Levis, and carried.

NEW COMPANIES REGISTERED.

Improved Electric Supplies, Limited. — Capital, £15 000. Objects: to acquire and take over the business formerly carried on by the Improved Electric Glow Lamp Co., Limited, to adopt an agreement with W. Chamberlain, and to carry on the business of electricians, mechanical and electrical engineers, electroplaters, manufacturers of, agents for, and dealers in electric lamps, fittings, plant, tools, and apparatus used in the employment of electricity, etc. Registered office: 7, Great Newport-street, W.C.

Liens Registered and Discharged.

Barsi Light Railway Co., Limited, London, E.C.—Trust deed registered Sept. 30 for £140,000 4 per cent. debenture stock. Trustee: Indian and General Investment Trust, Limited. Charged on the interest of the company in the Barsi Town Railway and certain extensions, lands, works, rolling-stock and plant, the undertaking, and all other assets, present and future, except the uncalled capital.

N. S. Electric Storage Co., Limited, London, E.C.—Lien registered Sept. 29 for £1,000 6 per cent. debentures, part of £20,000; amount previously issued, £1,800; no trustees; charged to the undertaking and all the property and assets, present and future.

Lowden Electric Lamp Co., Limited, (Watford).—A debenture dated Sept. 22, 1905, to secure £100, charged on the company's undertaking and property, present and future, has been registered. Holder F. N. Bell, 3, Campden-hill-square, Holland Park, W.

Motor Traction Co, Limited.—A memorandum of satisfaction in full of charges, dated Sept. 3, 1901, and Feb. 4 and March 4, 1902, securing in all £11,000, has been filed.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Burslem (Staffs).—The Corporation require tenders for lighting St. John's Market by arc lamps. Tenders by Oct. 18.

Edinburgh.—The Corporation require tenders for arc lamps and arc lamp-posts. Tenders by Oct. 23. See advertisement.

Madrid.—The Public Works Department require designs for a scheme of electric tramways in the town. Particulars from Direccion General de Obras Publicas, Madrid. Tenders by Nov. 27.

Utrecht.—The Government Railways require tenders for Contracts 215-219—for steel plates, tirefonds, bolts, etc. Specification (1s.) from

Digitized by Google

the Chief of Works and Stores, Morcelse Park, Utrecht. Tenders by Oct. 24.

London, S.W.—The London County Council invite tenders for wiring and fittings for the electric lighting of the bandstand in the Villiers-street section of the Victoria-embankment Gardens. Tenders by 10 a.m. on Oct. 25.

Great Western Railway.—The directors of this company invite tenders for the supply of various stores from Dec. 1 next to Nov. 30, 1906. Specification, with forms of tender, may be obtained at the office of the Stores Superintendent at Swindon. Tenders to Mr. G. K. Mills, secretary, Paddington Station, London, by Oct. 16.

RESULTS OF TENDERS.

Warrington.—Messrs. Thomas Piggott and Co. have obtained an order for a transporter bridge at Warrington.

Canterbury.—The City Council have accepted the tender of C. Browning, at £24, for external painting at the electricity works; and the tender of Philpot and Son, at £11, for electric fittings.

Stafford.—The Town Council have approved the terms of the agreement with the Tudor Accumulator Co. for the supply of a storage battery composed of 310 cells and the maintenance thereof for 10 years.

Battersea.—The tender of the Municipal Appliances Co., at £60, for one bitumen boiler of 600 gallons capacity, which is required particularly in connection with the extension of electric mains, etc., in Nine Elms ward, has been recommended for acceptance.

Oulton Broad.—The Urban District Council have accepted the tender of the Oulton Broad Electricity Co. for 16-c.p. lamps, at £2. 2s. 6d. per lamp per annum, moonlight schedule, which includes the upkeep of the fittings as well as the supply of current.

Brighton.—The Town Council have accepted the offer of the British Westinghouse Electric and Manufacturing Co. to provide and fix cast-iron facias to the switchboards now being erected by them at the Southwick power station and the North-road works, at £100; and the tender of the Chloride Storage Battery Co. for a battery booster, at £763, has also been accepted.

Ashton-under-Lyne.—With regard to the contract for the superheaters for the above which has been obtained by W. B. Haigh and Co., of Oldham, we are informed that these superheaters will be made by T. Sugden Limited, whom Haigh and Co. represent in the Lancashire and Yorkshire district. Messrs. Sugden report recent orders for superheaters for the following corporation electricity works: Erith (repeat order), Birmingham, Plymouth, Swindon, Cardiff, and Dartford.

Maidenhead.—The Corporation have accepted the following tenders for the supply of coal to their electric power station until March 31, 1905: Graigola Merthyr Co., Cambrian-place, Swansea; G. Mattingley, Maidenhead. Also tendered: Bradbury, Son, and Co., 7 Victoria-street, S.W.; H. H. Deacon, 1, Pier Head-chambers, Cardiff; Foster and Co., 21, John-street, Adelphi, W.C.; W. Cory and Son, 52, Mark-lane, E.C.; Hinchliffe and Co., 9, Gracechurch-street, E.C.; C. T. Huxtable; Jeanes, Vrasner, and Co., Maidenhead; Plummer and Son, Maidenhead; Speakman and Sons, 138, Leadenhall-street, E.C.; Stephenson, Clarke, and Co., 4, St. Dunstan's-alley, E.C.; R. Webster and Sons, Maidenhead.

London County Council.—The Highways Committee have received the following tenders connected with the supply of 150 electric cars:

(*a*) Car Bodies.—Six tenders, as follows, were received for this work:

Hungarian Railway Carriage and Machine Works, Hungary	£58,200
Hurst, Nelson, and Co., Motherwell	63,525
Brush Electrical Engineering Co., Loughborough	74,175
United Electric Car Co., Preston	74,850
Metropolitan Amalgamated Railway Carriage and Wagon Co., Birmingham	75,375
St. Louis Car Co., U.S.A.	75,750

Note.—The lowest tenderers, the Hungarian Railway Carriage and Machine Works, did not comply with the Council's specification for the work, and, further, were not prepared to accept the Council's conditions of labour. In these circumstances, therefore, the next lowest tender—namely, that of Hurst, Nelson, and Co., amounting to £63,525—was accepted. The amount includes a sum of £1 a car body in respect of a steel underframe, and has been accepted upon condition that not less than 40 cars are delivered by Jan. 15, 1906, a further 40 by Feb. 15, a further 40 by March 15, and the balance on or before April 15, 1906.

(*b*) Trucks.—Seven tenders, as follows, were received for the maximum traction bogie trucks required for the 150 cars in question:

Hungarian Railway Carriage and Machine Works, Hungary	£13 800
Brush Electrical Engineering Co., Loughborough	14,400
Alternative tender	17,400
United Electric Car Co., Preston	14,925
Alternative tender	17,925
Hurst, Nelson, and Co., Motherwell	16,800
Mountain and Gibson, Bury	18,000
Alternative tenders	18,250 / 18,750 / 19,650
Peckham Manufacturing Co., U.S.A.	21,000
H. T. Bradford, London	24,000

Note.—The following report of the committee was adopted on Tuesday: It is of great importance that the trucks used with the electric cars should be of reliable and satisfactory design, as under the conditions now obtaining with the use of roof covers and the additional load due to the increased number of passengers thereby carried, it is very necessary that the trucks should bear without injury the increased strain thus put upon them. It has been found in the past that a very heavy item in the expenditure due to the repair of cars has been in respect of the trucks, and in these circumstances it has been necessary to examine very carefully the designs submitted by the several firms who have forwarded tenders. As the result, the tender of Mountain and Gibson, amounting to £18,000, has been accepted. Permission has been given to that firm to sublet to the undermentioned persons or firms, or to such other persons or firms as may be approved by the chief officer of tramways under the contract, the following portions of the works in connection therewith: (1) to the Hadfield Steelfoundry Co., the manufacture of the wheels; and (2) to Cammell, Laird, and Co. and to the Glasgow Engineering Co., the manufacture of the axle forgings. The tender of Mountain and Gibson has been accepted upon condition that deliveries of the work are made at the same time as the deliveries of the car bodies above referred to.

(*c*) Electrical Equipment and Assembly of Cars.—Four tenders, as follows, were received for this work, which includes the supply of special brakes:

British Westinghouse Electric and Manufacturing Co., London*	£43 300
British Thomson-Houston Co., Rugby	45 475
Dick, Kerr, and Co., London	45 550
Brush Electrical Engineering Co., Loughborough	56,050

* Accepted on the same conditions as to delivery as in the case of car bodies and the trucks. Permission has been given to the British Westinghouse Co. to sublet to A. Reyrolle and Co., or to such other person or firm as may be approved by the chief officer of the tramways under the contract, the supply of plugs for the equipments.

Nine tenders have been received for the laying of cable ducts and the supply of high and low tension cables required for the construction or reconstruction of tramways in South London, as follows:

Reid Bros., London*	£31,132	6	3
Muirhead, Greig, and Matthews, London	32,307	15	6
Westminster Construction Co., London	33,282	12	4
J. A. Ewart, London	34,276	12	7
British Insulated and Helsby Cables, Prescot	39,000	5	6
J. Mowlem and Co., London	40,380	0	0
S. Kavanagh and Co., Surbiton	41,267	2	3
J. F. Cummings and Co., London	42,812	17	8
Cunningham, Forbes, and Co., Fleet, Hants	69,712	15	6

* Accepted. Permission has been given to this firm to sublet to W. Penfold, London, or to such other person or firm as may be approved by the engineer under the contract, the casting work in connection therewith.

BUSINESS NOTES.

TRACTION.

London United Tramways Co.—The track-laying operations in Kingston are approaching completion.

Perth.—At the monthly meeting of the Town Council Councillor Macpherson gave notice of a proposal to run a Sunday service.

Birkenhead.—The Corporation have under consideration a proposal to extend the system of through tickets between the trams and the ferry.

Levenhall.—Another step towards the extension of the tramway system from Levenhall to Port Seton was carried out last week, when the necessary surveying operations were carried out.

Liege.—The British Vice-Consul reports that several lines of light railways are proposed in that district. The section from Melreux to Erezée will probably be given out for public contract towards the end of the year.

Southend.—The Town Council have decided to extend the tramways along the sea-front to Shoeburyness, a distance of about five miles. The cost is estimated at £70,000, including the continuation of the sea-wall and Marine drive.

Bournemouth.—The Branksome Urban District Council have decided to make representations to the Corporation as to an improved service. The Corporation have decided that they cannot at present entertain the suggested extension to Parkstone.

Bromley (Kent).—At a meeting of the Borough Council last week it was decided to refer to committee the question of promoting a Bill to authorise motor 'buses, as it was considered that tramways would detract from the residential character of the place.

Yarmouth.—The traffic return for four weeks in September showed the total receipts to be £2,530. 17s. 8d., the increase on the Yarmouth section being £112. 10s. The Tramways Committee have asked the Electricity Committee to grant a reduction in the charge for current.

Swindon.—The receipts for the Corporation trams for the first year total £10,227, the passengers numbered 2,862 697, the car miles were 206,266, and the traffic receipts per car mile work out at a trifle over 11½d. It is expected that a net profit will be shown. The projected extensions have been deferred.

Paisley.—It is reported that the company may shortly undertake extensions of the Potterhill and Johnstone routes. The proposals for inter-running between the company and the Glasgow Corporation appear to be hung up, chiefly because there is some difficulty as to apportioning the costs for electric power between the Paisley and Glasgow Corporations.

Falkirk.—The route work in connection with the tramway scheme is now practically completed. The new bridges across the Forth and Clyde Canal at Camelon and Bainsford are not yet completely finished, but it is expected they will be open for traffic within the next few days. Last week several satisfactory trial runs were made on the Camelon and Larbert road by the tramway company officials.

Reading.—The Corporation have appointed a sub-committee to consider the question of the desirability of obtaining powers to provide

Digitized by Google

motor omnibuses in connection with the tramways. It has been decided that the cars shall not travel at the maximum speed sanctioned, as it is stated that passengers are occasioned inconvenience through being carried beyond the stopping points.

Halifax.—Two tramcars on the Corporation electric tramways collided violently during a fog on Tuesday morning, one car having just emerged from a loop on to a single line, where the other was travelling. Both cars were badly smashed in front. The driver of one car was injured internally, and taken to the infirmary. The other driver was slightly injured. The passengers escaped practically uninjured.

Oxford.—At the meeting of the Corporation last week, the following recommendations of the Tramway Committee were adopted: (1) That Mr. Stephen Sellon be appointed to make the valuation referred to in the first portion of the memorandum; (2) that steps be taken to promote a Bill in the next session of Parliament, as suggested by Mr. Olease, containing the widest possible powers, without pledging the Council at this stage either to work or not to work the undertaking.

Chili.—The *Diario* of Aug. 17 contains the terms of a concession which has been granted to Don Ambrosio Olivos for the construction and working of an electric railway from the port of Valparaiso through the valleys of Casablanca and Curacavi to Santiago, with a branch uniting the valley of Curacavi with the town of Melipilla. This concession is for the term of 100 years from the date of the opening of the railway to the public, subject to a right of purchase by the Government at the expiration of 40 years.

Lowestoft.—At the monthly meeting of the Town Council the Tramways Committee reported that the receipts for three weeks in September were £802, against £823 in the corresponding period of last year. The engineer submitted plan and estimate of the cost of converting the single track to double from the Suffolk corner to the Hempland. The total length of track to be converted is 840 yards, and his approximate estimate, exclusive of alterations to sewers, gas, and water mains, was £1,608. Further consideration of the matter was deferred.

Gomersal.—At the meeting of the District Council it was reported that complaints were being made of the delay in the progress of the work of relaying the Gomersal, Birstall, and Dewsbury tramway by the electric traction company. The Chairman of the Council stated that he had seen the company's manager, and that in regard to the Gomersal end the company were waiting for the sanction of the London and North-Western Railway Co. to the lowering of the bridge carrying their line. It was not thought necessary, therefore, to take any action in the matter.

Electric Sprinkler.—Last week there was tried on the electric tram system in Leith a device for the sprinkling of water and the sweeping of the line. In front of the car there is fitted a perforated tube, which is supplied with water from a tank in the inside. The brushes are behind the tube, so that the ground is first watered and then swept, the dust being thrown into a receptacle. The work was effectively done, and the car proceeded at about the ordinary rate of the passenger car, so that the work can be carried out without any interruption to traffic.

Edinburgh.—A sub-committee of the Town Council had under consideration last week a proposal by the tramways company regarding the method of paying their rent as lessees of the Corporation. It is understood that the company suggests that the annual increments by which the rent rises should be increased from the stipulated sum of £2,500 to £5,000 per annum so that the maximum at the end of the lease would probably be £95 000, instead of £100,000. The proposal of the company was regarded with favour by the sub-committee, and it will be fully discussed by the Lord Provost's Committee.

Beckenham.—At the meeting of the Urban District Council the Tramways Committee reported that the solicitors to the British Electric Traction Co. and the Council had exchanged agreements for cancellation of the Beckenham tramway scheme. A letter having been received regarding the Penge tramways, in which it was stated that if current was to be available by the date specified in the agreement with the British Electric Traction Co. the necessary extensions should be proceeded with at once, the clerk was directed to communicate with the British Electric Traction Co. with a view to determining the price to be paid by them for current to be supplied by the Council.

Birmingham.—The generating station for supplying Birmingham with electric light and motive power, which for rather more than a year has been in course of erection on the site of the old General Hospital, Summer-lane, is now approaching completion. Arrangements have been made for putting in, as the first instalment, engines of 12,000 h.p., and there is provision for extensions as the demand for the electric current increases. Eight water-tube boilers of the largest construction are also being installed in the first portion of the scheme. This enormous undertaking has been rendered absolutely necessary in view of the electric tramway extension scheme and the increased public demand for illumination and motive power by electricity.

Tramways Rating.—The adjourned test case originated by the Wakefield Corporation to determine whether light railways are entitled to be assessed at one-fourth only will be held on Oct. 18. The same point has been raised at Swansea, as Wakefield and the Swansea Councils have agreed to contribute towards the cost (with other Corporations) of the test action, provided the case is contested upon circumstances precisely similar to those which obtain at Swansea. According to a Midland paper, "the British Electric Traction Co. has apparently abandoned its demand to have its lines assessed at one-fourth to the general district rate, on the ground that the track is a railway. It raised that position in letters to the Lye, Kingswinford, and other Councils, but has now paid the demands of Lye in full."

Longton.—At the meeting of the Town Council, the Improvement Committee reported that the surveyor had laid before them correspondence which had taken place with the Potteries Electric Traction Company with reference to the paving of the lower portion of Anchor-road, and the company had consented to pave the whole width of the road throughout the length of the tramway where the level was altered near to the railway bridge, and to run the gradient out to the middle of the old tramway, subject to the Corporation undertaking to pave the remainder of Anchor-road. The borough surveyor's estimate of the cost of repaving Anchor-road amounted to £3,860. The committee recommended that the tramway company's offer be accepted, that Anchor-road be repaved, and that application be made to the Local Government Board for their sanction to a loan of £3,860. The report was adopted.

Fatality.—In the Hammersmith Coroner's Court last week Mr. C. L. Drew held an inquiry with reference to the death of Theophilus Biddle. A witness stated that deceased was healthy and sober, and had good sight and hearing, although he wore glasses for reading. On August Bank Holiday deceased went out for a short walk and within an hour he was carried in again with injuries to his legs. He was at once taken in a tram to Hammersmith and removed from there on the ambulance to the hospital. On the way he said the tram had hardly stopped when he jumped off and fell under a van. He was unconscious the whole time he was in hospital, and died on Sept. 26. Eventually the jury returned a verdict of "accidental death," and added that they wished to draw the attention of the company to the advisability of having the gates kept closed whilst the trams were running between stopping places.

Cheshire Tramways Scheme.—At a meeting of the Highway Committee of the Macclesfield Town Council a letter was read from Messrs. John Newton, Sons, and Bayley, engineers, of Manchester, forwarding a sketch plan of a proposed tramway connecting Stockport, Macclesfield, Cheadle Hulme, and Wilmslow for the construction of which it is intended to seek powers during the coming parliamentary session. It was resolved that as regards the highways under the jurisdiction of the Council, consent be given authorising the construction of the above, subject to the gauge 4ft. 8½in., and to an undertaking being given that the promoters shall widen, where necessary, all the highways repairable by the Council along which the proposed tramways run, so that there shall be a minimum width of macadamised or paved roadway of 20ft., in addition to the width of the existing footpaths, and that the rails shall be laid so that there shall be 15ft. of roadway, exclusive of footpath, on one side of such rails. The minutes have been confirmed by the Council.

Harrow-road Tramways.—At the meeting of the Kensington Borough Council it was reported that letters had been received from the Harrow-road and Paddington Tramways Co. giving notice that, in the exercise of their powers under the Harrow-road and Paddington Tramway Acts, 1903 and 1904, they proposed to proceed with the work of reconstruction of the existing tramways for the electrical working of the system, and forwarding plans showing the position of the tracks, the approximate position of the tramway poles, the method of track construction, etc. The committee have given directions to the borough engineer to place himself in communication with the company, with the view of ascertaining how far it may be possible for an agreement to be arrived at for the wood paving of the portion of Harrow-road situate in this borough, and have intimated to the company that, subject to the borough engineer being able to report that a satisfactory arrangement has been arrived at, no objection will be taken to the plans as submitted.

South Staffordshire Tramways Co.—At the meeting of the Darlaston District Council the Clerk reported having written to the South Staffordshire Tramways Lessee Company with reference to the condition of the tramways. He had received a reply to the effect that the matter was receiving the fullest attention of the directors, and the managing director had recently had an interview with the town clerk of Walsall with a view to the reconstruction of the portions of the lines in that borough. Several members expressed the opinion that, as this reply was dated early in August and nothing had been done since, the position was most unsatisfactory. The Chairman said there was no doubt that the lines were now in an absolutely dangerous condition, and unless pressure were brought to bear it seemed as though nothing would be done. Mr. Robinson suggested that the Council should press for some improvement, and state plainly that in the alternative they should appeal to the Board of Trade. The Clerk explained that he had already taken this course. It was decided under these circumstances to lay the whole of the facts before the Board of Trade.

Manchester.—At Tuesday's meeting of the Tramways Committee the report was received of the sub-committee which had received a deputation from the Corporation of Ashton-under-Lyne as to the running of through trams between that town and Manchester, and a similar request was received from the Oldham Corporation. The committee came to no decision on these applications, which were reserved for further consideration. In considering the carriage of parcels by the trams, it was decided that in future the guards should be permitted to receive at any stopping station parcels up to the weight of 7lb. which bore the necessary value of the stamps issued by the Tramways Committee. The guards are not to be permitted to receive payment for carriage, nor, at present, to receive parcels the carriage of which is to be paid by the consignee. During the week ended Oct. 7 2,589,220 passengers were carried by the trams, and the total receipts amounted to £12,734. 19s. 5½d. The figures for the preceding week were: number of passengers, 2,588,649; receipts, £12,814. 10s. 3½d. The Corporation have decided to increase the number of top-covered cars, as these have been found to give excellent results.

Falkirk.—At the meeting of the Town Council an agreement with the Scottish Electric Central Power Co. was approved in regard to the supply of power for the new trams, as mentioned last week. T

Digitized by Google

terms of the agreement are as follows: "(1) The agreement to subsist for a period of 21 years from the commencement of the supply of the electric energy by my company to the tramways company, and to be subject to breaks which may be exercised by either party at the end of either 10 or 15 years on six months' previous written notice; (2) the agreement shall cover the supply of electric energy to the tramways company within any part of the existing burgh of Falkirk; (3) the sum of £100 towards the expenses incurred by the Town Council to be paid by my company to the Town Council on the execution of the formal agreement to be entered into embodying the terms of the arrangements; (4) my company to make payment to the Town Council of the sum of £30 annually, by equal portions half-yearly on May 15 and Nov. 11, the first payment (which will be made on Nov. 11, 1905) being the proportion applicable to the period from the commencement of the supply to the tramways company to that date; (5) the agreement to be entered into to bear that it is without prejudice to the rights and pleas of both parties."

King's Norton.—At the meeting of the Urban District Council the Tramway Committee submitted its report, which stated that they had effected a settlement with the City of Birmingham Tramways Co. as to the payments due to the Council under the agreement for lease of Pershore-road tramways, and as to their claim for loss of profit in consequence of the delay in opening the tramways. The committee had considered an objection raised by the company to the payment of interest and sinking fund charges on the total sum of £40,000, the amount actually borrowed by the Council by reason of the fact that the approximate capital outlay did not exceed £35 0^0. and it was finally agreed that the interest and sinking fund charges on the amount of unexpended borrowed capital should be borne by the parties in accordance with their respective interests in the tramways, the company being, therefore, called upon to pay 7½-40ths of such interest and sinking fund charges, the Council bearing the remainder. The report was adopted. The Chairman of the special committee *re* tramways stated that, in view of the erroneous ideas prevailing with regard to the date upon which the Corporation of Birmingham would commence that portion of the Moseley and King's Heath routes which lies within the city, they had ascertained that the Corporation would not commence working such routes until Dec 31, 1906. There was, therefore, plenty of time for the committee to make arrangements and to carry out negotiations. He did not apprehend the slightest difficulty with the Corporation once they had settled with the tramway company.

Belfast.—In the course of his reply to the allegations of the Belfast Citizens' Association, the city surveyor (Mr. H. A. Cutler) makes the following remarks: "With regard to the allegation that sand had been used instead of compo, I do not for a moment believe that such a thing has occurred, except where it is specified for such to be used. The loose paving does occur in several places; but, considering the magnitude of the job, and the heavy loads drawn by traction engines which have passed over the new work, I consider the amount of loose paving to be relatively small. Wherever loose paving shows itself Messrs. White will have it put in proper condition before the period of maintenance has expired, whether it arises from bad work or any other cause. With regard to the complaint of the association that setts wider than specified have been allowed at places specifically mentioned, on the Cramlin and Shankhill roads, it is rather unfortunate for their argument that the setts which are said to be in accordance with the specification are the new ones supplied by Messrs. White, and those which are larger, with the exception of five yards, are setts which were taken up from the old tramways and reused. I might have been considered to have performed my duties more faithfully, and have avoided the complaint of the Citizens' Association, had I had all the old setts dressed down to 3in. and 3½in., although such is not required by the contract; but this I could not have done without feeling that I had robbed the ratepayers of the value of 25 per cent. of all the old setts, which would amount to £16,000. All the other points drawn attention to by the association were answered in my report on Councillor Gregg's letter of Sept. 4, but the assertion that the setts on the Shore-road were condemned in consequence of my attention having been drawn to the matter from outside sources is totally incorrect. I condemned the setts as soon as I saw them. They were only parts of shipments delivered and condemned in other parts of the city."

London County Council.—At the reopening meeting of the Council on Tuesday the Highways Committee recommended that authority be sought in the session of Parliament of 1906 to enable the Council to construct new tramways as follows: (1) from the Plough, Clapham (London County Council tramways), *via* Clapham Common north side and Cedars-road, to Lavender-hill (London County Council tramways); (2) from Seven Sisters-road (existing tramways), *via* Amhurst-park, to Upper Clapton-road (existing tramways); (3) from Aldgate (existing lines), *via* the Tower Bridge northern approach, to a point near the Tower Bridge; (4) from the Lea Bridge-road terminus (existing tramways), *via* Lea Bridge-road, to Upper Clapton-road (existing tramways); (5) from Tooting-broadway (London County Council tramways), *via* Mitcham-road, to the county boundary near Tooting Junction railway station; (6) from High street, Streatham (London County Council tramways terminus), *via* Streatham High-road, to the county boundary at Norbury, with do n line *via* Gleneldon-road, Bournvale-road, and Stanthorpe-road; (7) from near the Marble Arch, *via* Edgware-road, Maida-vale, and High-road, Kilburn, to the county boundary at Cricklewood. This was postponed. The Board of Trade have certified as ready for traffic the short extensions from the Tooting terminus along Tooting High-street and Defoe-road. The circular steamboat and tram tickets proved so popular that it was decided to extend the scheme. The Board of Trade have approved the conduit system for the subway from the Strand to Theobald's-road. Permission has been granted to the National Telephone Co. to use for its works a 6in. space along the subways in course of construction, the company paying rent according to the scale laid down in the Council's by-laws. At the meeting of the Court of Common Council on Monday Mr. John Harris asked that, at the conference of the Bridge House Estates Committee with the London County Council on the subject of tramways across the Thames, it should be suggested to the London County Council that they should form a new street on the south side of the Thames, between Westminster and Blackfriars Bridges, and by means of a tunnel. or otherwise, provide direct communication between the trams from Kingsway and the South London trams. Mr. Algar, replying for the committee, said they had been invited to consult with the London County Council, and would carefully consider any proposal the London County Council might put forward. The Works Committee of the Stepney Borough Council reported on Saturday that they had considered an important letter from the London County Council with reference to the forthcoming electrification of the tramways in the East of London. The London County Council pointed out that, owing to the nearness of the Whitechapel and Bow Railway to the surface of the roadway, it was practically impossible to adopt the conduit system, and that therefore in Mile End-road and other thoroughfares they proposed to use the overhead system. The letter also stated that the Poplar Borough Council had agreed to the adoption of the overhead system, and suggested that, with the view to expediting the electrification, the Stepney Council should take the same course. The Works Committee, however, in their report point out that at only two places does the Whitechapel and Bow Railway present difficulties, and that it would not be difficult to overcome these. While in favour of doing all they can to expedite the electrification, they advise the Borough Council not to depart from their previous decision against the use of the overhead system in the borough. For the fourth time the County Council, preparatory to seeking parliamentary powers, have asked Paddington whether it is prepared to contribute a third of £60,350, which is the estimated cost of widening Edgware-road, so as to permit electric tramways from the Marble Arch to Cricklewood. The General Purposes Committee of the Borough Council recommend that the central authority be again informed that Paddington is prepared to consider the tramway scheme if the County Council bear the total expense of road widening "as part of their tramway policy." At the meeting of the St. Marylebone Borough Council, the General Purposes Committee had on the agenda a report that it has had under consideration a letter from the County Council suggesting the widening of Edgware-road, High-road, Kilburn, and Shoot-up-hill, in connection with the proposal to construct a tramway from the Marble Arch to Cricklewood, and asking whether, in the event of the County Council resolving to undertake the work, the Borough Council will give consent to the construction of a tramway along the portion of the route within the borough of St. Marylebone. The committee states that the estimated total net cost of the street widenings contemplated by the scheme is £94 000, and recommends the Council to consent to the construction of the proposed tramway, provided the Council be not asked to incur any expense for any street widenings necessitated. A deputation of members of the Highways Committee of the London County Council attended at the Guildhall on Wednesday to confer with the Bridge House Estates Committee on the question of some legislative co-operation between the Council and the Corporation with refererence to running tramways over Blackfriars Bridge and along the Victoria embankment. The question was discussed generally in private but it is understood that no definite scheme was formulated. Subsequently the whole question was adjourned until Monday, when the Bridge House Estates Committee will meet for the purpose of submitting definite recommendations to the Court of Common Council. The Stepney Borough Council have decided that they cannot consent to the use of the overhead system.

LIGHTING AND GENERAL.

Canterbury.—The electrical engineer has been deputed to visit the Olympia Exhibition.

Bath.—The question of lighting the new Midland bridge by electricity is being investigated.

Worthing.—Sanction has been received to the borrowing of £3,300 for electric lighting purposes.

Irvine.—The proposed electric lighting scheme has been deferred owing to opposition by the ratepayers.

Rochdale.—The Town Council are about to apply for powers to borrow £42,405 to pay for extensions at the electricity works.

Dewsbury.—The General Works Committee have received five tenders for the supply and erection of a new refuse destructor.

Hamilton.—Cables are now being laid into the pipes provided for the underground telegraph system between London and Glasgow.

Berwick.—Sir Hubert E. H. Jerningham, K.C.M.G., on Tuesday opened an electrical exhibition at Berwick before a large company.

Birkenhead.—Two members of the Electricity Committee, together with the engineer, have been deputed to visit the Olympia Exhibition.

Llangollen.—The Council have decided to postpone the adoption of the electric light for the whole of the town. Further investigations are to be made.

Sunderland.—The County Borough Council propose to place eight arc lamps on the concrete balustrade of the Roker promenade at an estimated cost of £504.

Removal.—Messrs. James Willing, jun., newspaper advertisement contractors, have removed their West-end branch from Piccadilly to 73, Knightsbridge, London, S.W.

Bromley.—The supplemental agreement with the National Telephone Co. relating to the proposed underground work in Tweedy-road and College-road has been approved.

Digitized by Google

Sunningdale.—The Parish Council are considering a proposal from an electric light company in London who desire to supply the parish with electricity for lighting purposes.

Frimley.—The Urban District Council have referred to the Lighting Committee the question of sanctioning the proposed electric lighting order of the Camberley Electric Supply Co.

Eastwood.—The Urban District Council have decided to adopt public electric lighting providing favourable terms can be arranged with the Notts and Derbyshire Electric Power Co.

Hull.—Arrangements are to be at once made for reinstalling the National Telephone system to the Humber Pilotage Commissioners' office and the Alexandra Dock at an inclusive annual rental.

Widnes.—A sub-committee has been empowered to take the necessary steps for obtaining further powers of transfer to the Mersey Electric Supply Co., the term authorised having expired Aug. 15.

London County Council.—On Tuesday it was agreed to lend the Islington Borough Council £13 000 for electric lighting and the Woolwich Borough Council £10 223 for electric lighting purposes.

New Firm.—The firm of James E. Sayers, 157 West George-street, Glasgow, consulting engineer, has been changed into James E. Sayers and Caldwell, by the admission of Mr. James Caldwell to the firm.

St. Pancras.—The Borough Council are fitting up 5, Camden-road for showroom purposes for the electricity department. On Wednesday an extension of arc lighting (Section D) at a cost of £8,250 was approved.

Yarmouth.—The borough surveyor has been instructed to proceed with the work of electric lighting of the Marine-parade, Gorleston, and neighbourhood, by means of 10 arc lamps, at a total outlay of £57. 10s. per annum.

Brighton.—The Lighting Committee have been requested to attend the electrical exhibition at Olympia, and other members of the Council will be invited to accompany them. The expenses of the members attending are to be paid by the Council.

Battersea.—Electric mains are to be extended to Heathfield House at an estimated cost of £550. The subway recently formed by the Council between Latchmere-road and Cabul-road is to be lighted by means of Nernst lamps at an estimated cost of £70.

Hereford.—The Town Council intend to apply for sanction to borrow £5 300 for cable extensions, supplementary feeders, purchase of electric motors for hiring out, etc. The annual revenue from the extensions for lighting is estimated at £492.

Nernst Electric Lamps.—The A.E.G. English Manufacturing Co., 4 and 5, New Compton-street, Charing Cross-road, W.C., inform us that they have taken over the business of the Nernst Electric Light, and are now doing the export as well as the home trade.

Anglo American Telegraph Co.—The directors have resolved, after placing £5,000 to credit of renewal fund, to declare an interim dividend for the quarter ended Sept. 30, 1905, of 15s. per cent. on the ordinary stock, and £1. 10s. per cent. on the preferred stock.

Taunton.—At the last meeting of the Town Council a motion that the Council request the Electric Lighting Committee to revise its charges to private consumers so as to meet present and future liabilities was defeated by a large majority, only three voting in its favour.

Partnership.—Mr. James E. Sayers has taken Mr. James Caldwell, formerly his assistant, into partnership. The new firm will practice as consulting engineers and electricians at 157, West George-street, Glasgow, under the name of James E. Sayers and Caldwell.

Middlesbrough.—The electrical engineer (Mr. Taylor) in his last report states that the extensions to the plant are practically complete. During the month 150,000 units were sold as against 58,000 in the corresponding period of last year. The profit for the month amounted to £586.

Cheltenham.—It has been decided to provide a spare motor-driven pump at the station. It appears that a very large demand for power for traction is now compelling the Council to work their plant almost to its utmost capacity. The cost, estimated at £154, is to be met out of current revenue.

Market Harborough.—The Urban District Council have decided to proceed at once to take the necessary steps to obtain power for the establishment of an electrical supply within the urban district during the next session of Parliament. Messrs. Rees and Freres will act as their parliamentary agents in the matter.

Bolton.—At the last Town Council meeting a long discussion arose upon the decision of the Electricity Committee that it was inadvisable to allow the Co-operative Society to lay an underground electric cable from their premises in Bridge-street to those in Bark-street. An amendment to refer the matter back was lost.

Camberwell.—Notices having been received from the County of London Electric Supply Co. of intention to lay electrical conduits along both sides of Wagner-street, St. James's-road, and Olmar-road, the Council have decided to reply that they have no objection to the laying of the mains proposed, subject to such mains being used solely for the purpose of supplying electricity within the borough.

Croydon.—The Post Office have notified their willingness to establish telephone exchanges at Purley and Kenley. They also proposed to erect overhead wires in a number of streets. The District Council have been recommended to oppose all overhead wires, and arrange the best terms they could with the Post Office.

Morley.—Mr. J. E. Ellis, the borough electrical engineer, in his last report states that the total output from the electricity works during the month of August was 7,181 units, against 7,925 the same month last year, and that there had been 4,664 units sold to consumers by meter, against 3,616. There had been 275 lamps connected during the month, the total number of lamps to date being 13,001.

Louth.—The application of the Town Council for sanction to borrow £17,000 for the purposes of electric lighting has been refused. The Council think satisfactory arrangements may be made with a private company, and, in that case, would apply to the Local Government Board for leave to transfer the order. With that object in view application will be made for an extension of the time limit of the order.

Lowestoft.—The last report of the resident engineer states that during the month nine new consumers have been connected to the mains, representing 785 8-c.p. lamps. One 35-h.p. motor has been connected during the month. There are now connected to the mains 652 consumers, representing 33,195 8-c.p. lamps. The question of reducing the charges for power for tramways will come before the next meeting of the Electric Lighting Committee.

London Gazette.—The partnership between Edwin C. Wallis and E. H. Watson, electrical engineers, 36, Trinity-street, Leeds, has been dissolved by mutual consent. A receiving order has been made out on debtors' petition in the estate of George Robson and John Samson Robson, electrical engineer, Empire-buildings, Newgate-street, Newcastle-on-Tyne. The first meeting will be held at the Official Receiver's Office, 30, Mosley-street, Newcastle-on-Tyne, on Oct. 14, at 11 a.m.

Stock Exchange.—The Stock Exchange Committee have appointed Oct. 18 special settling day for the Newcastle and District Electric Lighting Co.'s £150,000 4½ per cent. mortgage debenture stock, and have ordered the said securities to be quoted in the official list. The committee have been asked to allow the following securities to be quoted in the official list: County of Durham Electric Power Distribution Co.'s 20,000 5 per cent. preference shares of £5 each, fully paid, Nos. 1 to 20,000; Electric Supply Corporation's £50,000 4½ per cent. debenture stock.

Edinburgh.—The Town Council have received a report from the Electric Lighting Committee recommending that condensing plant should be provided at Dewar-place station at a probable cost of £13 0 0, and at McDonald-road station at a probable cost of £28 500; and that authority be granted to make arrangements with the North British Railway Co. to take water from the Union Canal for condensing at Dewar-place station; and that provision be made in the Bill which is to be promoted in Parliament for powers to take water from the Water of Leith for the McDonald-road station.

St. Marylebone.—The Electric Supply Committee reported at the meeting of the Borough Council last night that the number of consumers now being supplied from the Council's electricity generating station was approximately 4,000. With regard to supply in bulk, the committee state that owing to the fact that the supply to large areas have been taken over from the company, and that (owing to the delay consequent on the Board of Trade inquiry *re* the change of pressures) in the case of some of the consumers the supply is necessarily at the old voltage, whereby a considerable proportion of electric energy is wasted, the load required to be provided for at the Council's generating station is heavier than had been estimated (the engineer having reckoned on larger areas being changed over to the higher voltage) and they have considered it advisable to approach the company with a view to obtaining the benefit of the option of a supply of electricity in bulk from them in case the same may be required during the next few months, by which time the critical period will be passed, as a larger number of consumers will then be changed over to the higher voltage. They are according negotiating with the company for such a supply in bulk, which the company are bound to give to the Council, on terms to be agreed, under the heads of agreement of May 8, 1901. The committee have provisionally arranged the following tariff—viz.: ordinary lighting purposes, 8d. per unit for 500 hours' supply on maximum demand and 1d. per unit afterwards; basement lighting, 2d. per unit; and for power purposes, 2d. per unit for 500 hours' supply on maximum demand, and 1d. per unit afterwards.

Tantalum Lamps.—Experience with a large number of these lamps has shown that when used on alternating-current circuits the results are not so good as on continuous-current circuits, the life of the lamp frequently being considerably shortened and the globe showing a tendency to blacken. We are informed by Messrs. Siemens Bros. and Co. that they recommend, for the present, that the use of tantalum lamps should be restricted as far as possible to continuous-current circuits. They further say that experience has shown that on continuous-current circuits the useful life may be assumed, generally, as being between 400 and 600 hours, and in many cases it is actually even larger, whilst the total life often greatly exceeds 1,000 hours. The candle-powers of the lamps of various voltages are proportional to the standard candle-power of the 110-volt lamp (23 British candle-power). Messrs. Siemens have had many inquiries as to why they do not put the 110-volt lamp on the market with a candle-power somewhere about 16, the general opinion being that 23 c.p. was too high for most requirements, although the current consumed is actually less than for the carbon filament of the lamp of 16 c.p. They say that, according to present manufacturing arrangements, in order to reduce the candle-power it is necessary to have a lower voltage lamp so as to secure the same high efficiency, and that they are now prepared to accept orders for 2·2-watt lamps for pressures of 50, 55, 60, 65, 73-75, 100, and 110 volts. These lamps have a useful life of about double the duration of the lamps described above, and give 30 to 40 per cent. less light, with an efficiency at starting of 2·2 to 2·4 watts per candle-power. For instance, the 110-volt lamp of this type gives a light of about 14½ c.p. with an efficiency of 2·2 watts per candle-power. Its useful life is about 800 to 1,000 hours, and the total life often reaches 1,500 to 2,000 hours. With the efficiency mentioned, a lamp having such a long useful life is a great improvement on anything that has been done in connection with carbon-filament lamps.

Digitized by Google

Wimbledon.—An inquiry has been held into an application for sanction to borrow £5 000 for the purposes of electric lighting capital expenditure during the 12 months ending March 31, 1906, made up as follows: mains and pilot wires, £3,000; meters, £600; transformers and sub-stations, £1,190; contingencies, £210. Mr. Lee, the engineer, stated that the present power was inadequate, and in the event of a breakdown they would be placed in a very difficult position.

Colchester.—The electrical engineer's last report states that the output of electricity during August, 1905, was 32,945 units for lighting, against 27,000 in 1904 and 19,099 in 1903, and for traction 36,566, against 38,444 in 1904. The number of consumers at end of August was 757, against 529 in 1904 and 370 in 1903. The total number of 8-c.p. lamps connected was 34,212, against 26,728 in 1904 and 23,206 in 1903. New mains are to be laid at an estimated cost of £185.

Oulton Broad.—The Oulton Broad Electricity Co. have offered to take over the Reason lamps on the understanding that, should the Council terminate the lighting contract within three years, the Council should take back the lamps at their original cost. The Council have suggested the following terms: that if the company carried on the lighting for one year, the Council should pay two-thirds of the cost of the lamps; if for two years, one-third; and if for three years, the cost to be borne by the company, and that no additional annual payment be made.

Chester-le-Street.—The County of Durham Electric Power Supply Co. last week renewed their application to the Rural District Council for consent to an application for the carrying of overhead mains, and pointed out that the two companies are in reality one financial interest, but have separate statutory powers, and the Board of Trade preferred separate consents. The letter also stated that offices had been taken in Chester-le-Street, and land obtained on which to erect a power station. Notice of motion to rescind the former refusal has been given so that the main question can be discussed.

City of London.—Last week a report from the Streets Committee was submitted with reference to a letter received from the City of London Electric Lighting Co. in reply to a notice from the Corporation to remove their electric lamps from Queen Victoria-street, Fleet-street, Monument-street, and part of Lower Thames-street. The committee reported that they had informed the company that they saw no reason to recommend the Corporation to vary the decision arrived at on May 4 in regard to the lighting of the thoroughfares in question by means of incandescent gas. This was agreed to.

Beckenham.—The cost of laying a cable to supply Wickham Hall would be £225, in addition to which the station cost would amount to £15. The probable number of units to be used is 10 000 per annum. This matter is being held over. Extensions amounting to £210 are to be made. In accordance with the provisions of the contract for the working of the Beckenham electric lighting station, the engineers therein named—viz., Messrs. R. P. Wilson and J. A. Angell—are about to make an inspection of the whole of the premises, dust destructor, plant, machinery, and apparatus, and report thereon to the Council.

Rothwell.—At the last meeting of the Council a resolution was carried appointing a deputation to meet the directors of the gas company, with a view to the purchase of their undertaking by the Council. During the discussion it was stated that the Wakefield Tramway Co. was prepared to supply electricity in bulk. It was also suggested that the West Riding County Council be asked to further a project by parliamentary permission, whereby all electrical current, etc., shall be supplied by the County Council to the district councils, so as to secure for the ratepayers all the advantages and profits now enjoyed by private companies.

Poplar.—The Visiting Committee of the Poplar and Stepney Sick Asylum Board reported at the last meeting that they had considered the question of engaging firms to execute the engineering and electrical repairs of the institution, and whether it would not be advisable for the managers to engage their own workmen for the carrying out of the repairs in question. The cost of the work for the preceding year was £772. 14s. 5d. The committee recommended that the Board employ its own workmen to carry out the engineering repairs at the institution. The materials and labour for the year ended Midsummer, 1905, for electrical repairs cost £234. 1s. 6d. It was decided that, when necessary, the Board employ its own workmen to carry out the electrical repairs which may require to be done in the institution.

Dundee.—With regard to the recent failure of the electric light supply, we have received the following report. On the night of Oct. 5, owing to a failure of one of the lead-covered cables in one of the outlying districts, which were laid a few years ago, a bad fire was started in one of the manhole boxes in Scouringburn, threatening to ignite the adjacent buildings. It being impossible to disconnect this length of cable during such a heavy short-circuit in the old type of disconnecting boxes, owing to their small size and being in such deep manholes, it was absolutely necessary to shut down a large part of the town at the station for a few minutes to allow of the disconnection of the faulty length. The fault was not due to bad cables, the same being perfectly good British Insulated Wire paper cables in good condition, but was due to the way the cables were laid.

Kensington.—A notice has been received from the Notting Hill Electric Lighting Co. relative to proposed extensions of their mains in Ladbroke-road, but the Council are not prepared to grant permission for the carrying out of the proposed works, inasmuch as the plan shows a crossing of the roadway which might, they think, be avoided by the laying of a main on the south side of the road. With regard to a notice received from the Kensington and Knightsbridge Electric Lighting Co. relative to proposed extensions of their mains in Palace-gate, the Council had previously refused to grant permission for the carrying out of these works for a similar reason. On learning, however, that the mains referred to were to be laid in connection with the erection of certain trial lamps for public lighting, and that the roadway crossing shown on the company's plan was necessary in order to avoid the duplication of mains in the grouping of the proposed lamps on the one circuit, permission has been given on the usual conditions.

Birmingham.—It is expected that the electricity station in Summer-lane will be in full working order before the end of this year. At present plant of 12,000 h.p. will be installed, and arrangements have been made to allow of extensions when required. The site of the new station covers 4½ acres. Seven high-speed enclosed steam-engines, fitted with condensers, are in course of erection—four are of 2,500 h.p. each and three of 800 h.p. each. The British Westinghouse Electric and Manufacturing Co. are supplying three-phase generating plant of an aggregate capacity of 3,000 kw. This will consist of one 1,500-kw. rotating-field 25-period 5,600-volt generator, running at 166⅔ r.p.m., and three similar machines of 500 kw. each, running at 250 r.p.m. An electrically-driven crane of a lifting capacity of 40 tons has been fixed, which will come in useful during the erection of the engines and dynamos. There will be eight water-tube boilers, the largest of which will be capable of evaporating 24,000lb. per hour. Coal-bunkers capable of containing 2,000 tons will be served by bucket conveyors, which on their return journey will carry away the refuse from the boiler fires.

Sutton.—At the recent enquiry it was stated that the number of the electric light consumers had increased from 51 in 1901 to 403 at the present date. The output for the 15 months ending March, 1903, was 56,710 units, and for the 12 months ending March, 1905, 156,602. For the current year the output was estimated at 220,000. The deficiency for the 15 months ending March, 1903, was £1,727, as compared with £690 for the 12 months ending March, 1905. No deficiency at all is anticipated on the current year, as the revenue is increasing and the working cost decreasing. The total expenditure to date is approximately £38,500, and the amount raised by loan £31,208. The deficits have been met each year by a call upon the district fund. The current is supplied to private consumers on a sliding scale of from 5½d. per unit for less than 400 units per annum down to 4d. per unit for over 4,000 units per annum. For power or heating purposes the price is 2d. per unit. The cost of public electric lighting, including labour, capital, and maintenance charges, works out at 1·4d. per unit, including the 14 arc lamps, for which £13. 10s. each was charged per annum, as against 1s. 1d. per 1,000ft. (or 18s. to 20s. per lamp per annum) for gas.

Aston.—An inquiry has been held into an application of the Borough Council for sanction to borrow £50,000 for extensions of their electric power station and plant. The original loan obtained by the Council in 1902 for the purposes of erecting the electrical station was £52,435. This sum, however, has been exceeded by £20,000, mostly on account of the necessity of laying new feeders in various parts of the borough owing to the rapidity with which the current supply was taken up. A sum of £5,362 was spent in the purchase of free wiring and motors. In addition to this sum of £20,000, the Council require £30,000 for the extension of the power station and plant, rendered necessary by means of the increasing demand for the supply of electricity. It was stated at the inquiry that on March 31, 1904, the number of consumers was 237, representing 16,190 8-c.p. lamps. In March, 1905, there were 349 consumers, equivalent to 33 219 8 c.p. lamps. At the present date there were 364 consumers connected, equivalent to 40,440 8-c.p. lamps, or an increase during the six months ending Sept. 30, 1905, at the rate of 44 per cent. The current sent out for all purposes for the 12 months ending March 31, 1905, was 1,049,653 units, and it was estimated that for the year ending March, 1906, there would be an output of a million and a half units. It was anticipated that the undertaking would be self-supporting within the next two years.

Dartford.—The accounts of the electricity undertaking for the year ending March 31 show a working profit of £598. Capital charges for principal and interest amount to £1,873, so that a sum of over £1,270 has to be provided from the rates. Of this £1,873 of capital charges, £861 represents repayment of capital, but no provision is shown in the account for depreciation of plant. The capital indebtedness stood at a total of £37 800 on March 31 last, showing an increase in the 12 months of £3,088. The total revenue was £3,556. Sales of current amounted to £3,284, including £1,033 for public lighting. The expenditure was as follows: coal, £1,120; oil, water, and stores, £201; wages and generating station, £385; repairs and maintenance, £252; repairs and maintenance of distribution in the town £146; repairs and renewals to public lamps, £312; and management expenses £355, making a total of £2,958. The deficiency in the preceding year was £2,316, or nearly double that of this year. The improvement is due to the expansion of income from £2 388 in 1903-4 to £3 556 in 1904 5, whilst the expenditure had remained about the same in the two years, being respectively 1903 4, £2,817; 1904-5, £2,958. Mr. J. D. Pember, the electrical engineer, in his report refers to the lack of a motor load, and says that, although there are 120 h.p. of motors connected to the mains, the demand for power is so remarkably intermittent that a 10-h.p. motor, if running for nine hours per day per 300 days per annum at or about full load, would take as much current a year as the whole of the motors now supplied. Another difficulty arises from the number of small lighting consumers, especially sub-meter consumers, whose average receipts per yard of main laid for them come out very low. The capital expenditure also is high for the present output. The engineer considers that the rates of the capital expenditure per unit sold would be almost halved when the trams were supplied, owing to the greatly increased output of the station and the small addition of capital expenditure necessary. As much as 6½ times as many units could have been sold in the year ended March, 1905, if the maximum load had continued day and night all through the year.

PROVISIONAL PATENTS, 1905.

Oct. 2.

19853. Improvements in electrical secondary batteries for propulsion. Walter Nathaniel Caton, The Hill, Bakewell, Derbyshire.

19865. Improvements in apparatus for producing unidirectional high-potential electric discharges for the dispersion of fog and for other purposes. Ernest Wilson and William Hamilton Wilson, 64, St John's-park, Blackheath, London.

19866. Electromobile, with charging plant combined. Peter Kopp, 41, Grosvenor-mews, New Bond-street, London.

19867. Improvements in and relating to telephones. André Gabeaud, 2, Boulevard Beaumarchais, Paris, France.

19889. Improvements relating to alternating-current motors. Robert Lundell, 7, Southampton-buildings, Chancery-lane, London. (Complete specification.)

19906. Improvements in electric clocks and clock systems. Isaac Hardy Parsons and Alfred Ernest Joseph Ball, 40, St. Saviour's-road East, Leicester.

Oct. 3.

14660A. Improvements in and relating to vapour electric rectifiers and lamps for alternating current. Francis Harrison, 14, Ossian-road, Stroud Green, London. (Date applied for under Rule 5 of the Patents Rules 1905, July 17, 1905.)

14660B. Improvements in apparatus for heating and in mercury vapour electric lamps used therein. Francis Harrison, 14, Ossian-road, Stroud Green, London. (Date applied for under Rule 5 of the Patents Rules, 1905, July 17, 1905).

19937. Improvements in and relating to electric arc lamps. Crompton and Co., Limited, and Charles Franklin Tubbs, 55, Chancery-lane, London.

19967. Improved construction of insulator device for connecting electric lamps to their supports. Louis Carl Henry Mensing and Bruce Peebles and Co., Limited, 173, Fleet-street, London.

19968. Improved construction of electric switch. Louis Carl Henry Mensing and Bruce Peebles and Co., Limited, 173, Fleet-street, London.

19969. Improved combination of case or holder for electric resistance coils. Louis Carl Henry Mensing and Bruce Peebles and Co., Limited, 173, Fleet-street, London.

19978. Improvements in and relating to electromagnetic separators. William Blackmore, 18, Southampton-buildings, Chancery-lane, London.

19989. Improvements in apparatus for electrically opening and closing railway carriage or like doors and for operating locks in connection therewith. Alfred Craven, Palace-chambers, Westminster, London. (Complete specification.)

19992. Improvements in switches for intercommunicating and central-station telephones. Bernard Hahner, 6, Lord-street, Liverpool. (Bernard Hahner, England.)

Oct. 4.

20024. Improvements in electro-deposition apparatus. Albert Frederick Harris, Prudential-buildings, Corporation-street, Birmingham.

20040. Improvements connected with railway and tramway points operated by or from the vehicles and with points or switches for use in or upon the overhead equipments of electric railways and tramways furnished with points. John Wild, 288, Hollins-road, Hollinwood, Oldham, Lancs.

20051. Improvements in automatic transmitters for electric fire-alarms or other signals. Harold Hawthorn, 79, Fenchurch-street, London.

20058. Improvements in mounting the field coils of dynamo-electric machines. Siemens-Schuckertwerke G. m. b. H., 12, Queen Anne's-gate, Westminster, London. (Date applied for under Patents Act, 1901, Nov. 12, 1904, being date of application in Germany.) (Complete specification.)

20068. Improvements in receiving systems for wireless transmission of signals. Valdemar Poulsen, 7, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 8, 1904, being date of application in Denmark.) (Complete specification.)

20069. Improvements in or relating to electric alternating-current switches. Charles William Scott Crawley, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

20100. Improvements in or relating to Rontgen-ray tubes. "Polyphos" Elektrizitäts-Gesellschaft, 31, Bedford-street, Strand, London. (Date applied for under Patents Act, 1901, Oct. 5, 1904, being date of application in Germany.) (Complete specification.)

20102. Improvements in electric carrier systems. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

Oct. 5.

20104. Improvements in or connection with brushes for electrical machines especially adapted for turbo-generators. John Conrad Bedford Ingleby, 30, Park-row, Leeds.

20106. High-tension distributor for electric ignition of internal-combustion engines of more than one cylinder which is worked by one induction coil. Harry John Simmons, 12, Gartmoor-gardens, Wimbledon Park-road, London.

20143. Improvements in electric batteries or accumulators. Douglas Hamilton Whitehead and Quinton Marinon, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

20152. Improved electric ship log and indicator. Egbert Vincent Hector Rizzo, 9, Warwick-court, Gray's-inn, London.

20155. An automatic device for use in conjunction with the automatic control of electric arc and incandescent lighting circuits. Charles Frederick Trippe and Charles Norman Staniland, 71, Queen Victoria-street, London.

20158. An improved electric switch. Alan Wright, 33, Cannon-street, London.

20169. Improvements relating to systems of electrical distribution. Rudolf Braun, The Westinghouse Patent Bureau, Westinghouse-building, Norfolk-street, Strand, London.

20175. Improvements relating to the manufacture of incandescing bodies for electric incandescent lamps. Alexander Just, Franz Hausman, Heinrich Landesberger, Ignaz Salzmann, and Vereinigte Electricitäts Actien-Gesellschaft, 7, Southampton-buildings, Chancery-lane, London. (Complete specification.)

20184. Improved electrically-operated displaying mechanism for advertisements and the like. Harry Sanders Woodyer and William Edgar Woodyer, 322, High Holborn, London.

Oct. 6.

20197. Improvements in and appertaining to the making of talking machine "records" by means of electricity. Malcolm Macnaughton Robertson and James Leo Parry, 9, Tempest Hey, Liverpool.

20217. Improvements in apparatus for the electrolysis of water. Karl Joseph Vareille, 6, Bank-street, Manchester. (Complete specification.)

20231. Improvements in and connected with buzzers or sounders for telephone stations. Hermann Oppenheimer, 55, Redcross-street, Barbican, London. (Akt.-Ges. Mix und Genest, Germany.)

Oct. 7.

11036A. Improvements in alternating-current measuring instruments. Frank Conrad and William Maple Bradshaw, The Westinghouse Patent Bureau, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, May 27, 1904, being date of application in United States. An invention comprised in application No. 11,036, May 26, 1905.) (Complete specification.)

11036B. Improvements in alternating-current measuring instruments. Frank Conrad and William Maple Bradshaw, The Westinghouse Patent Bureau, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, May 27, 1904, being date of application in United States. An invention comprised in application No. 11,036, May 26, 1905.) (Complete specification.)

20269. Electric mains telephone and fault detector, for use on continuous-current mains of electric light system. Ivan Arthur Carr, 38, Northbourne-avenue, Morpeth.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Oct. 26.

1904.

20968. Central-station electric installations. Highfield.

21142. Variable-speed mechanisms. Carolan. (General Electric Company.)

24022. Recording instruments. Edgcumbe and Everett.

24605. Wattmeters. Sumpner.

25478. Electric fuse-boxes, single and double pole. James.

25729. Dynamo-electric machines. British Thomson-Houston Company, Limited. (General Electric Company.)

26082. Dynamo-electric generators. Leitner and Lucas.

26171. Armature windings for dynamo-electric machines. British Thomson-Houston Company, Limited. (General Electric Company.)

26288. Electrical apparatus for training and elevating heavy guns. Vickers, Sons, and Maxim, Limited, Williamson, and Sumpter.

26327. Electric switches. Large.

26374. Automatic electric switches, particularly for use in charging electric accumulators. Leitner, Lucas, and Hill.

26445. Brushes for dynamo-electric machines. Feeny. (Wirt.)

26662. Apparatus for the production of reactions in gases by means of electric arcs. Johnson. (Badische Anilin und Soda Fabrik.)

1905.

269. Electromagnetically controlled fluid pressure motors. Malan.

1136. Electrical condensers. Rymer-Jones.

1732. Controller and brake mechanism for electrically-driven road vehicles. Russell and Ford.

2631. Ships' telegraphs. Lynch.

2890. Apparatus for electrically operating gas-valves. Scott.

3076. Electric signalling apparatus. Evershed and Vignoles, Limited, and Evershed.

3265. Electrical switches. Tyer.

5866. Electrically-operated tubes or bulbs containing rarefied gas or vapour. Howorth. (Moore Electrical Company.)

6053. Electric lamps for illuminating timepieces and for other uses. Vickery.

8127. Gasproof and disconnecting plug for electrical switches. Carter.

12466. Telephone mouthpieces Knoll.

13093. Electric drills. Boult. (Duntley).

13586. Method of and means for supplying current to branch stations of telephone exchanges. Siemens Bros. and Co., Limited. (Siemens und Halske Akt.-Ges.)

14210. Regulating switch apparatus for increasing or decreasing the pressure of a network in finely-divided stages. Siemens Bros. and Co., Limited. (Siemens-Schuckertwerke, G. m. b. H.)

14700. Apparatus for electric welding. Lake. (Clinton Wire Cloth Company.)

* Including steam trains. † And 98 miles of interlacing track. a Train mile. b Per mile of single track. h Half-year's figures.

Digitized by Google

NOTES.

Books Received. — "Theorie der Elektrizitaet" (vol. ii., "Elektromagnetische Theorie der Strahlung"), by Dr. M. Abraham. B. G. Teubner, Leipzig. 10s.

Wireless Telegraphy.—The s s. "Inkosi," of Messrs. John T. Rennie, Son, and Co.'s Aberdeen line, has just been fitted with the Marconi system of wireless telegraphy, and the s.s. "Inanda," of the same line, will be similarly fitted before she leaves on her next voyage to Africa. These are the first passenger steamers going into southern latitudes to be so fitted, but at present it will only be possible for communication to be kept up as far as Las Palmas, except when they are in touch with his Majesty's ships at sea, or at Simon's Bay.

Electricity for Pottery. — The question of the utilisation of electricity in the potteries is at present engaging the attention of potters, and under the auspices of the Ceramic Society a meeting was held in Stoke on Saturday last for the purpose of a lecture by Mr. Axel Odelberg on experiments made in Sweden in the working of potters' machinery by electricity. Mr. Odelberg is connected with the Gustafsberg Pottery, near Stockholm, and the results of his experiments with electrical power, which at first were on a small scale, and were gradually increased, went to show that, as compared with steam, electricity is cheaper, handier, and quite as efficient.

London's Electric Supply.—In our previous week's issue we called attention to the possibility of the London County Council undertaking supply of electricity in bulk. The borough councils are moving in the matter, and a circular, signed by the chairmen of the Poplar, Shoreditch, and Stepney Electric Lighting Committees, has been addressed to the other borough councils inviting them to send representatives to a conference to consider the question of the municipal supply of electricity in bulk, and, if thought fit, to promote legislation in the ensuing session of Parliament. The Electric Lighting Committee of the Bermondsey Borough Council have signified their approval.

Labour Difficulties.—The differences which arose over the wages question between two of the leading German electrical firms and their employés, which at one threatened to culminate in a lengthened lock-out, have now been adjusted. Several conferences were held with a view to effecting a settlement, but these proved abortive, owing to neither side being prepared to concede any of its claims. The expected extension of the strike to other industries strengthened the men in their resistance, but the lock-out announced by the hardware manufacturers greatly weakened their position, and caused them to surrender. Work was resumed on Monday last on the terms agreed to by the companies before the strike.

Milan Exhibition.—Supplementary to the announcements which have previously appeared in these columns, we are now able to announce that the sum of £1,600 has been offered by the King of Italy for distribution as prizes among the exhibitors. This will be allocated in the following manner: £400 for the best and most original exhibit of machinery or manufacturing process; £200 for automatic safety railway couplings; £200 for the best and safest method of testing high-voltage currents; £200 for the best established method of distributing pure milk in centres population; £200 for the best type of popular dwelling adapted to the climate of Northern Italy; and £200 for motor boats. The exhibition will occupy close upon 200 acres, of which the buildings will occupy 42.

School of Economics and Political Science.—The new curriculum of the University of London at the School of Economics and Political Science comprises lectures on railway subjects, which are to be allowed as an alternative subject for the honours degree, and it is gratifying to note that eight of the leading railway companies are lending their support. Lectures have been arranged for the present session on "Railway Economics and Statistics," by Prof. Chapman and Mr. Bowley; "Law of Contract and of Carriage by Railway," by Mr. Disney; "Economic Factors in Railway Alignment," by Mr. Lynden Macassey; and on the "History and Geography of Railways," by Mr. H. J. Mackinder. On Oct. 25 Mr. W. M. Acworth will give a lecture dealing with the recent history of federal control of railways in the United States.

The Kingsway.—The gates of the Kingsway, which was opened on Wednesday last by his Majesty the King, were operated by electrical apparatus furnished by Electromotors Limited, of Openshaw, Manchester. The gates were attached by means of ropes to electric winches, one on each side of the roadway. These winches consisted of 2½-b.h.p. motors, direct-coupled to worm gears provided with drums for hauling in the ropes. The gold key inserted by his Majesty into the pedestal on the dais closed an electric circuit, which in turn brought the automatic solenoid self-starting switches into circuit, thus starting the motors and gradually opening the gates. When the gates were fully opened, they automatically disconnected the circuit by means of trip switches, thus bringing the winches to rest. The solenoid self-starting switches are of the Sturtevant Company's make.

Tramways and Light Railways Association.—The *Official Circular* for October contains notices of lectures at the Society of Arts, where Mr. T. W. How will read a paper on "Roller Bearings" on the 25th inst., and Mr. A. L. C. Fell one on "Brakes" on Jan. 10. Several other lectures are arranged. A visit is to be paid to the North Metropolitan Electric Power Supply Company's power station at Brimsdown, and also to the sub-stations. The circular also contains the regulations for overhead lines prescribed by the Board of Trade in August under the Electric Lighting Acts, and there is a copy of the Board report for the 1905 session under the Tramways Act. A joint conference of this association with the Municipal Tramways Association and the Association of Tramways and Light Railways Officials is to take place on Nov. 1, under the auspices of the Board of Trade, to further consider the question of amalgamation.

Submarines.—While the submarine A4 was lying in Stokes Bay on Monday last an explosion took place, which was fortunately not attended by any serious personal injury. The submarine had been submerged, and was apparently proceeding all well, when sea-water found its way into the interior, probably through a defect in the valve in the exhaust pipe by means of which spent gasoline vapours are expelled when the submarine is proceeding on the surface. The water got to the accumulators of the electric batteries, and chlorine gas was consequently generated. The officer in command at once took measures to get the boat to the surface, but some gas evidently was ignited by some electric sparks from the batteries, for there was a small explosion, and A4 reached the surface at an angle of about 35deg., with her bows submerged. She regained her equilibrium and was towed towards Portsmouth Harbour, where she was found to be rather badly damaged internally.

The Nelson Light Railways.—The light railway of the Nelson Corporation is one of those concerns which render the public a great service in an unobtrusive way. During the year ended March 31 last a population of

Digitized by Google

42,000 was carried some 43 times at reasonable fares. This enabled the Corporation to realise a gross profit of £1,703 out of a revenue of £6,159. Interest and sinking fund absorb £1,668, leaving a small surplus of £30 odd. Hitherto the Corporation has been unable to make any provision for depreciation, though this is scarcely a pressing matter at the moment, as the system is only a couple of years old. At the same time, it is gratifying to note that Mr. W. Alan Fraser, the manager, is alive to the desirability of building up a reserve fund, which he recommends the Corporation to start at once. But for the unremunerativeness of the Barrowford section the undertaking would probably have shown an appreciable margin. To remedy this, Mr. Fraser counsels an increased fare, so as to make the section at least self-supporting. The Burnley Corporation run through cars, and now that the Colne and Trawden Light Railway Company have completed their lines the Nelson Corporation have again approached the company with a view to inter-running. As both parties stand to gain by the arrangement we imagine the company will return a favourable response, which should result in enhancing the value of both undertakings.

The Rugby Engineering Society.—This society made an excellent start on Oct. 5, and met again on the 19th inst., when Mr. J. Whitcher read a paper entitled "Electric Switchgear." The following further papers and lectures have been arranged: "High-Lift Pumps," by P. A. Mossay, member; "The Testing of Metals," by T. S. Dick, member; "The Design of a Large Shop for Electric Manufacturing," by F. J. Sharr, member. A series of four papers on the economical distribution of energy from coal, as follows: "The Generation of Steam," by J. Brierley and T. Robertshaw, members; "The Conversion of Steam Energy into Mechanical Energy," by E. R. Briggs and A. E. Reynolds, members; "The Conversion of Mechanical Energy into Electrical Energy," by F. H. Clough, member; "The Transmission of Electric Energy," by C. McCarthy Jones, member. The following gentlemen have also kindly consented to give lectures: W. F. Parrish, Esq., chief of technical department, Vacuum Oil Company, on "Lubrication"; J. M. Gledhill, Esq. (of Sir W. G. Armstrong, Whitworth and Co., Limited), on "High-Speed Steel." The council also hope to arrange visits to the Humber Cycle Works, Coventry; the Herbert Machine Tool Company, Coventry; the National Physical Laboratory, Bushy Park, and other places of interest. As no other nominations have been received, the council's nominees are declared elected. The officers are, therefore, as follows: president, F. Samuelson; past-presidents, W. J. Larke (1903-4) and C. H. Wingfield (1904-5); first vice-president, W. R. Watson; second vice-president, E. R. Briggs; hon. recording secretary, E. H. Walker; hon. corresponding secretary, G. Ward; hon. treasurer, F. W. Cooke; hon. librarian, A. W. Fell.

Single-Phase Locomotives.—The Westinghouse Electric and Manufacturing Company have recently secured an important contract from the New York, Newhaven, and Hartford Railway Company for the supply of 25 single-phase electrical locomotives for service on the company's main line, which is being converted to electric traction. The single-phase overhead wire system has been adopted, but the locomotives, which are being built by the Baldwin Locomotive Company, will also use direct current where they traverse the line of the New York Central, which serves the suburbs of New York. Each locomotive will be equipped with four 400-h.p. Westinghouse single-phase motors of the straight series gearless type, and the unit switch system of multiple control will be used. The weight of the locomotives is approximately 78 tons, and with a 200-ton train making stops every 2·2 miles, and attaining a maximum speed of 45 miles an hour, the schedule speed will be 26 miles per hour. Express trains of 250 tons will be propelled at from 60 to 70 miles an hour by one locomotive, but heavier trains will be run by two or more locomotives coupled together and controlled from the forward cab. The motors are to be spring-supported and connected by flexible drive in such a manner that all dead-weight will be taken off the axles. They will be permanently connected two in series, and on direct current the pairs will be operated on the series-parallel system and on alternating current by means of voltage control. Much interest attaches to this new electrical railway, which is the first to adopt electricity over the whole line. The results obtained on the Indianapolis and Cincinnati Railway and other lines which have adopted the same system have proved satisfactory.

Electrically-Driven Printing Plant.—The first installation of electric motors for driving printing presses in Australia has just been laid down on the premises of the *Sydney Daily Telegraph*. The electrification was made practicable by the advent of the Corporation electricity supply, from which the energy is obtained. The order for the construction of the plant was placed with the Australian General Electric Company, and comprises 40 motors, ranging from ¼ h.p. to 35 h.p., with their controlling apparatus, switchboards, etc. The electric current is taken from the three-wire street network at 480 volts on the outers, and to ensure reliability against failure of current a duplicate service is provided. Electric power is used in the composing-room and in the basement for each of the presses. The system which has been adopted by the *Sydney Daily Telegraph* embodies the latest developments of the systems in operation in some of the leading printing establishments in America. In addition to the application of electric power to the printing machines, a number of small motors have been installed in various parts of the establishment for driving saws, air propellers, and lifts. The aggregate power of the electric motors is 154¼ h.p., besides which there are three small auxiliary engines connected with the printing presses. The total cost for power amounts to considerably over £1,000 per annum. There is a direct saving on the cost of running the steam plant under the new conditions, inasmuch as there is no unnecessary waste of power. Each machine has its own independent motor, and no more than the energy actually required for each minute of the day or night is expended. Under the steam system a large engine may have to run for considerable periods to supply power for one small machine, whilst the loss and delay of getting up steam, and the power wasted after the engine is finished with, are factors which have to be taken into consideration. Mr. E. Kilburn Scott acted as consulting engineer for the scheme.

Single-Phase Railway Working.—Mr. C. F. Scott in his paper read before the annual convention of the American Street Railway Association, held at Philadelphia last month, revealed the salient features of single-phase railway working. He also gave some valuable conclusions from experience already obtained with the system. He claimed that amongst the realised advantages of the system were the following: A high-voltage trolley construction had been developed, and proved to be simple, strong, and thoroughly practicable. Thirty-three hundred volts were used, and proved to be safe and reliable. A sliding contact device which does not require reversing when the direction of the car is changed is found more satisfactory, especially for high-speed operation, than the trolley wheel. Its wearing surface lasts longer than trolley

Digitized by Google

wheels operating lighter cars on direct current. Transformer sub-stations supply current satisfactorily without feeders on the trolley-wire side, and without station attendants. The car equipments show simplicity and effectiveness in the control apparatus. Less than half the controller notches required for direct current give equally smooth and as rapid acceleration with alternating current. Platform controllers are simpler, as no magnetic blow-out is required. Difficulties have been met with in the operation of this system. A weak point developed in the armature insulation when the cars had been running for some time. The remedy was obviously the strengthening of the insulation. This brings out the interesting fact that operation on alternating current at 3,300 volts with an intervening transformer is less severe upon the motor than operation on direct current at 500 volts. Experience has shown wherein the control apparatus suitable for both alternating and direct current could be simplified. A company which has been operating two substantially similar suburban lines, one by single-phase current and the other by direct current, could throw out the direct current and substitute single-phase alternating current.

London Traffic Commission.—Our readers are already familiar with the general conclusions arrived at by the Commission, but the report of the Advisory Board of Engineers to the Commission will be of special interest. The volume is a somewhat bulky one, being liberally supplemented by plans and appendices, so in the present note we will review some of the Board's observations contained in the preliminary chapter. Attention is directed to the great number of highway authorities in Greater London, the total being something over 100, and besides this the boundaries appear to be fixed in an irregular manner. The Board emphasise the prejudicial effects of this anomalous state of affairs upon any comprehensive proposal, and point out that in other cities where somewhat similar conditions have existed they have been met either by centralising the component local government, or by realising that street and traffic questions are matters of common interest to the whole community, and by placing such matters in the hands of a single body. The Continental capitals and New York have not hesitated to put themselves to great expense in order to bring themselves up to modern standards and requirements, and Paris, during the latter half of the nineteenth century, constructed a system of new boulevards and avenues, and has lately made a complete underground railway, leased on a profit-sharing plan to a private company. New York and Boston have laid out new streets and widened old ones, and have also assisted private enterprise by placing municipal credit behind extensive railway projects. This policy has in every instance proved successful, either directly or indirectly. The total sum expended out of the county rate and local rates towards new streets and improvements within the administrative county of London during the past 48 years amounted to £18,879,573, whilst in Paris, during a similar period, the sum total expended upon extensions and improvements amounted to £24,772,034. The Commission do not disguise the fact that the proposed improvements will involve a large increase in expenditure, but they are of the opinion that the authorities should take up the matter boldly, and appoint a central body to carry out the improvements outlined in the original report.

Dynamo Iron Loss Increment.—In the *Electrical World* of New York Mr. A. Press discusses the additional iron loss that is generally conceded to occur when a dynamo takes on load. The cause of this iron loss is generally assumed to be due to the flux distortion, in virtue of the armature conductors carrying current setting up a cross flux which compounds with the flux entering from the magnet frame. The author investigates the phenomena of superimposition of such fluxes mathematically, and ascertains the result to be that the eddy-current loss on open circuit of the armature is ordinary no-load loss, and to this should be added the eddy-current loss calculated on the assumption that only the cross flux exists, to give the total iron loss on full load. Comparing the empirical formula devised by the author himself with that used by one of the largest European concerns, it is found that there is quite a substantial agreement in the character of the formulæ. Whereas the one can be reduced to

$$\text{Incremental loss} = D\left(\frac{W}{p\,F}\right)^2$$

the theoretical formula is

$$\text{Incremental loss} = \frac{l\,\lambda}{r\,\delta^2} \cdot D\left(\frac{W}{p\,F}\right)^2.$$

The loss is in watts, and f is the pole-pitch factor—*i.e.*, ratio of pole-shoe span to the pole-pitch; r is the tooth-pitch ratio—*i.e.*, the ratio of the tooth width to the tooth width plus the slot width; W is the output in watts; p is the number of poles; F is the flux per pole in C.G.S. lines; δ is the depth of the air-gap in centimetres; λ is the depth of slot and l is the length of core. Checking in this way five machines, the following results are obtained:

Size of machine.	Empirically derived loss. / Theoretically derived loss.
60 kw.	1·64
125 ,,	2·2
250 ,,	2·43
500 ,,	2·65
1,000 ,,	3·32

It is to be noted that the experiments were conducted with a machine of about 50 kw. capacity. It was well understood that the above empirical formula was not entirely satisfactory. It gave much too large values for machines of considerable output.

Electricity Supply.—The electricity department of the Fulham Borough Council, which last year converted a deficit of £2,569 into a net profit of £1,029, evidently intends to improve upon this result, judging by a well-illustrated circular just received from Mr. A. J. Fuller, the electrical engineer. The Council has considerably reduced its charges, which now stands at 3½d. per unit, with a graduated discount, meters being supplied gratuitously. In addition to its economic advantages, the opinion of the Phœnix Insurance Company is quoted in regard to the safety of electricity, while an extract from the *Lancet* is given in proof of its hygienic qualities. Mr. Fuller does not omit to impress upon shopkeepers its great superiority over other illuminants for the purpose of display, as there are no flames to set fire to flammable materials or soot to discolour them. We are glad to see that consumers are enjoined not only to purchase standard lamps, but, when the blackening becomes bad, to promptly renew them. As the life of a lamp is a matter which, though simple enough, the average consumer does not appear to comprehend very well, Mr. Fuller wisely offers to send assistants to advise consumers as to the state of their lamps, or to test free of charge any lamps brought to the electricity works. Having recently tested various types of small arc lamps with eminently satisfactory results, Mr. Fuller is prepared to give advice on this special branch of lighting. Several types of radiators are shown, and as the Council supplies power at 1d. per unit it is calculated that the cost per hour would be only about ½d. Illustrations are included to show the artistic effects that may be obtained with these radiators in drawing-rooms, libraries, etc. It is evident that the value of electrical energy for power purposes is meeting with increasing recognition from the

Digitized by Google

manufacturers of the districts, as in two years the quantity of energy consumed for this purpose has increased more than eightfold. The circular points in this connection to the advantages of electric motors as requiring very little repair and small space, and as a much cheaper form of mechanism than the gas-engine. The department has a list of contractors who are willing to instal motors on the hire-purchase system. It may be mentioned that the National Boiler and General Insurance Company, Limited, insures electric motors at lower rates than gas-engines. Cogent reasons, supplemented by interesting illustrations and eloquent testimonials, are given why the electric motor should also find its way into printing rooms, tradesmen's machinery rooms, hairdressers' premises, and even into private houses. With the numerous advantages of electricity as stated, the Fulham Council should be in a fair way to increasing its volume of business.

Obituary.—We deeply regret to record the death of Mr. Alfred Morcom, the chairman of the well-known firm of Messrs. Belliss and Morcom, Limited, which took place at Edgbaston on Monday last. Mr. Morcom was but 57 years of age. He was born in the Isle of Man, but his parents were Cornish, and he was educated at the Tavistock Grammar School, Devonshire. From school he passed into Keyham as an engineering student at the Royal School of Naval Architecture, which is now merged in the Royal Naval College, Greenwich. A successful career with the Admiralty followed. He was appointed chief engineer at the Portsmouth Dockyard, where he had to do with transport and warship arrangements for the Egyptian expedition and bombardment of Alexandria. Then he was sent in the same capacity to the dockyard at Sheerness, where he rendered conspicuous service to the Admiralty and the nation. It was during his official connection with the Government at Portsmouth and Sheerness that Mr. Morcom became interested in the work of Mr. G. E. Belliss, the founder of the well-known marine engineering firm in Ledsam-street, Birmingham. At that time Mr. Belliss was chiefly engaged in the construction of steam pinnaces and launches for the navy, and after remaining at Sheerness five or six years, Mr. Morcom, in 1884, decided to leave the Government service and join Mr. Belliss in partnership. From that time the business of the firm of Belliss and Morcom was largely developed. Under Mr. Morcom's supervision the machinery for torpedoes as well as for torpedo boats and torpedo-boat destroyers was added, and in 1890 practically a new industry was commenced, consisting of the manufacture of high-speed engines for electric generating purposes. The Belliss engine was perfected for this purpose, and now holds the premier position of its class. Electrical engineers will remember with interest the keen fight between the forced system of lubrication adopted for this engine and the splash lubrication as used on many of its rivals. Commercial experience has proved that Mr. Morcom was right in his choice of forced lubrication. The firm in 1893 was converted into a private company, Mr. Belliss becoming the chairman and Mr. Morcom the managing director. Then in 1904, when Mr. Belliss retired from the activities of a business life, Mr. Morcom succeeded him as the head of the concern. The success of the firm has been due to a gradually built up reputation for thoughtful and able design and perfect workmanship, and the credit of this achievement has been largely the result of the inventive energy and ability shown by Mr. Morcom in the management of the works and in the training of the staff. Mr. Morcom was a member of the Institutions of Naval Architects, Civil Engineers, and Mechanical Engineers, and he was also a member of the council of the Birmingham University.

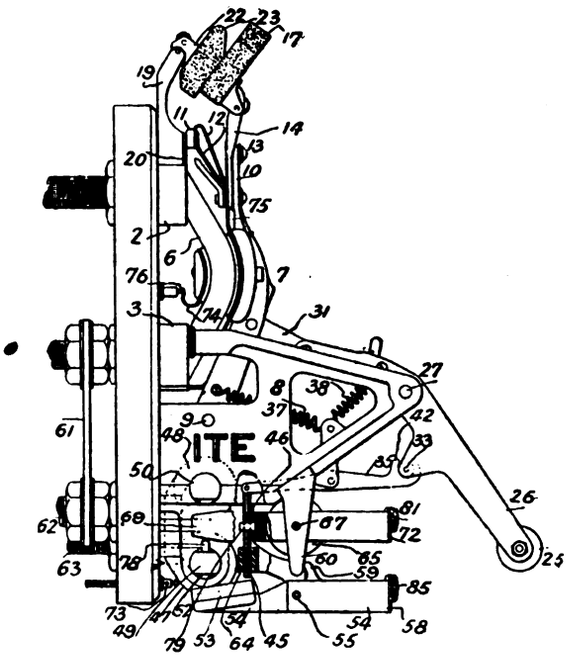
Electrical Manufacturers' Association. — On Monday last a meeting of the National Electrical Manufacturers' Association was held at the Olympia, to which a number of manufacturers who have not yet joined the association were invited. The chair was taken by Mr. Walter Davenport. He explained that it was the first meeting since the association had been incorporated. After referring to the general objects of the association, he said that as the membership extended they would divide into special sections, which would each deal with special branches of the industry. Amongst the business considered was that of provincial exhibitions. It was decided that members of the association should not send goods to such exhibitions unless the supply undertakers organising the same paid carriage on the goods both ways and were responsible for any damage done. It was stated that the Exeter Corporation had agreed to organise its forthcoming exhibition on these lines, which would save manufacturers very large expense. The question of railway rates was also discussed, and a committee appointed to secure more equal treatment in the transit of goods between various manufacturing centres in the United Kingdom. The meeting decided to appoint an expert insurance broker, whose services would be at the disposition of the members with a view reducing insurance premiums. There would be no charge for such advice. The success of the circulars issued by the association declining to contribute to "beanfeasts" led to a suggestion that Christmas boxes might be treated in a similar way. A considerable discussion revealed great want of unanimity on this point. Christmas boxes were termed "blackmail" by one speaker, and "friendly presents" by another. The views of the engineer who finds his hall occupied with nine turkeys, eleven boxes of cigars, and a liberal supply of whisky when he returns home on Dec. 24 were not communicated to the meeting. There is no doubt that the practice of giving extensive Christmas boxes should be curtailed. It was decided that the members of the association should not take stands in any exhibition organised by an outside authority. It seemed the opinion of the meeting that, in spite of the very great success of the present exhibition, three years at least should elapse before another one was held. In the evening a dinner was held at which the members of the association met a few special guests. The toast list was commendably short, and included, besides the loyal toasts, the following: "Success to the Association," proposed by Mr. J. E. Edgcome and responded to by Mr. C. S Northcote; "Success to the Exhibition," proposed by Mr. David Smith and responded to by Mr. Albion T. Snell and Mr. Russell, joint consulting engineers for the exhibition. In reply to this toast, Mr. Snell said that 21,000 persons passed the turnstiles on Saturday last, which was a record for exhibitions at Olympia. The toast of "The Chairman" was proposed by Mr. E. Cuncliffe Owen, and Mr. Walter Davenport's reply terminated an enjoyable function.

Technology of the Law.—The leading American electrical companies make liberal provision for a patents fund, and the number of judgments delivered in the United States courts which reach this office from time to time explain how a goodly portion of this fund becomes transferred from the debit side of the company's books to the credit side of their lawyers' ledger. The latest of these judgments to arrive is that in which the American Thomson-Houston Electric Company sought an injunction against the Salem Electric Company to restrain them from infringing the plaintiffs' series and multiple distribution system. After the usual lengthy formalities, the case came on for trial, and resulted substantially in a victory for the plaintiffs. It is tolerably certain that while there is a

Digitized by Google

patent system there will be patent litigation, but the multiplicity of lawsuits suggests that something leaves a great deal to be desired—a remark which applies to both sides of the Atlantic. Does the fault rest with the Legislature, which enacts the laws; the Patent Office, which administers them; the judicial Bench, which interprets them—or whom? Speaking for this country, the patent system, by general consent, has hitherto been far from perfect, but it is considered to have been materially improved by the regulations which came into operation this year by virtue of the Act of 1902. Of the Patent Office it may be said that the majority of the officials, of all grades, discharge their functions with reasonable care, and occasionally with ultra-carefulness. Are we then to infer that much of the blame for litigation is to be laid at the door of the Bench? Assuredly not. Our judges weigh the facts with much care, but, despite their traditional omniscience, they cannot be expected to be technical experts as a matter of course, and consequently their decisions may lack lucidity. It will be remembered that when discussing this subject on previous occasions we suggested that either counsel with technical qualifications should be appointed especially for such cases, or, if at any time no such members of the Bar were available, that the judges should have the assistance of experts, much as the Admiralty Court is aided by nautical assessors. Certainly, such cases as that which occurred the other day at the Shoreditch County Court, where the Brockie-Pell Arc Lamp Company brought an action to recover £7. 5s. for repairs, are rather difficult to deal with. Judge Smyly, while remarking that the charge seemed to him, as a layman, to be decidedly excessive, frankly declared his incompetence to give a legal decision on the point, and stated that it would be necessary to call an expert. Plaintiffs' counsel strongly deprecated this, on the ground that the amount in dispute did not warrant such expense, and in this case the matter was compromised. It would clearly be impracticable to appoint special technical judges to county courts, and, as in the instance just quoted, the amounts involved do not justify the services of an expert; but these cases concern relatively small issues. For the larger questions, however, the need of some revision in the present mode of procedure is obvious, and we trust that ere long it will come in for serious attention.

Automatic Cut-Outs.—A patent has been granted in this country to Mr. Wm. Scott, of Philadelphia, U.S.A., for a form of automatic cut-out, which is described in the *Official Patents Journal*. In the accompanying illustration the terminals, 2, 3, of the circuit are adapted to be connected by an insulated laminated bridge, 6, carried by an arm, 7, pivoted at 9 to the frame, 8. An extension, 10, of the arm, 7, carries springs, 12, supporting a movable metallic contact, 11, and limited in their movement by a stop, 13. The contact, 11, engages a plate, 20, carried by brackets, 19, on the terminal, 2. A carbon contact, 23, carried in a bracket, 22, pivoted to the brackets 19 is engaged by a carbon block, 17, similarly pivoted in an arm, 14, secured to, but insulated from, the extension, 10. The arm, 7, is operated through a link, 31, from a lever, 26, pivoted at 27 to the frame, 8, and fitted with a handle, 25. The switch is held shut against the pressure of springs, 37, 38, by a hooked lever, 35, pivoted to the frame, 8, and engaging a roller, 33, on the lever 26. When the lever 35 is turned in a clockwise direction, its hooked end, 32, is released, and an inclined lug, 42, formed on it engages the roller, 33, and forces the switch open. The lever 35 is operated by a pin, 45, pivoted to the end of the lever, sliding in a fixed guide, 64, and fitted with a cross-pin, 46. On the occurrence of an overload, the pin, 45, is operated, so as to trip the catch, 32, by armatures, 53, of an electromagnet, 47, connected in parallel with a similar electromagnet, 48, between a terminal, 62, connected by a bar, 61, to the terminal 3 and a terminal, 63, connected through translating devices to the bus bars, etc. Flattened portions, 52, are formed at each end of the core, 49, of the magnet, 47, opposite to the armatures. The armatures are carried by bars, 54, pivoted to the frame at 55 and connected at their other ends, which are unequal in length, by a slotted bar, 58, in which is secured adjustably a weight, 85. By adjusting the weight, 85, according to the scale on the bar, 58, the



operating potential of the cut-out is varied. A lug, 59, on one of the bars, 54, engages a fixed stop, 60, and limits the outward motion of the armatures. Poles, 69, formed on bars pivoted at 67 and connected together by a weighted bar, 72, resembling the bar 58, and arranged between the cores, 49, 50. They are connected by the core of an electromagnet, 65, which is such that the polarisation of the parts, 69, is always opposite to the normal polarisation of the core 49, so that normally the poles, 69, are resting against brass pins, 78, secured to the core 49. On a reversal of current the polarisation of the cores 49, 50 is reversed, and the poles, 69, are attracted towards flattened portions of the core 50, so that an eye, 79, formed on a tie-bar between the bars, 68, and encircling the pin, 45, engages the cross-pin, 46, and trips the catch, 32. The weight, 81, is normally adjusted so as to balance the poles, 69. The armature, 53, may be normally held attracted by the electromagnet, 47, so as to be released and trip the circuit breaker on an underload. The coil 65 is usually of high resistance, and comprises a large number of turns of fine wire. One end of the coil is connected through a binding post, 73, to one bus bar, the other being connected to a fixed contact, 76, adapted to engage an insulated contact, 74, carried by the bridge, 6, and connected by a conductor, 75, to the part 14. The coil 65 is usually in shunt across the main circuit (the coils 47, 48 being in series), but it may be energised from a separate source, or from the secondary circuit of a transformer the primary of which is energised from the circuit to be controlled. The coils 47, 48 may be in series instead of in parallel; or the coils 47, 48 may be in shunt and the coil 65 in series. When used for alternating currents, the electromagnet cores are preferably laminated, and the core of the electromagnet, 65, is enclosed in a brass, copper, or other tube so as to operate like the short-circuited winding of a transformer, to reduce impedance.

THE HASTINGS ELECTRIC TRAMWAYS.

(Concluded from page 516.)

The sub-stations are fed from the main station by Callender's three-core extra high-tension lead-covered cables. At the Silverhill sub-station (Fig. 4) there are three Dick-Kerr standard 200-kw. compound-wound rotary converters, running at 750 r.p.m. and generating direct current at 500 to 550 volts. Each rotary has its complement of three single-phase, oil-cooled, step-down transformers. The rotaries are capable of dealing with an overload of 25 per cent. for one hour. The Bulverhythe sub-station is similar to the one at Silverhill, and is equipped with a similar number of rotaries with the necessary transformers and switchgear. Each rotary has three 70-kw. single-phase oil-cooled transformers, designed and constructed by Dick, Kerr, and Co. The transformers, which are mesh connected, transform current from 6,600 to 340 volts; they are contained in ribbed cast-iron tanks. The secondary coils are insulated from the iron by mica insulation and oil-proof material, the high-tension coils, outside the secondary coils, being insulated in the same manner, special circulating ducts being provided for free circulation of the oil between the iron and secondary and secondary and primary, in order that the core and winding may be thoroughly cooled. The cores and yokes

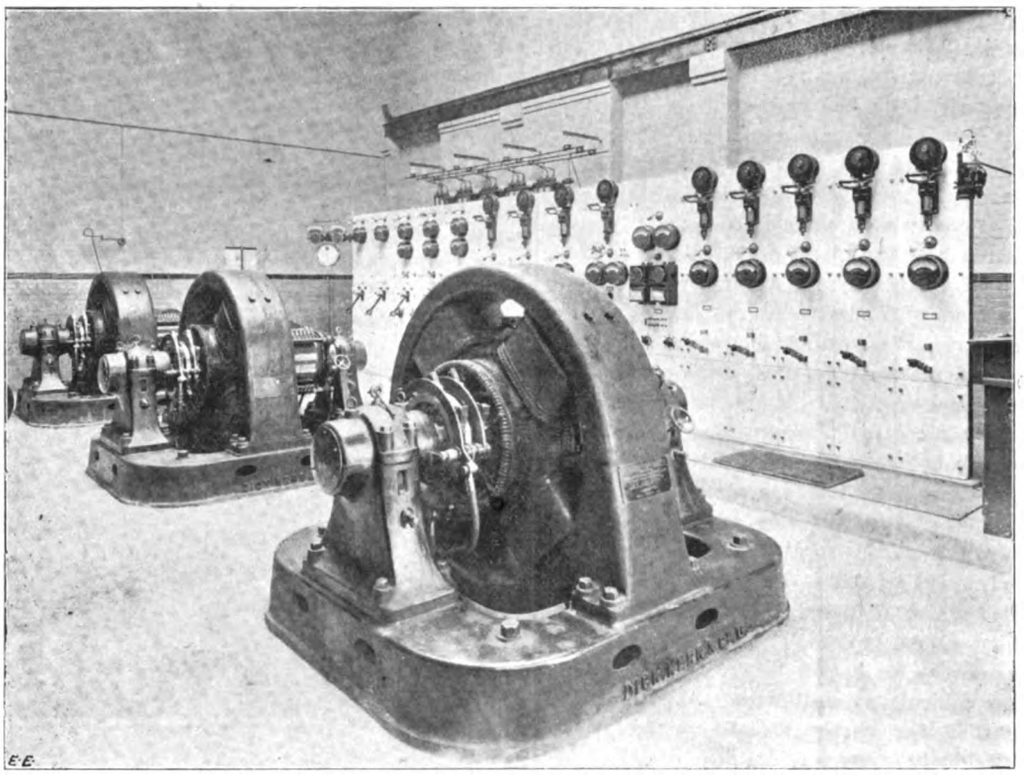

FIG. 4.—The Silverhill Sub-Station Equipment, with Three 200-kw. Dick-Kerr Rotaries.

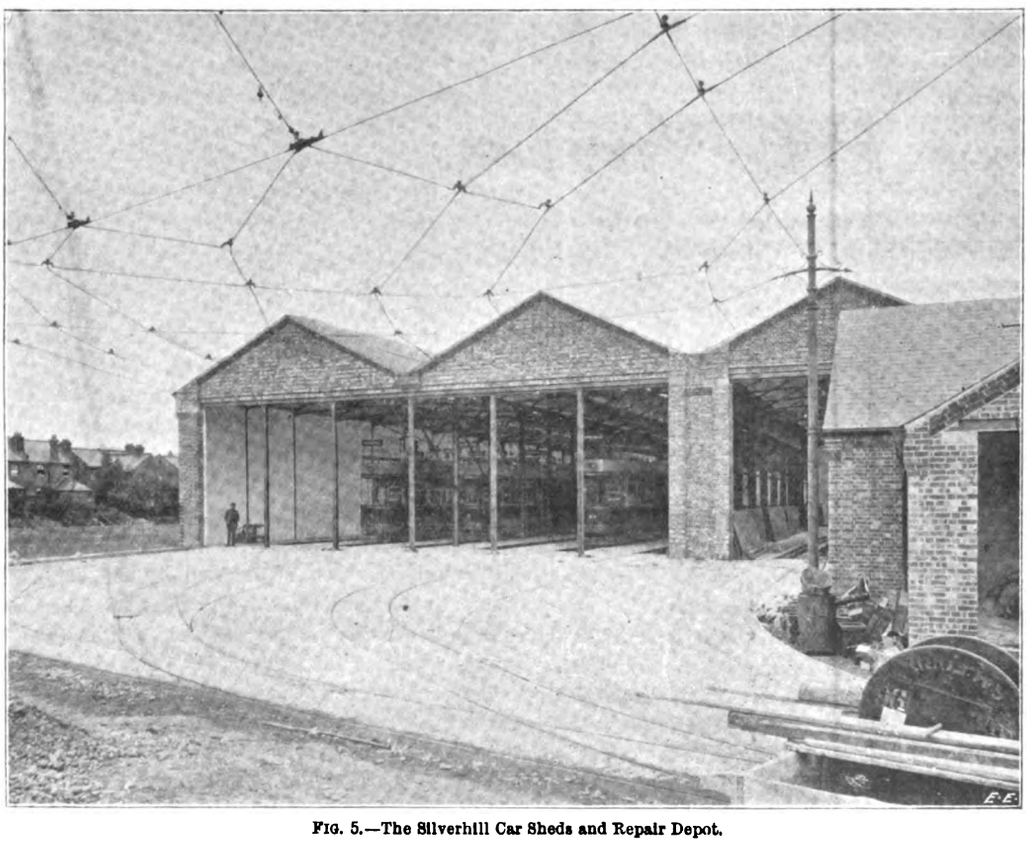

FIG. 5.—The Silverhill Car Sheds and Repair Depot.

Digitized by Google

of the transformers are built up of annealed iron plates of special quality and high permeability, and of minimum hysteresis loss, the plates being insulated from one another by special varnish. The laminations used are free from ageing or increase in hysteresis loss. For mechanical reasons the cores and yokes are securely clamped together in order to reduce the magnetic resistance.

Two car-sheds have been constructed, the principal depôt being situated at Silverhill (Fig. 5), which has six tracks, and is capable of accommodating 36 cars; the other car-shed is in course of construction at Bulverhythe. A well-equipped repair shop has been provided in the former depôt.

The rolling-stock, of which there are already 30 cars in use and 10 more almost ready for delivery, are of the double-deck, single-truck (non-reversed), staircase type (Fig 6), with a seating capacity of 20 inside and 22 outside. They are built in accordance with the most up-to-date designs, and have all the latest improvements in the way of ventilation and finish. The car bodies were built for Dick, Kerr, and Co. by the United Electric Car Company, of Preston. The cars are fitted with lifeguards of the Tidswell pattern and the Waller folding steps. They are mounted on Brill 21-E type trucks, and fitted with a complete standard equipment, consisting of two 6A type traction motors. The controllers are of the D.B.1 form

FIG. 6.—A Steep Grade in Mount Pleasant Road.

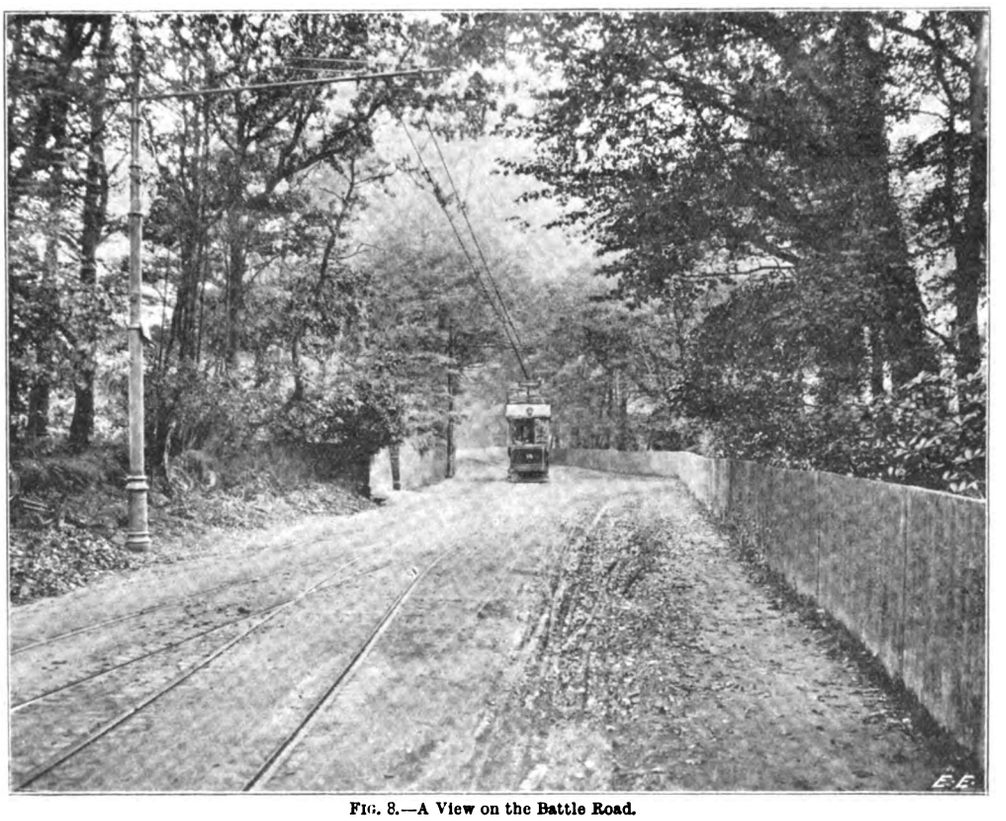

FIG. 8.—A View on the Battle Road.

Digitized by Google

E type, with the patent metallic shield blow-out. Each controller is provided with a "run-back preventer," which makes it absolutely impossible for the car to run away down hill; the movement of the handle to the "off" position short-circuits the motors, in consequence of which there could be only a slow reverse movement of the car. This provision is a most valuable one in view of the heavy grades on the Hastings system.

As shown in the map (Fig. 7), the total length of tramways now in operation is approximately 16 miles of single track, laid to a gauge of 3ft. 6in. The form of track construction mostly used is macadam with granite setts serration, the rails and setts being laid on a 6in. bed of 6 to 1 Portland cement concrete. In cases, however, where traffic is heavy the roadway between the rails and for an average space of 18in. on either side, both double and single track is paved with granite setts 5in. deep and 4in. wide. On part of the route near the centre of the town wood paving throughout has been adopted. In all such cases a 6in. bed of Portland cement concrete extends for the full width of the tramway. The portion across country along the new roadway is of the tramroad sleeper construction, ballasted to rail level. The rails are of the girder type, weighing 90lb. per yard, and are laid in 45ft. lengths, with the customary proportion of shorter lengths to allow for closures. The rails are generally in accordance with standard tramway practice, 6in. deep, with a groove of $1\frac{1}{8}$in. width; ordinary butt joints are used with six-hole fishplates secured by bolts, each joint being fortified by a 24in. length of rail bolted on the under side and embedded in concrete, Neptune copper bonds being used for bonding throughout.

The construction of the overhead lines is carried out generally on the side-pole system (Fig. 8), with bracket arms and flexible suspensions. The poles, which have an over-all length of 31ft., are made up in three sections of lap-welded mild steel, and are erected about 40 yards apart in holes of a depth of 6ft., the excavations being entirely filled in with concrete. The trolley wire is of hard-drawn copper, 4/0 S.W.G., having a diameter of ·400in., with a breaking strain of 22 tons per square inch. Section insulators are provided so that each half-mile of trolley can be disconnected if necessary. The extra high-tension feeders are composed of three-core, paper-insulated, lead-covered, and armoured with steel wire, each cable being laid in a separate trough and run in solid with bitumen. The low-tension cables are insulated with vulcanised bitumen, and are also laid solid in troughs. The whole of the feeder cables, both high-tension and low-tension, were supplied by Messrs. Callender's.

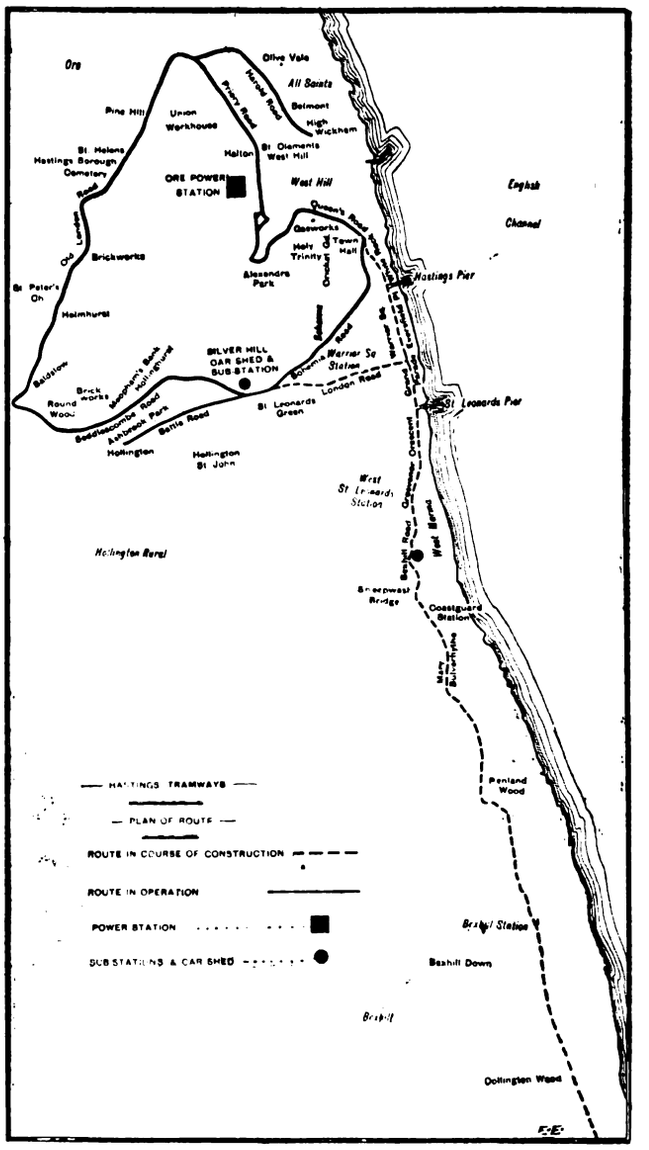

FIG. 7.—Map of the Hastings Tramway System.

The map (Fig. 7) shows the country the complete system will cover. Thus the scheme embraces two main routes: (1) a circular route through Baldslow and Ore, with branches to Hollington and the old town of Hastings respectively; and (2) a line along the front through

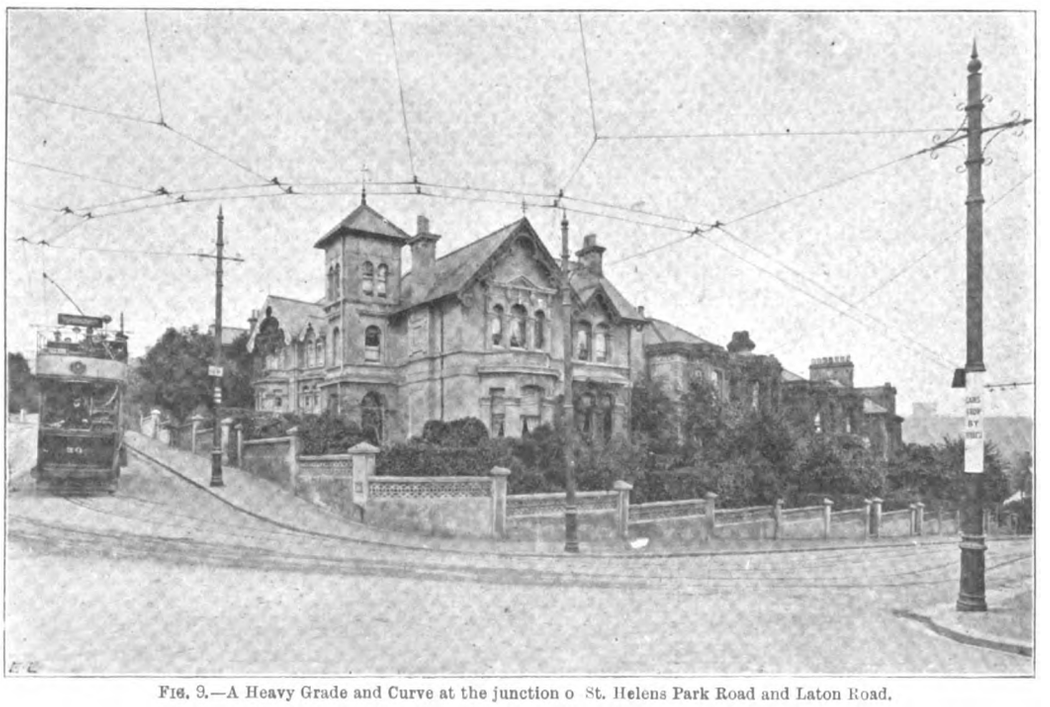

FIG. 9.—A Heavy Grade and Curve at the junction o St. Helens Park Road and Laton Road.

Digitized by Google

St. Leonards to Bexhill. The first route is now in operation, but some little time will elapse before the line is completed to Bexhill, although the permanent way beyond St. Leonards is now in course of construction, and a considerable length has been completed. The main portion of the system is of the usual tramway construction, but on a section of the route towards Bexhill the line leaves the main road and crosses through fields by means of a new road, 30ft. in width and about five furlongs long, constructed by the company. When complete the system will be some 30 miles in extent. It should serve the needs of a large permanent population, and will be much appreciated by the numerous visitors to Hastings and Bexhill.

As mentioned last week, the contractors for the whole of the work have been Dick, Kerr, and Co., Limited, the consulting engineers for the scheme being Messrs. Kincaid, Waller, Manville, and Dawson.

THE LANCASHIRE ELECTRIC POWER COMPANY.

(Concluded from page 513.)

The floor of the turbine-house—like the firing floor of the boiler-house—is 9ft. above the foundation slab; on this basement are the foundation columns for the turbines and exciters, also the pumps for raising the circulating water from the river. The latter are direct motor-driven centrifugals, and each capable of delivering 160,000 gallons against 28ft. head, the inlets being separate and the outflow common. The end of the outflow is under water, so that air cannot get back and spoil the syphonic action. The oil-pumps for the system are also in the basement; these pump to a reservoir at the top of the building, the oil flowing by gravity to the various bearings. The pumps are driven by a rod actuated by the hydraulic pumps on the floor above.

The main cables from the generators and all the other cables are fixed to the ceiling of the basement, being thus in sight and at the same time in a safe and convenient position. They are brought through the wall into the switch-rooms. These are in three storeys — one on the basement level, one on the engine floor, and the third on the operating gallery above. In the basement are the potential transformers for reducing the pressure from the generating voltage to that suitable for operating the voltmeters. These transformers are each partitioned off in brick chambers.

On the floor above are the first main switches. The current is led from the generators to these switches, which are of the B.T.H. standard motor operated type, each in its own compartment, and consisting of a plunger with three limbs, one for each phase. The current is brought to a contact in the bottom of a tube, on the top of which is an insulator through which a plunger passes—the tube is filled with oil, so that when the contact is broken the arc is extinguished by the oil. The plungers are connected to wooden rods passing through to the operating mechanism, which consists of a small motor and a system of strong springs. This motor is connected by a magnetic clutch to the levers, and on being started releases one spring, closes or opens the switch, and compresses the spring in the opposite direction. The current now passes to the 'bus bars. These are in the centre of the same chamber, and are of bare copper supported on insulators enclosed in brickwork with suitable holes for inspection. They are in two sections, each section taking two machines. From the 'bus bars the current passes to the floor above to other oil switches, which connect the feeder circuits on to the bars. Each circuit has two mains, and one of each of the mains is connected to the various bars so as to give additional safety. From these circuit switches the mains pass out through the walls on to the overhead construction. Before leaving the building they are connected to a device for preventing undue rises of pressure, which consists of a series of metal discs placed in a row, with carbon resistances in series, and the end connected to earth. In the event of an undue rise of pressure the electricity jumps across the gaps and goes to earth, the carbon resistances causing enough obstruction to prevent an arc being maintained.

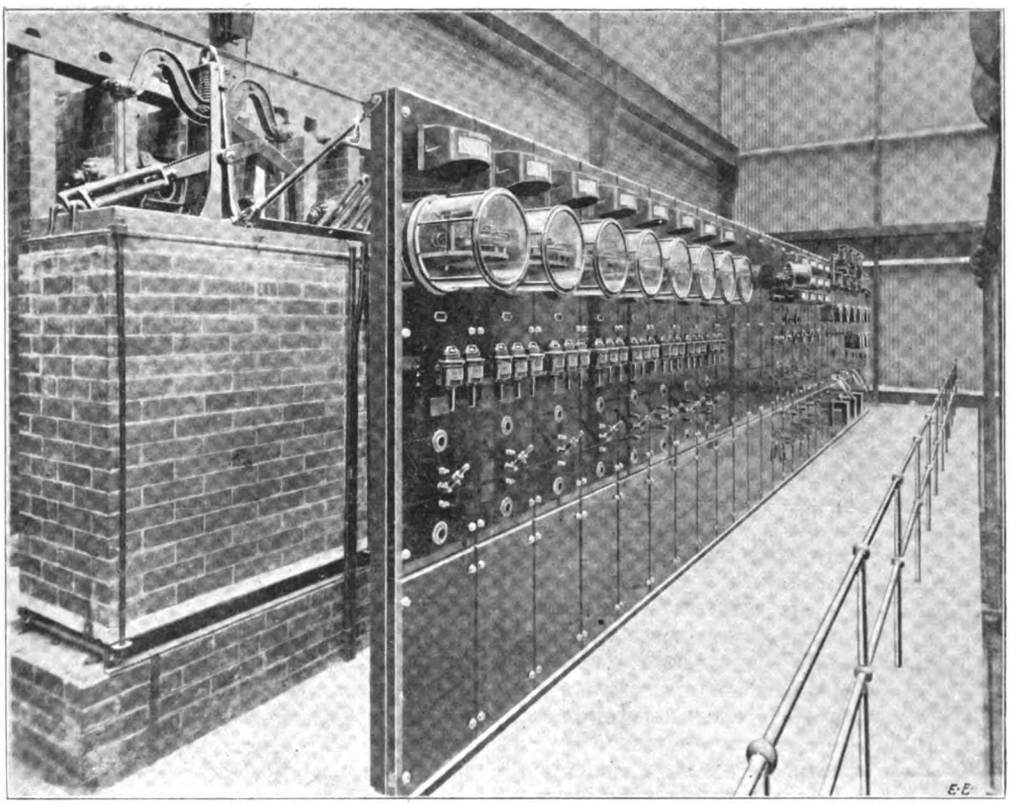

FIG. 8.—Radcliffe Power Station—Main Switchboard.

The control for the oil switch motors, and, in fact, all the controlling apparatus in the station, is mounted on the operating board (Fig. 8), low-tension current from the exciter circuits being used to drive the switch motors. Current from the current transformers operates the ammeters and automatic cut-outs, while the voltmeters are operated from the special potential transformers before described. Thus no high pressure is brought near the operating board, no heavy current and no big switches are there, and so the handling is extremely simple, one man being able to easily deal with the whole plant. The arrangement also is very safe, for there are no large powers

Digitized by Google

to cause electrical fires, and even in the case of some small mishap, the main cables, being nowhere near, cannot be affected, and the supply in consequence is not interfered with. All the current from the exciter sets is brought up to a low-tension board at the end of the operating gallery and distributed from there.

Fig. 9 illustrates diagrammatically the general arrangement of the turbine-house plant and connections between it and the switchboards. We have cut out two of the main turbo sets to save space and gain clearness.

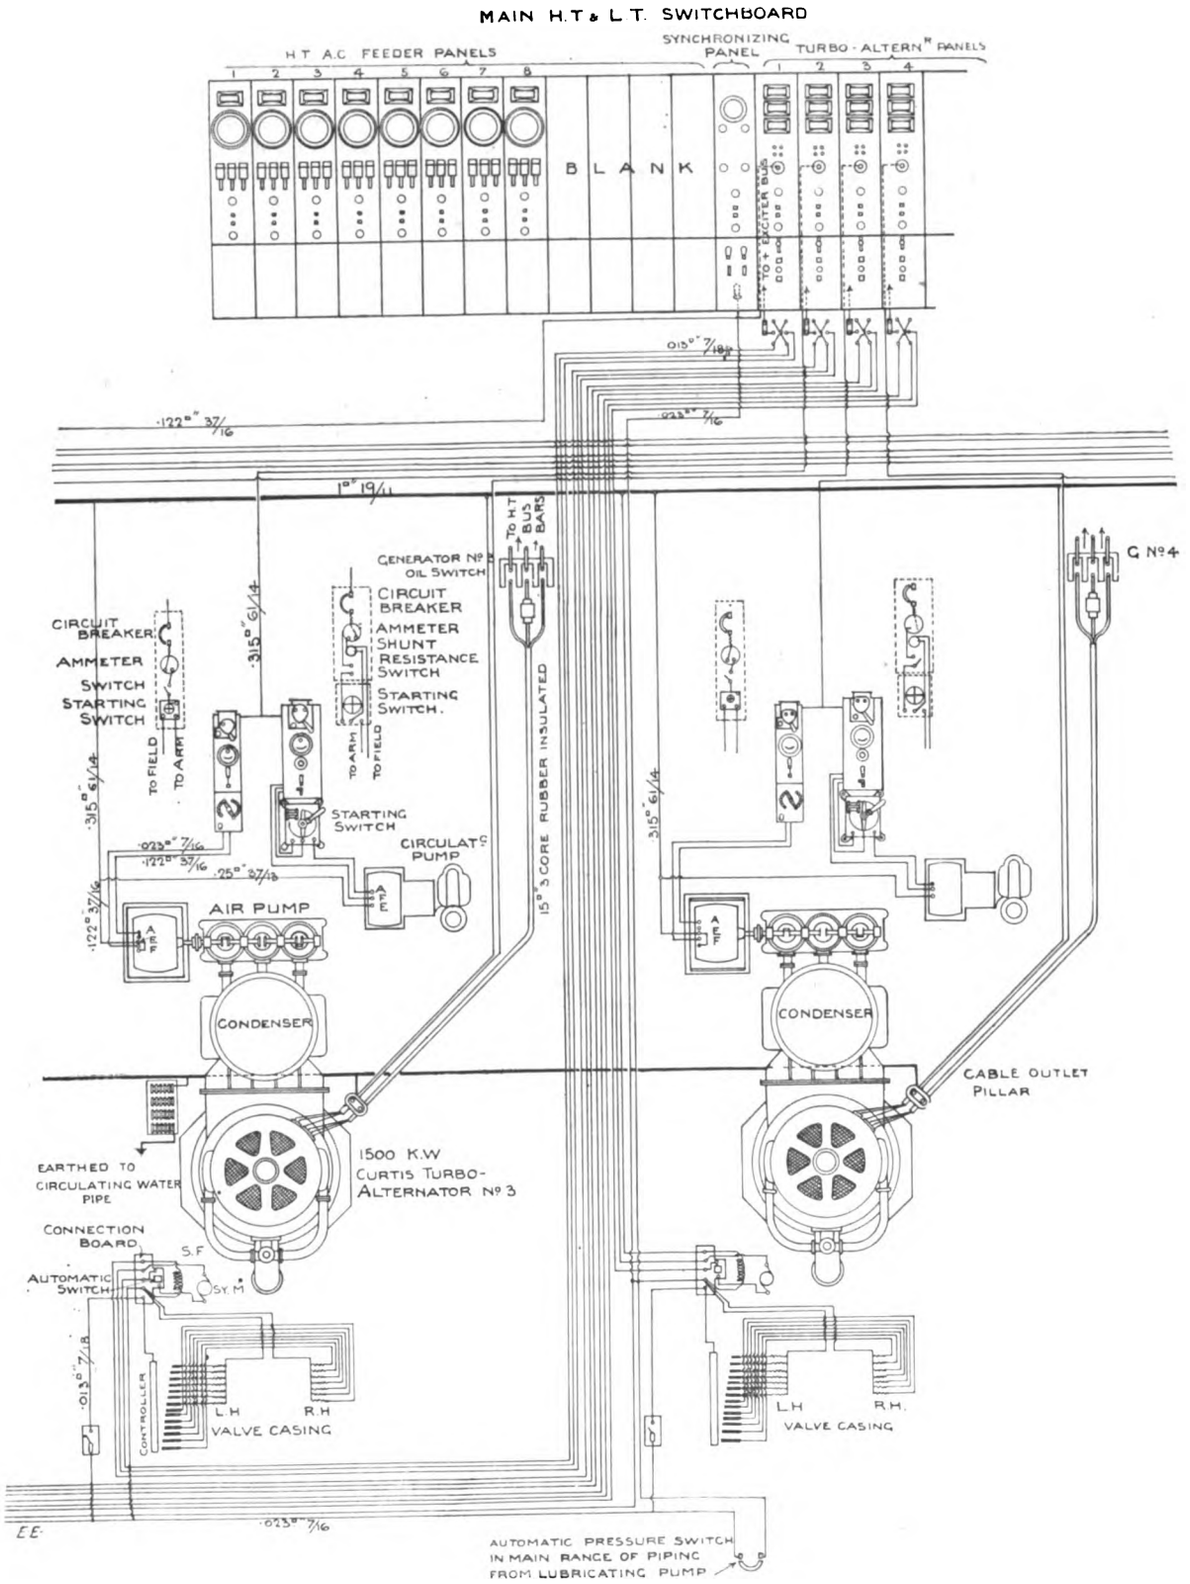

FIG. 9.—Radcliffe Power Station—Diagram showing the Connections between the Turbine House Plant and Switchboards.

There are, as will have been gathered, several interesting features about the design of this power station. It is laid out on the unit principle. One bank of three boilers with one chimney and auxiliary plant feed two turbine sets, which feed one section of the 'bus bars; these comprise one complete unit, and each unit can be worked quite independently of the other. When extensions are added this will be quite simple, as it will only mean adding one or two more units. The only difference will be that, instead of two small turbine sets to the unit, one large one will be installed. Economisers have been discarded, and the auxilary engines are run non-condensing, the exhaust being passed through feed heaters for raising the temperature of the boiler feed. This plan makes for simplicity, does away with the oil trouble, and saves first cost at the expense of a little—and only a very little—coal. The arrangement of the boilers enables the minimum possible of steam main to be used. Vertical turbines permit of an exceedingly compact engine-room. The whole arrangement is so simple that a shift of six or seven men can look after the entire plant of some 10,000 h.p.

The work of erecting the turbine-house plant has been superintended for the British Thomson-Houston Company

Digitized by Google

by Mr. W. Kingsford, and from start to finish there has been no hitch—a fact which greatly redounds to the credit of all concerned.

Now with regard to the outside work. The mains, as previously mentioned, leave the station overhead, and are partly underground and partly overhead, as may be most suitable. They are arranged in duplicate on all routes, each being designed to carry 1,500 kw. at 10,000 volts.

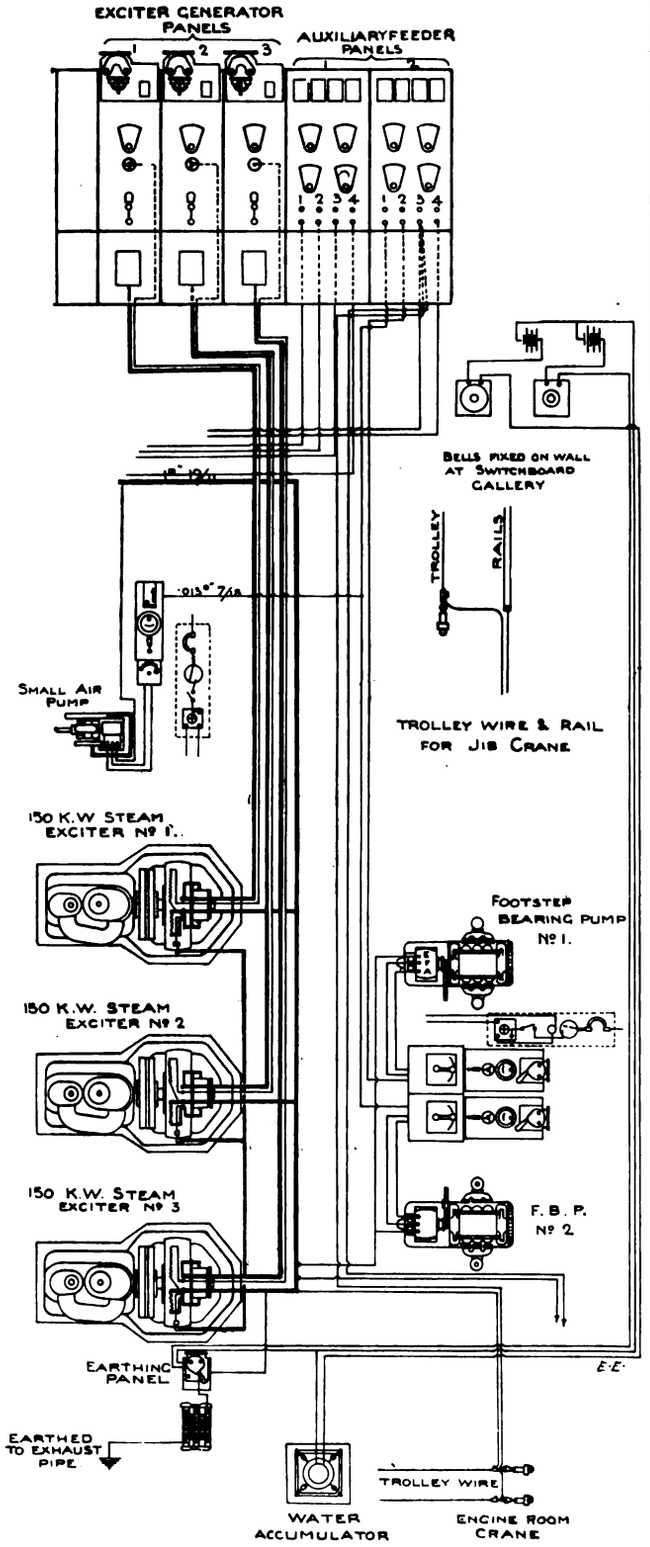

FIG. 9.

The aerial construction is distinguished by its simplicity, consisting of wooden masts carrying cross-arms, which in turn carry the mains. The latter are of bare copper wire supported on double porcelain insulators completely glazed, and the three wires, corresponding to the like number of phases, for each main are arranged in pyramid fashion, one set on either side of the supporting masts. Details of the method of connecting these wires with the underground cables must be held over till a later date. The underground cables are three-core, paper-insulated, lead-covered, wire-armoured, laid solid in wooden troughing for the most part. But in some cases ½in. iron troughs with covers are used, notably over Ringley Bridge for the mains to Swinton sub-station. These troughs are further protected by bricks between and on either side, then a layer of earth, a ¼in. boiler plate, more earth, and finally the ordinary paving setts over all. No doubt ample mechanical protection is thus given to these extra high-tension mains. The whole of the cable work has been carried out by Callender's Cable and Construction Company, Limited, and it is due to this firm's representative on the spot—Mr. W. Pierce—to record the highly satisfactory manner. Not a single fault has developed, which is remarkable when the great care and vigilance necessitated by the nature of the work is considered.

As to the commercial prospects of the undertaking, it will be gathered from what follows that much has been already accomplished in the way of obtaining a load. Contracts are being entered into with the various local authorities for supply, either by the local authority putting down the distributing mains and taking a supply in bulk, or giving transfer of their provisional order to the company and the company seeing to the distribution work. The company also enter into contracts with the users of power, supplying them on behalf of the local authorities interested. Several contracts of great interest have been entered into, notably one with the Acme Mill, which has 75,000 spindles, both mule and ring. This mill is of entirely new construction. Indeed, it is not yet working, the equipment being still far from complete. The power requirements are naturally very extensive. Two 10,000-volt, three-core, paper-insulated mains are led into a dividing box, whence bare conductors pass isolating switches to the high-tension sectionalised 'bus bars, and thence through oil switches to four transformers, each having a capacity of 300 kw. These transformers are of the B.T.H. type arranged for air-blast cooling. On the corresponding switch panels are mounted switches provided with an automatic tripping device. From the low-tension 'bus bars the current is conveyed to a switchboard placed in a separate room on the floor above, whence it is distributed to the various circuits. An indicating watt-meter is provided for each motor circuit, and the switchboard is further fitted with tripping switches of similar design to those on the transformer panels. High-speed lines of main shafting are fitted throughout the mill, the motors being direct coupled, their speeds varying between 585 r.p.m. and 565 r.p.m. This constitutes a feature of decided novelty, especially inasmuch as no floor space is occupied by the motors, all being fixed overhead. The motors are of the squirrel-cage type up to and including 75 h.p., while slip-ring machines are employed for higher outputs. They range in size from 5 h.p. to 200 h.p., and represent a total output of 1,200 h.p. The cables from the switchboard to these motors is three-cored, armoured throughout, and was fixed by Messrs. Eckersley and Co., Manchester. There is also a lighting installation, comprising 1,000 16-c.p. lamps or their equivalent. The wires to these lamps are run in screwed tubing all through, Messrs. E. M. Evans, Manchester, having carried out this part of the work. The motors are supplied with current at 400 volts, while a 230-volt supply is given for lighting. A 30 per cent. load factor is obtained, including the lighting of the whole mill.

It is interesting to compare the cost of the electrical power plant installed with that which would have been entailed in equipping the same mill for steam driving. This comparison shows that the millowners have effected a saving of, roughly, 10 per cent. on the total capital outlay, or, in other words, £10,000 on an expenditure of £100,000 for a mill containing 75,000 mixed spindles. This figure does not, of course, take into account the cost incurred by the power supply company. The same owners—*i.e.*, the Pendlebury Spinning Company—have a steam-driven mill of modern construction and the same size adjoining, so that electricity will be afforded a splendid chance of proving its superiority. A very considerable gain is anticipated in the output of the mill due to steady driving, and if any means can ensure that gain the Curtis turbine certainly will.

The Acme Mill is unique so far as Lancashire is

Digitized by Google

concerned in that it has no chimney shaft, and for that reason we have reproduced the photograph herewith (Fig. 10). In another instance we saw preparations in progress for the application of electrical driving to flannelette making and other machinery, whereby beam engines of very ancient construction will be displaced. This is a comparatively small installation of 100 kw., but has interesting points, notably in connection with the sub-station. Naturally, this will be entered only by responsible persons connected with the power company, but provision is made whereby the transformer can be thrown over from one feeder to the duplicate main from outside should a fault develop in the supply. But the arrangement of the switchgear is such that while the load can be thrown in turn off the second feeder, it cannot be retransferred to the first without entering the sub-station. Thus every eventuality is provided for. It will have been gathered that the transforming from 10,000 volts to the supply voltage is accomplished at one step at the point of consumption, thereby ensuring maximum economy in transmission and distribution. We understand that the applications already made for a supply from the company's mains are sufficient to load half the generating

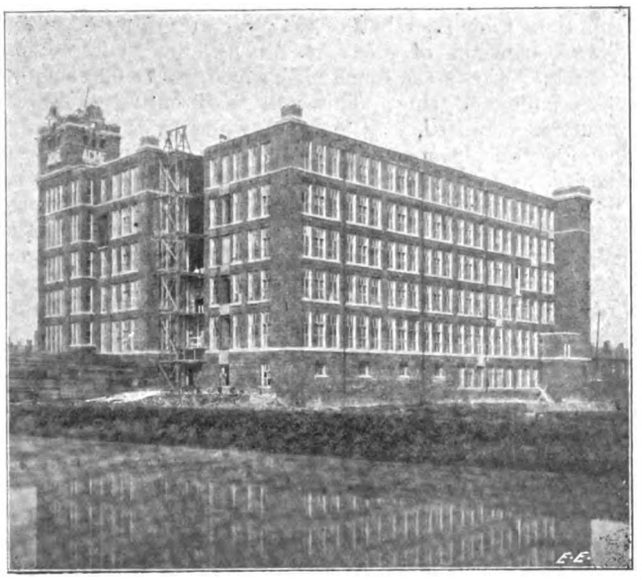

FIG. 10.—A Mill without a Chimney—The Acme, Pendlebury.

plant at present installed and pay all expenses on the capital outlay incurred. Of course the power house as it stands to-day is only the nucleus of what is to follow. It is intended that it will be increased to many times its present size in a very short time. Other power stations will be added in other districts as the necessity arises, each taking small coal from the surrounding collieries.

The consulting engineers are Messrs. Lacey, Sillar, and Leigh, and Mr. H. Parshall, while Mr. Robert Loraine Gamlen is the resident engineer and manager. It must be admitted that the commercial possibilities of electricity supply over wide areas with scattered centres of consumption are largely problematical, and that the solution of the problem calls for energy and abilities of no mean order, but we are convinced that Mr. Gamlen will attain success if it lies anywhere within the range of practical politics. The keenness which pervades the members of the staff under him is remarkable, and proves he has inspired them with some of his own enthusiasm. Moreover, due to his initiative, an association of the staffs of several power supply companies has been formed, the idea being to meet together, sometimes in one area and sometimes in another, to discuss questions of mutual concern This strikes us as being a particularly happy notion, since the interests involved are absolutely identical, and mutual assistance in overcoming the many difficulties which must necessarily arise in the process of development will be of immense value. Mr. Gamlen's grasp of the economics of electric power distribution is well illustrated by the paper which he recently communicated to the Institution of Mining Engineers in Manchester, and which was reported in our issue for Sept. 15 last.

In conclusion, we have to thank Mr. Gamlen for his courtesy in showing us round the Radcliffe power station and the sub-stations, etc., to which reference has been made; also for the photographs reproduced and most of the accompanying particulars.

RECENT PROGRESS IN ELECTRIC LIGHTING AS INDICATED BY THE OLYMPIA EXHIBITION.

BY FRANCIS H. DAVIES.

(Continued from page 484.)

INCANDESCENT LAMP MANUFACTURE.

The stall of the Ediswan Company—an illustration of part of which is given (Fig. 5)—is one of the most interesting in the exhibition, both from the up-to-date and the antiquarian point of view. Except for the actual operation of making the glass and blowing the globes, practically the whole process of lamp-making is carried out in the exhibition. The Ediswan Company claim to be the only British firm which manufacture their own glass, their works at Ponders End being equipped with the most modern appliances for this purpose. Several large furnaces, stoked by machinery, are kept going day and night, and here the raw material is melted down in large fireclay pots, being reduced to a white heat. The blowing process follows, taking place in the same rooms as the furnaces are situated. It consists of dipping into the molten material a long glass tube, upon the end of which a lump of fused glass adhers when it is withdrawn. By rapid motion through the air this lump is caused to assume an elongated shape, and when in this condition it is placed in a mould and blown, with the result that the globe takes exactly the right form. The bulbs are then broken off and sent to the sorting department, where they are subjected to a rigid scrutiny and faulty ones rejected.

As far as the glass goes, it is at this stage that operations are commenced at Olympia. The filament, likewise, is put through all the preliminary processes at the works, being delivered at the stand in unsorted bundles but ready carbonised. As is well known, it is made out of cotton wool, which, by chemical treatment, is converted into a cellulose thread. According to the approximate size of the filament required this cellulose is forced through nozzles of various sizes, falling into a spirit solution, where it hardens and attains something of the appearance of catgut. When this stage is completed the thread is thoroughly washed and wound on large drums, and it is now ready for the next process—namely, that of carbonising. For this purpose special plumbago formers are used, round which the thread is wound, taking the looped form of the finished filament. The whole is then baked in special furnaces for several hours, becoming thoroughly carbonised, hard, and, to a certain extent, elastic. Work on the filament at Olympia begins here, with the first girl on the right-hand side of the stall, who receives the filaments in bundles and separates them out into a filmy heap. The next girl takes them up one by one, and after carefully gauging their diameter in a micrometer places them in different heaps, according to the size of lamp they will be suited for. After this follows the important process of joining up to the leading-in wires, which consists of platinum where they pass through the glass and copper where they are joined to the contacts. A mechanical joint is first made, being completed by an electrical one effected in the following manner: A piece of paste of a special nature is smeared on the joint, and the filament is then placed in a holder, being clamped in such a way that the joint forms part of an electrical circuit. The girl who performs this operation then drops the whole into a tank containing benzine, and by means of an adjustable resistance passes just sufficient current through the joint as to make it incandescent in the liquid. This results in a deposit of pure carbon on the joints, which are now finished.

Flashing is the next step, and the filament is placed in a bell jar filled with a hydro-carbon gas and incandesced, this process being continued until it is ascertained that the correct resistance has been arrived at. It is now ready for sealing in, a process which is conducted on the tube seal

Digitized by Google

principle—that is, the filament is first sealed into a small glass, which is then melted into the neck of the bulb. The exhaustion of the lamp follows, this being effected by ordinary mechanical pumps and finished by special pumps with pistons working in oil and giving a very high degree of vacuum. Tests of candle-power, electrical pressure, and current consumption are now made, and such lamps as do not come up to the standard are rejected, the remainder being passed on to the capping department, where the lamp is completed.

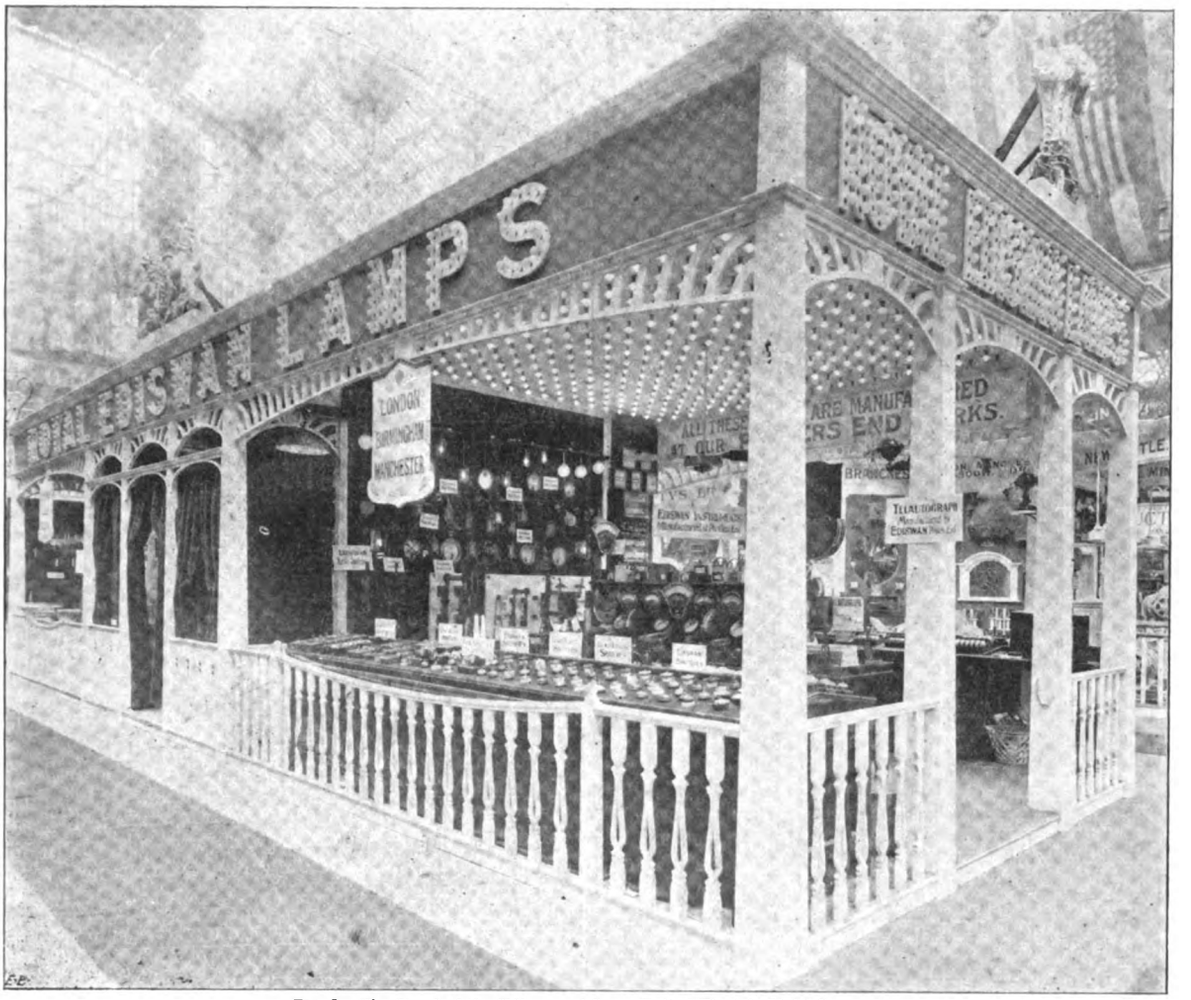

FIG. 5.—The Stand of the Edison and Swan United Electric Light Company.

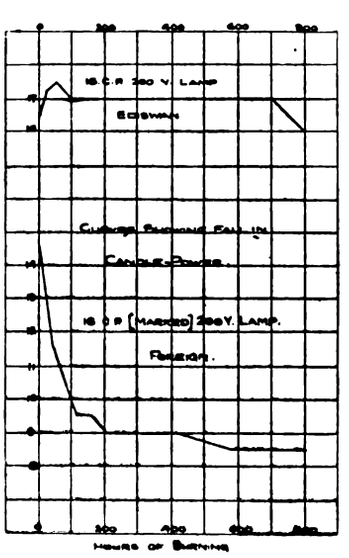

FIG. 6.

In all the above processes the most modern machinery and the greatest care are employed, both being necessary to maintain the high standard of the Ediswan lamp. Interesting comparisons of Royal Ediswan lamps with others of foreign manufacture are given in Figs. 6 and 7, which are self-explanatory. The tests upon which these curves are based were carried out by the Ediswan Company, who assure the writer that the contrast as shown in the curves is by no means extraordinary, but quite representative of the wide difference between the two classes of lamps. The latest product of the company is the lamp known as the Radiolite. It has a large spherical globe, the greater part of which is frosted in order to diffuse the light. The upper portion of the globe is clear, and above this is fixed an opal reflector which serves to throw downwards the light emitted from this part. The result is a largely increased downward candle-power and a soft diffused light. This class of lamp is both highly efficient and pleasing in appearance, and by virtue of such characteristics should command a good sale.

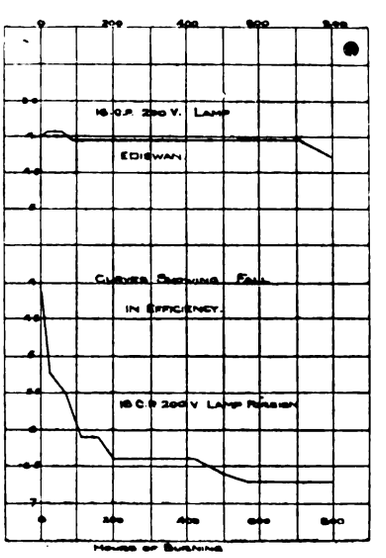

FIG. 7.

Digitized by Google

In a prominent part of the stall is an exhibit which demonstrates that, although not customary, it is possible to make a carbon-filament lamp with an efficiency equal, if not superior, to that of the tantalum lamp mentioned in a former section of this article. Two instruments, placed in circuit with tantalum and Ediswan high-efficiency lamps of equal candle-power, show by the aid of needles rotating over their respective dials that such a lamp is quite possible, and it is contended that, although the life is necessarily short, the wide difference in the prices of the two lamps counterbalances this, placing the carbon lamp on an equally economical basis as the tantalum. Whether such a contention is justifiable commercially can only be determined by exhaustive tests on high-efficiency lamps of this class, and in the absence of these it is impossible to look on the demonstration as conclusive.

Turning now from the modern to the ancient side of the Ediswan exhibit, one is confronted with some most interesting relics of the early days of electric lighting. The first Swan lamp, dating back to 1879, is shown, followed by examples of each successive stage of improvement and development. There are various forms of sockets and holders which will recall the past most vividly to many; and other exhibits, such as the first tumler switch, are equally as reminiscent. This part of the stand affords an excellent object lesson of what time and perseverance will do. Surrounded on every side by the latest improvements in incandescent lighting, the relics certainly have a somewhat shabby appearance, not to mention an old-world look. But their value is considerable both as relics and as moral examples, and the Ediswan Company are to be congratulated upon the possession of such a complete and interesting collection.

Before leaving the stand of the Ediswan Company some mention should be made of the interesting assortment of instruments there on view. They are particularly noticeable for their fine finish and for the obvious care which has been spent on their manufacture. The voltmeters and ammeters of the dead-beat moving-coil class are worth inspection, as they have some excellent features, including perfect screening and a high degree of accuracy. These instruments have no soldered joints, and are claimed to be entirely free from thermo-electric effects or contact E M F.'s, prolific although little recognised sources of error.

The Robertson lamp factory (Fig. 8) forms one of the chief attractions of the exhibition, a great part of the manufacture of these well-known lamps being carried out before an audience always large and appreciative. In 1893—a year after the Crystal Palace Exhibition—the Robertson Lamp Company started in quite a small way at Brook Green, Hammersmith, and by the early part of 1895 had succeeded in turning out *one* marketable lamp. This was the first and most important stage. It was essentially one of experiment; and small though the immediate results were, so satisfactory did these experiments prove that a lamp was evolved which admittedly stands in the highest rank, and is now being turned out from the greatly enlarged works at the rate of four millions per annum. The growth of the business from such small beginnings to its present size is due entirely to the care which is taken in every operation to produce a first-class article. This is obvious even at Olympia, where, naturally, conditions are not the most favourable, but at the works themselves it is even more apparent, the thoroughness with which every operation is carried out being particularly evident. A Robertson lamp in its making passes through 45 successive stages, a large percentage of which are tests of vacuum, efficiency, etc., carried out in order to make quite sure of the finished product. Starting from the purest of cotton wool, the filament passes through the usual stages. It is turned into cellulose by the action of chloride of zinc of a special gravity and temperature; it is squirted into a thread which is hardened by steeping in alcohol for three or four days; it is further treated for several hours with another solution of alcohol and acid in order to remove the last traces of the zinc chloride; and it is next washed for 24 hours in cold running water so

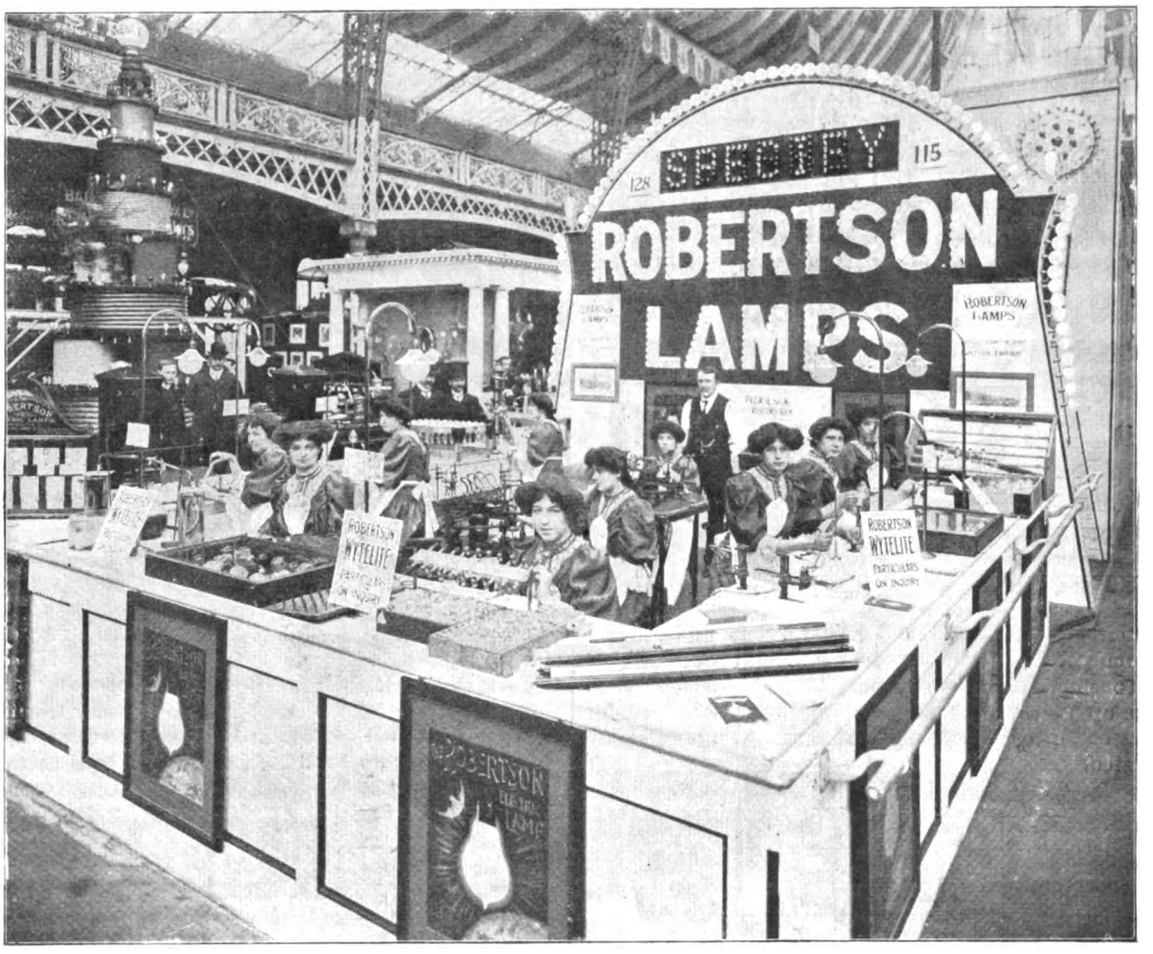

FIG. 8.—View of the Robertson Electric Lamp Company's Exhibit, showing Lamps in course of Manufacture.

Digitized by Google

that the last of the impurities may be carried away. Drying is done, as usual, in heated rooms on large drums which will carry half a mile of filament, and this is followed by carbonising in furnaces, the thread being wound on carbon formers. These are placed in plumbago pots, which are then subjected to gradually increasing heat for about 24 hours, the operation being completed by the removal of the pots to a still hotter furnace, where they remain until the fire has died down. The filaments are now cut, allowance being made for varying diameters, and the next process is that of mounting on the platinum leading-in wires, which is carried out in the usual manner, the joint being made both mechanically and electrically. Flashing in a thin hydro-carbon vapour derived from benzine follows, and this is continued until a Wheatstone bridge test discloses the fact that the filament is of the right resistance. By another system in use at the Robertson Works the regulation of the flashing current is effected automatically, being cut off in the same manner when the correct resistance has been attained.

This completes the filament, and the next step is to secure it in the globe. Both the "tube" and "pinch" seal methods are used, the latter exclusively for low voltages and the former for both high and low. In making a "pinch seal" great care is taken to secure perfect contact between the leading-in wires and the surrounding glass so that the vacuum shall not suffer, and a ridge with two crossed pieces is formed in order to secure the cap firmly. This latter device entirely overcomes the trouble of twisted-off caps, so prevalent with cheap foreign lamps. The filament being enclosed in the bulb, the exhaustion of the latter follows, being performed by a mechanical pump until what would ordinarily pass for a good vacuum is obtained. "Good," however, is not good enough, and the exhaustion is completed by Sprengel mercury pumps, with which it is possible to attain a very high degree of vacuum in about 20 minutes. Besides the mercury pump, another system of completing exhaustion is used, being nearly always applied to high-voltage lamps. After the mechanical pump has done all it can, the connection is sealed off and the filament is incandesced to a high degree. The heat evolved serves to disintegrate a certain chemical substance which has previously been placed in the connecting tube, causing it to turn into gas and rise into the globe, mixing with the residual air. It combines with this, and the two form a solid which sinks into the connecting tube, and it now only remains to melt the latter and detach it from the lamp. Even after this there are still some occluded gases in the filament and wires, and to ensure a perfect vacuum these too must be got rid of. This is done by what is termed "over-running"—that is to say, the filament is subjected to more than its right voltage, and the resulting extreme incandescence attains the desired end of getting rid of the occluded gases.

The important process of testing the quality of the vacuum is next carried out on the glow method by aid of an induction coil. If when the high-tension current is applied the bulb glows, the vacuum is bad and the lamp is thrown away. If, on the other hand, the exhaustion is satisfactory, the filament is then over-run to the extent of 50 per cent., with the express purpose of burning it out if weak, and should it survive, the lamp is again tested for vacuum. Then follows a long series of photometric and other tests, and whatever voltage the lamp is found to be suited for is at the same time marked on the bulb. Capping, by aid of a special cement, which when dry resembles marble, is the next step, and after still further tests for vacuum power to resist over-voltage, and general symmetry of shape, the lamp is cleaned, packed, and sent off. Approximately 33 per cent. of the lamps are rejected in the course of manufacture—a high figure, but one that speaks well for the thoroughness of the testing methods employed.

In common with other lampmakers, the Robertson Company are now manufacturing the partially-frosted reflector lamp which is becoming so popular. It is termed by them the "Wytelite," a name which is entirely justified by the excellent quality of the light obtained. The spherical bulb being devoid of the usual pip at the point where it is sealed off, the lamp does not cast shadows; and the correct placing of the filament, combined with the frosted globe and the opal reflector, results in a light which in whiteness and diffusion is much ahead of the ordinary incandescent lamp. The current consumption is the same as that of an ordinary 16-c.p. lamp, but the light obtained in the downward direction, where it is usually most needed, is equal to 25 c.p. The globe being spacious, does not blacken; and in many other ways the "Wytelite" lamp is an improvement over its more familiar predecessor. The back of the Robertson stand is lit by a large bank of these lamps, and the effect is very striking.

The osmium lamp and some of its general features were mentioned in a former section of this series. Further particulars are now to hand as to the manner in which the General Electric Company are applying them to practical use. The lamp they are showing in the gallery of the exhibition is termed the "Osmi," and this demonstration of its possibilities is well worth a visit and close inspection. The favourable points claimed as compared with the carbon-filament lamp are: approximately 56 per cent. saving of current and 56 per cent. less heat; longer life; minimum sensitiveness to voltage fluctuations; a white light; and inappreciable blackening of the globes. The average life of the "Osmi" lamp is given as not less than 500 hours, but, as before stated, this is often exceeded by a very large amount. Voltage fluctuations of as much as 5 per cent. or even 10 per cent. are hardly noticeable in the light, and the candle-power remains very steady throughout the whole life. It has been shown that these lamps at present can only be made for comparatively low pressures, and a 75-volt lamp is the highest that is being shown at Olympia. To overcome the difficulty, the General Electric Company are supplying adaptors which consist of two, three, four, or five lampholders fixed together and wired in series, and by this means the osmium lamp is made a commercial possibility where a high candle-power light from one point is required. The filaments of the higher-pressure lamps are naturally very long, and for this reason are supported at their lower extremities by wires sealed into the globe. The construction of the filament and its nature also prohibit the burning of the lamp in anything but a vertical hanging position, but it is conceivable that this difficulty will ultimately be got over.

The General Electric Company are making a very determined attempt to popularise the "Osmi" lamp, and have already booked several important orders, particularly for street-lighting. The lamp certainly has its limitations; it is comparatively dear and obviously unsuitable for many situations. On the other hand, for such work as street or hall lighting it would appear to possess very valuable features, and developments in this and similar directions may be confidently looked for.

In conclusion, the writer begs to acknowledge his indebtedness and express his thanks to the various firms who have supplied him with information for these articles.

CABLES FOR ELECTRIC DISTRIBUTION AT OLYMPIA.

[SPECIALLY CONTRIBUTED.]

(Continued from page 490.)

A list of the very numerous exhibits of insulated cables at Olympia would convey little information to our readers. The names, however, of the exhibiting firms remind the engineers used to cable work of the special points of the cables made by the firms in question. It is pleasing to note in this direction that the old-established cablemakers hold their own, and succeed in getting regular orders from those users who have proved the worth of their manufactures. Thus, on the stand of Messrs. Siemens Bros., which is on the left-hand side as one enters the exhibition, there are shown samples of the high-tension cables which have been supplied by the firm exclusively to the Bristol Corporation from 1893 to the present date. The Hull Corporation, again, have bought their high-tension cables from the firm from 1897 up to now. After such evidence it would be a bold engineer who would on general experience only dictate to Messrs. Siemens Bros. as to how they should vary their standard

Digitized by Google

design of high-tension cables. Of course, there are such bold engineers to be found, but the united efforts of the Cablemakers' Association tend to prevent them from doing much harm.

With the increase of pressure required for long-distance transmission the dielectric strength of the insulation has to be increased, and this has been successfuly accomplished. Cables for 10,000 volts working pressure, or samples of the same, are to be seen upon the stands of Messrs. Siemens Bros., the Callender Cable and Construction Company, Messrs. W. T. Glover and Co., Messrs. W. T. Henley's Telegraph Works Company, Limited, etc. This latter firm show a drum of 11,000-volt cable which has successfully withstood a testing pressure of 30,000, and supplied to the District Railway Company and the London United Tramways Company. The Western Electric Company show samples of the extra high-tension three-core cables supplied by them for the Baker-street and Waterloo Railway. With this high voltage the insulation on the cable itself has ceased to give experienced manufacturers any trouble. The insulation, however, of the joints where required, and of the ends, needs most careful attention. The joint boxes and accessories for end connections shown at Olympia are worthy of special study. Those shown on the stand of Messrs. W. T. Glover and Co. are specially designed to suit the extra high voltage above mentioned, and to provide against leakage of current over the surfaces of the insulation where a three-core cable is split up.

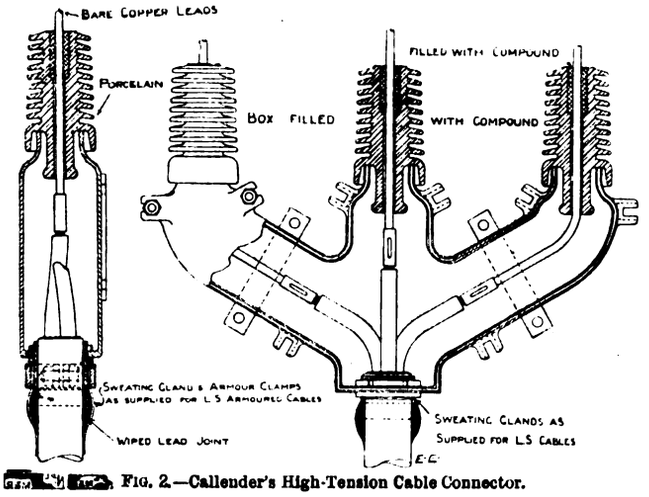

FIG. 2.—Callender's High-Tension Cable Connector.

In the accompanying illustration (Fig. 2) we show a three-way dividing box as made by the Callender Company for extra high-tension transmission work, in which a three-core cable has to be divided out into bare conductors at the generating or sub-station. One of the special features of this box is the design of insulator, which not only can be used for bare copper work, but, owing to the countersunk portion at the top, will take rubber or lead sheathed cables if the type of box is required to be used for this class of cable instead of bare copper. In such a case it would not be necessary to insure such a good porcelain insulation of the terminals, but it is useful to have a porcelain that is adaptable to any class of single conductor. This box, when jointed up, is filled with high insulation compound, and it will be noticed that when the box is filled the porcelain can be squeezed down into position without any mechanical joint, and yet with the assurance that, owing to the design of the bottom of the porcelain, the joint will be absolutely waterproof. This box is also made with an extra length attached to the bottom, so that in the event of circumstance requiring the box to be suitable for twisting the cores in any direction ample space is provided.

The same firm also show on their stand one of the pillars (Fig. 3) as supplied for the Tucuman system of overhead lighting and power distribution. At the top of the pole there are 12 sets of insulators, each set being for the three-wire system of overhead mains feeding out four ways from a street corner. Also, at the top of the pole, holes are drilled into which are inserted porcelain bushes, and through these holes rubber-covered cables are drawn up and connected to the bare overhead mains; the other ends of these rubbers are connected through porcelain bushed holes at the bottom of the pole to Callender-Ward fuse gear mounted on the double porcelain insulation principle. There are in the base of the pole four choking coils and four fuses, the arrangement being that the fuse controlling one of the outers of the three-wire overhead mains is placed in series with a choking coil, and this coil is arranged on porcelains at the back of the fuse. In the illustration reproduced only two ways of the overhead wiring were utilised, and, therefore, four fuses were required, but when the extension of the other two overhead ways is put into operation, the extra amount of gear will be shipped out and placed in position, as everything in the pillar designs is now so arranged that an extension can be made, when required, without the slightest difficulty by means of adding certain accessory pieces, the fixtures for

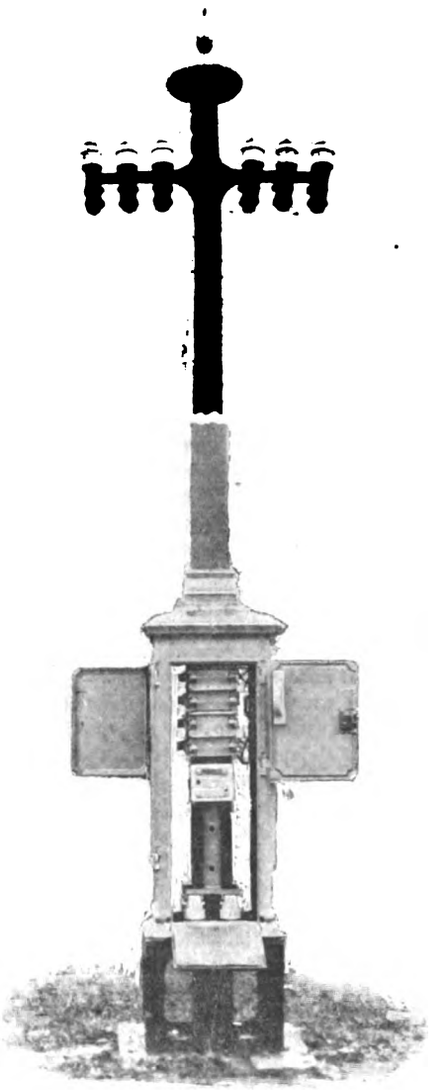

FIG. 3.—Connecting Box for Overhead High-Tension System.

which have been properly provided for in the first instance. There are also eight lightning arresters of the Wurtz type arranged for on the closed sides of the pillars, each arrester being attached to one of the choking coils.

Quite apart from the ordinary cables for laying in the streets, there has arisen a demand for special cables capable of withstanding special conditions. Amongst these is the fireproof class of cable, which is much needed in central stations where the bunching of each range of cable is sometimes unavoidable. Messrs. W. T. Henley exhibit numerous examples of such fire-resisting cables, and Messrs. W. T. Glover's have arranged a special test to show the efficacy of their fireproof coverings. This firm advocate the use of the cable in question for all fiery mines, and have also standardised a leather braided cable, which is specially valuable as a flexible connection in colliery work.

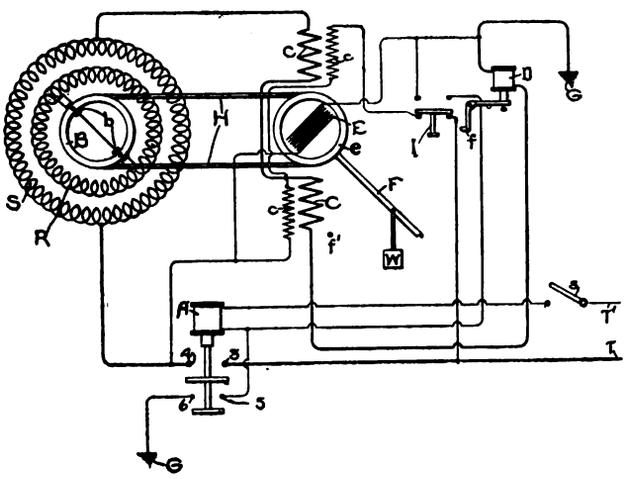
Of the plain indiarubber-covered wires for house wiring it is difficult to say much, as nearly all the large electrical

Digitized by Google

supply houses exhibit this useful commodity, without which electric lighting cannot be carried out in this country. The General Electric Company, Messrs. I. Frankenburg and Sons, Limited, Messrs. Falk, Stadelmann, and Co., Limited, and a number of other firms are showing extensively their standard insulated wires. There is a wide choice of good firms from which to purchase a reliable article. Unfortunately, there are also inferior cables on the market, which the new wiring contractors are tempted to patronise. They find in time that all is not indiarubber which bears the name, and, unfortunately, the consumer has to bear the brunt of their want of experience. In electric cables for any purpose whatever the best is cheapest, and the Olympia Exhibition clearly shows what a wide range of choice this maxim leaves to electrical engineers.

AUTOMATIC REGULATOR FOR ALTERNATING-CURRENT MOTORS.

A patent has been granted in the United States to Mr. G. H. Hill, of Schenectady, N.Y., for the purpose of automatically regulating the speed of a repulsion motor from stationary to full speed. It is noticeable that the torque of this type of motor may be varied by shifting the brushes which short-circuit the armature or rotor winding, and it will be seen from the accompanying diagram which we reproduce from the *American Electrician* that the inventor utilises this feature to accomplish his object. The stator winding is represented by S and the



rotor winding by R; the rotor winding is connected to a commutator in the usual way, but for simplicity this is omitted, and the brushes, *b*, are shown in direct contact with the winding. These brushes are mounted in a brush-holder ring, B, which is adjustable around the axis of the machine and is connected to a similar ring, *e*, by means of a belt, H, so that when the ring, *e*, is rotated the brush ring, B, follows its movement. The controlling ring, *e*, carries a coil, E, which is arranged in inductive relation to stationary coils, C C, the latter being in series with the stator winding. The polarities of the two sets of coils are such that when they are energised the coil, E, tends to turn counter-clockwise, which tendency is opposed by the weight, W, attached to the arm, F. The drawing shows the equipment as arranged for use on an electric car, so that the ground connections, G G, represent one terminal of the supply system; the main terminal of opposite polarity is the wire, T. When the apparatus is in position of rest, the arm, F, is raised to its horizontal position, where it is held by the latch, *f*; in this position it raises the bridge, I, and closes the circuit from the upper ground terminal through the solenoid A to supply source, T (when the switch, *s*, is closed), which is of the same polarity as the main supply terminal, T, but not necessarily of the same voltage. The switch, *s*, being closed under these conditions, current will flow through the solenoid A and the brush, I, to the ground connection, which is a common return for both supply sources. The solenoid A will then raise its plunger and bridge the contacts 3, 4, and 5, 6. The contacts 3, 4 close the torque circuit to the stator of the machine, and the contacts, 5 6 close the return connection between the solenoid A and the ground, so as to make the solenoid independent of the bridge, I. With the arm, F, horizontal the short-circuiting brushes on the rotor commutator are in the position of zero torque, and the motor, of course, does not start up. The magnetised current, however, through the stator winding passes through the solenoid D, which releases the latch, *f*, and allows the lever, F, to be drawn down by the weight. A shunt current passes from the main terminal, T, through the movable coil, E, to the ground, and this restricts the downward motion of the arm, F, and, consequently, the circular motion of the brush ring, B. When the arm, F, falls to a position where the magnetic pull of the coil, E, balances the weight, W, the brushes will have reached a position where the motor has sufficient torque to start up. As the motor speeds up and the counter E.M.F. in the stator winding increases, the current in the coils, C C, will decrease, allowing the weight, W, to pull the arm, F, still further down, carrying the brushes further around toward the point of maximum torque and increasing the speed of the motor still further. This will continue until the motor is running at full speed and the opposing forces in the regulator are in equilibrium. From the foregoing it will be evident that the regulators operate to produce practically a constant current flow through the stator winding of the motor. The regulator is provided with an auxiliary set of stationary coils, *c*, *c*, which are short-circuited when the plunger of the solenoid A goes up. When the switch, *s*, is open to shut the motor down the solenoid A is de-energised, of course, and drops its plunger, opening the two paths of contact. This removes the short-circuit around the auxiliary coils, *c*, *c*, and they then receive current from the main terminal, T, and through the bridge piece, I, this current passing to ground through the movable coil, E. The auxiliary coils and the movable coil, E, rotate the ring, *e*, raising the lever, F, until it is held in a horizontal position by the latch, *f*. In this position the bridge, I, is lifted from its bottom contacts, opening the connection between the main terminal, T, and the auxiliary coils, *c*, *c*.

FORTHCOMING EVENTS.

FRIDAY, OCT. 20.

Electro-Harmonic Society.—At 8 p.m., first smoking concert of the season in the King's Hall, Holborn Restaurant.

Institution of Mechanical Engineers.—At 8 p.m., "The Manufacture of Cartridge Cases for Quick-Firing Guns," by Colonel Leandro Cubillo.

WEDNESDAY, OCT. 25.

Tramways and Light Railways Association.—At 8 p.m., "Roller Bearings," by Mr. T. W. How.

FRIDAY, OCT. 27.

Institution of Electrical Engineers (Glasgow Section).—Fourth annual dinner at the Grosvenor Hotel, Glasgow.

Junior Institution of Engineers.—At 8 p.m. (at the Westminster Palace Hotel). annual general meeting and first meeting of the Incorporated Institution.

Institution of Civil Engineers.—Nov. 7, at 8 p.m., inaugural address by Sir Alexander Binnie and presentation of awards.

Rontgen Society.—Nov. 2, at 8.15 p.m., "Ruhmkorff Coil," by Prof. Wertheim Salomonson (of Amsterdam).

Birmingham Electric Club.—Nov. 4, at 7.30 p.m., "Electric Furnaces," by Mr. J. H. Stansbie.

New Publication. — "A Guide to the Electrical Examinations," by F. H. Taylor (London: Percival Marshall and Co. 1s. and 1s. 6d.). This handbook will be found useful to students, lecturers, etc, containing, as it does, a collection of information upon the electrical examinations of the City and Guilds of London Institute and the Board of Education, with a selection of examination papers and answers.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

Post Free, Payable in Advance.)

Bound Volumes of "The Electrical Engineer," *containing half-year's copies, bound in Dark-Blue Cloth, Gold-Lettered, price 8s. 6d. New Volume, January to June, 1906, now ready.*

EXHIBITIONS AGAIN.

Almost as soon as these lines are in print the 1905 exhibition will be closed. As far as we can gather, it has been pre-eminently successful, and the thanks of the profession should be given in no grudging spirit to the organising managers (Messrs. Bridges and Smith) and to the executive committee, but especially to the former, who have borne the burden and the heat of the responsibility, and perhaps to these we might add the names of the consulting engineers who have been assiduous in their efforts to make satisfactory arrangements for everyone. If we were disposed to attempt a classification of electrical exhibitions, we should place them under one or other of three categories, the present exhibition forming the single example under one head. There are exhibitions of an international character, in which educational purposes are put in the foreground, and business is openly tabooed; there are exhibitions of a local character to induce local support to local operations; and there is this last, incepted by manufacturers and organised for the general good of the industry. One of the greatest aims of every exhibition, whatever may be said to the contrary, is education—the education of people in the matter of progress. One of the most difficult things in the world is to educate the general public as to the value of new departures. Neither descriptive, illustrated articles, nor glaring advertisements will do as much as the seeing of a thing at work or in use. The world is very conservative. All the discoveries made within the last century were ridiculed and treated with contempt by our forefathers, yet we are equally prejudiced and hostile to all those improvements proposed to us which will in all probability be adopted by our children. A striking example of these statements is seen in the history of mechanical road traction. Proposed and tested three-quarters of a century ago, it was rejected till a half-century elapsed, when the idea was resuscitated, and is going along to success, notwithstanding the foolishly insane opposition to it even in these so-called enlightened days. Of course, there are some people who never learn. According to their own ideas, their knowledge is infinite and their actions perfect. They are really like the man who wanted to know how he looked when asleep, so sat before a mirror with his eyes shut; or the one who hoped to convince a possible purchaser of the value of his house by showing him one brick as a sample. The business man has at least three objects in life: first, he wants to know all about competitors' goods; he wants to produce something that will compete favourably with the products of his opponents; and, lastly, he wants to make as much money as he can out of his business. Properly organised exhibitions help him, directly or indirectly, in a position to provide for these wants. Business is not conducted for the pleasure of the thing, but with the very definite object of obtaining an income. Hence, while the aim is to obtain business, and as much as possible, it is quite as necessary to guard against excessive cost of obtaining it. The exhibitor at an exhibition is quite sure of the costliness of his proceedings, so he must try to minimise the cost and expand the return. At the meeting of manufacturers this week this point was discussed, and it was determined to minimise their costs at the many minor exhibitions held for local education. It is proposed that if promoters want exhibits, they must be prepared at least to pay the expense of carriage to and from the factory. This is quite fair, as, although business may result, it is by no means certain that the business will go to the exhibitor. The profession can now number in its ranks men of mature age and experience. In earlier days

Digitized by Google

youth held the helm, and scepticism has ever been the bugbear of youthful vanity. Even now—as ever—youth considers it knowing to quarrel with existing institutions and established truths, and this is well, because it means that things are more closely examined, and if experience guides and controls, the declamatory attitude leads to good. Thus the manufacturers in the plenitude of their wisdom organised the exhibition about to close, and have made it successful. They now recognise that this success will prompt others to repeat the exhibition for private gain, and have agreed not to support any such attempt. Their conclusions generally in the matter of exhibitions should be supported, in that they must for their own purposes have closely examined the *pros* and *cons.* of the case.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

HASTINGS TRAMWAYS.

SIR,—We observe in your issue of the 13th inst. that in your review of the Hastings power station you refer on p. 516 to the apparatus employed for purifying the condense water. You state, "a filter of the Wilson automatic self-cleansing type as supplied by Messrs. Masson, Scott, and Co." We consider this statement very misleading, as the filter in question was actually made and erected by ourselves (Wilskemp Limited, St. Ann's Engineering Works, St. Ann's-hill, Wandsworth, S.W.) to the order of Messrs. Davis-Perrett, Limited, 13, Fenchurch-avenue, E.C. We should be much obliged if you could see your way to insert a corrective paragraph to the above effect in an early issue of your journal.—Yours, etc.,

(For Wilskemp Limited) JAMES J. JACOB.

BOURNEMOUTH TRAMWAYS.

The completion of the tramways extensions connecting Bournemouth, Christchurch, and Poole was celebrated on Tuesday last, when Messrs. J. G. White and Co., Limited, the principal contractors, entertained the mayors of the three towns and numerous other guests at dinner. The combination of the conduit and trolley systems remains the most interesting feature of the completed scheme. Full details of this were given in our issues for Jan. 9, 16, and 23, 1903, about which time the central portion of the system was opened. The extension to Christchurch is on the overhead trolley system, the route length being 3½ miles and the total length of single track about 5½ miles. This is of entirely new construction, whereas the extension to Poole consists of a line recently purchased from a local company, except for a short section of new track linking this line with the Bournemouth system. The names of the various contractors for the original scheme need not be repeated here. Suffice it to say the British Electric Equipment Company, Limited, have carried out the overhead work for the extension lines; Callender's Cable and Construction Company supplied and laid the feeder cables; Messrs. J. G. White and Co., Limited, constructed the permanent way; and the Acme Flooring and Paving Company, Limited, did the wood paving. It is noteworthy in connection with the overhead work that a grooved trolley wire is used, whereby extra smooth running is ensured at the points of suspension. These extensions incidentally show what can be accomplished by co-operation between neighbouring authorities to provide facilities for intercommunication, and may portend further developments of a like nature. Now to Tuesday's doings. Several gaily-dressed cars were run through from Bournemouth to Christchurch in the early afternoon, and, the weather being of the district's best, the outing proved most enjoyable. Later on a reception was held by the Mayor of Bournemouth, Alderman J. Elmes Beale, in the Winter Gardens. Then came the principal event of the day—namely, the banquet, at which Mr. J. G. White presided. This was given at the Grand Hotel, and was quite Carltonian in style. The work of Messrs. J. G. White and Co., as principal contractors, could scarcely have been more highly eulogised than it was during the subsequent speeches. Mr. J. H. Rider, in proposing "The County Borough of Bournemouth and the Tramways Undertaking," struck the keynote by an apt reference to the excellent work carried out by this company for the London County Council. Referring to the working of the Bournemouth tramways, Mr. Rider said the receipt of 1s. per car mile run signified one of two things—either that too few cars were employed, or that the residents used the cars to an extraordinary extent. He believed the former explanation to be the true one. The Mayor of Bournemouth and the chairman of the Tramways Committee (Alderman Lawson) both responded to this toast. They were equally insistent on the praise due to Messrs. J. G. White and Co., Limited, both for the excellent quality of their work and the expedition with which it had been carried out. Incidentally the Mayor remarked upon the esteem in which the company's employés were held by the residents along the Christchurch route. He also referred to the splendid services rendered by the borough engineer, Mr. F. W. Lacey, and the resident electrical engineer, Mr. Bulfin, in connection with the undertaking. The toast of "The Other Contractors" was proposed by Mr. A. N. Connett, and responded to by Mr. T. Callender.

It must be remembered, in adjudging the value of the complimentary remarks made on this occasion, that the central and by far the larger portion of the Bournemouth system of tramways has now been in operation for nearly three years, during which time the quality of the work has been proved under service conditions. The success of the conduit in Bournemouth is, of course, primarily due to Mr. A. N. Connett, who was responsible for the details, and is all the more noteworthy because the town was the first in this country to adopt a mixed trolley and conduit system. It must be acknowledged that Messrs. J. G. White and Co. have established a standard for work in this and other countries which for downright thoroughness need fear no comparison.

THE TRANSMISSION OF POWER BY ALTERNATING CURRENTS.

BY ALFRED STILL, M.I.E.E., A.M.I.C.E.

(Continued from page 492.)

In comparing three-phase with single-phase transmission *on the basis of the same maximum potential difference between wires*, we have for the total three-phase power

$$W = \sqrt{3}\, E \times C,$$

which for equal power single-phase would be written

$$W = E \times (\sqrt{3}\, C).$$

Let r = the resistance of each conductor on the three-phase system, and

r_1 = the resistance of each conductor on the single phase system,

then *weight of copper, single-phase* $\propto 2 \times \frac{1}{r_1}$,

and *weight of copper, three phase* $\propto 3 \times \frac{1}{r}$,

and the ratio $\frac{\text{weight of copper, single-phase}}{\text{weight of copper, three-phase}}$ may be written

$$\frac{2\,r}{3\,r_1},$$

but for equal line losses we have

$$3\,C^2 r = 2\,(\sqrt{3}\,C)^2 r_1,$$

which gives us $r = 2\,r_1$.

Hence the relative weights of copper are as 4 : 3, showing a saving of 25 per cent. in favour of the three-phase system.

Digitized by Google

Effect of Inductive Load on Line Losses.—We shall still neglect the capacity or self-induction of the lines, but briefly consider the effect of an inductive load on the vector diagrams. In Fig. 20 the diagram has been drawn for the condition of a power factor of unity.

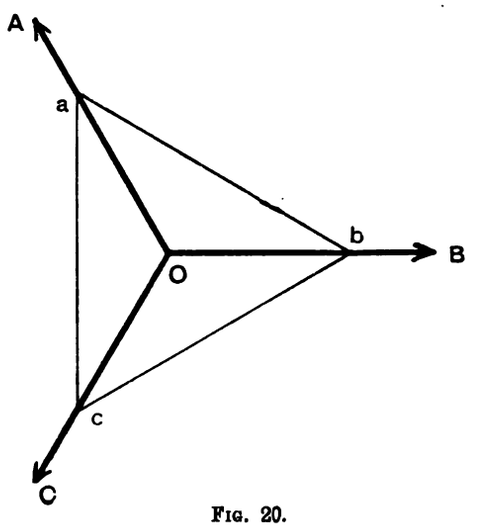

FIG. 20.

Here O A, O B, and O C are the three current vectors. The potential difference between wires is $a\,b = b\,c = c\,a = E$.

The length $O\,a = O\,b = O\,c = e = \frac{E}{\sqrt{3}}$.

The total power is: $W = \sqrt{3}\ E \times C$

$= 3\,e \times C$

$= 3\,(O\,A \times O\,a)$.

In Fig. 21 the diagram has been drawn for an inductive load. Here there is a certain displacement of the current phases relatively to the E.M.F. phases. It will be noticed that the vertices of the E.M.F. triangle no longer lie on the current lines as in the previous diagram. The three current vectors still make the same angle of 120deg. with each other, but they have been moved bodily round (in the direction of retardation) through an angle θ. The

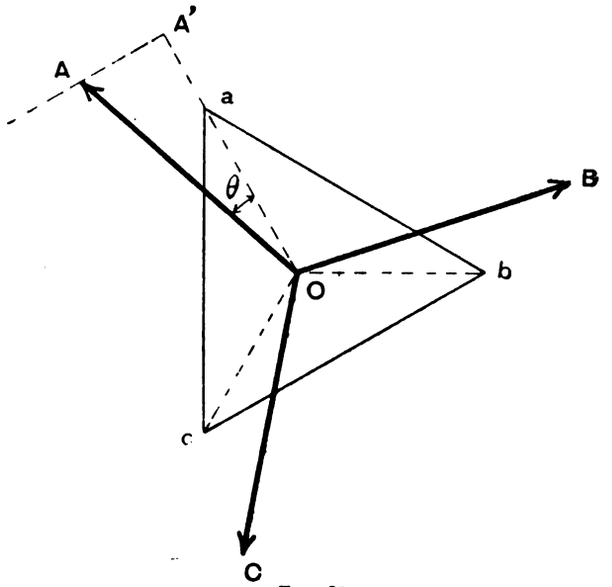

FIG. 21

total power is, evidently, no longer equal to three times $O\,A \times O\,a$, but to $3\,O\,A' \times O\,a$, where O A' is the projection of O A on O a; and cos θ is the power factor of the three-phase circuit.

It was explained in connection with single-phase currents that, for a given total power to be transmitted at a definite pressure, the weight of the conductors—if the $C^2\,r$ losses are to remain constant—must vary inversely as the square of the power factor. This rule necessarily applies equally to the case of three-phase transmission. Thus, in Fig. 21, the power factor, cos θ, is expressed by the ratio $\frac{O\,A'}{O\,A}$, but, if the *power* and *pressure* are constant, the length O A' will not alter, whatever may be the power factor. Hence O A (the current in any one of the wires) will vary inversely as the power factor, and—for a given loss in the line—the cross-section of the conductor must vary as the square of the current—*i.e.*, *inversely* as the square of the power factor.

It is not necessary to complicate the diagram Fig. 21 by drawing the vectors showing the effect of the resistance drop in displacing the E.M.F. phases at the receiving end relatively to those at the transmitting end. The construction is exceedingly simple, and can be carried out for each phase exactly as in the case of Fig. 2. We have merely to bear in mind that O A and O a in Fig. 21 correspond with O C and O E' in Fig. 2. The result will be an E.M.F. triangle representing the necessary pressures at generating end, which will be similar to but somewhat larger than $a\ b\ c$, and of which the phase displacement angle, ϕ relatively to the current vectors will be *smaller* than the angle, θ, at receiving end. In fact, the conclusions drawn from Fig. 2 as applying to single-phase transmission will apply equally to the case of three-phase transmission—that

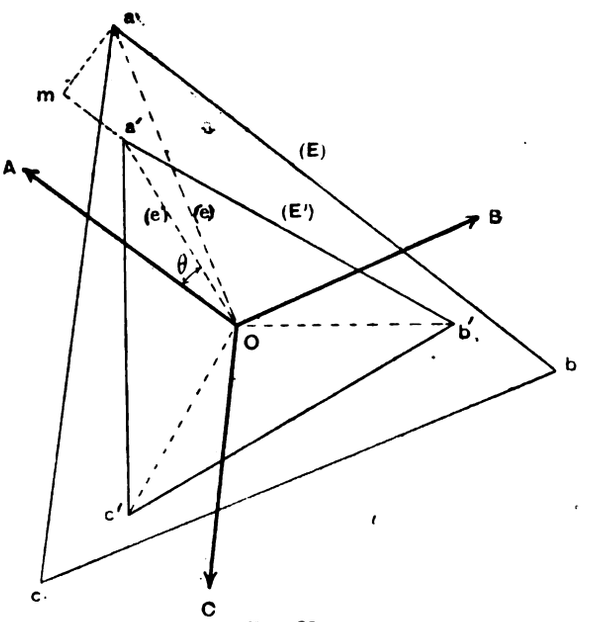

FIG. 22.

is to say (1) the power factor at generating end is greater than at receiving end; (2) *for a definite percentage $C^2\,r$ loss in the conductors*, the arithmetical difference in the pressures at the two ends of the line will *diminish* as the load becomes more inductive. It must not be forgotten that these conclusions refer to a line of negligible self-induction and capacity.

Self-Induction of Three-Phase Lines.—The arrangement of three-phase overhead lines is generally such that the wires occupy the vertices of an equilateral triangle. Under such a condition, it is evident that the magnetic flux due to one of the wires will neither increase nor decrease the amount of the induction through the loop formed by the other two wires. As a matter of fact, if the three wires are arranged in any other practical manner, the effect of the induction due to any one wire on the loop formed by the other two wires will be found to be negligible.

It will be remembered that, when dealing with two-phase transmission with common return, it was shown how the total induction in any one loop may be considered as the resultant of two separate fields—one due to the current in the common return, and the other due to the current in the outer wire—combined at an angle of 45deg. In a three-phase circuit the currents in the three wires are equal, but they differ in phase by 120deg. If, therefore, we calculate, by the help of the curve (Fig. 4), the induced E.M.F. on the assumption that each wire produces its own flux of magnetism independently of the other wires, we have merely to combine two such E.M.F.'s in the manner

Digitized by Google

previously indicated (see Fig. 19) to obtain the total E M.F. in any one of the three loops. This is evidently $\sqrt{3}$ times as great as the induced E.M.F. calculated for the current in one of the wires only.

By far the simplest way of constructing the vector diagrams for three-phase circuits is to consider the three phases independently, and Fig. 22 shows the effect of taking into account the self-induction and ohmic resistance of the lines. Here A, B, and C are the current vectors, and a' b' c' is the E.M.F. triangle for the receiving end, the angle of lag being θ. Consider O A and O a' as being the current and E M F. vectors of a single-phase circuit. Draw a' m parallel to O A to represent the ohmic drop due to the resistance of one conductor, and m a, at right angles to O A, to represent the necessary impressed voltage to balance the E.M.F. of self-induction, on the assumption that the magnetic field is due solely to the current, O A, in one conductor. Join O a, and note that, so far, the construction is exactly similar to that adopted in Fig. 3 for a single-phase circuit. We have merely to suppose the same construction to be followed in the case of the other two phases, and the result is the triangle a b c, which represents the necessary three-phase applied E.M.F. at the generating end.

The conclusions drawn from the diagram Fig. 3 when treating of single-phase currents are equally applicable to the case of three-phase transmission. Assuming the distance between the wires to be the same for a three-phase as for a single-phase transmission, let us see whether either system has an advantage over the other from the point of view of inductive drop. In the first place, the total power delivered on the three-phase system (see diagram Fig. 22) is

$$3 \text{ O A} \times \text{O } a' \times \cos\theta$$
$$= 3 \text{ C} \times e' \times \cos\theta$$
$$= \sqrt{3} \text{ C} \times \text{E}' \times \cos\theta$$

where C = the current in any one conductor, and

E′ = the pressure between wires at receiving end.

In a single-phase system supplying the same power at the same pressure between wires, the current is, therefore, $\sqrt{3}$ times as great. The inductive drop in one of the three-phase *loops* is proportional to C × $\sqrt{3}$, and exactly equal to the inductive drop due to each of the single-phase *wires*; hence if the diameter of the wires were the same in

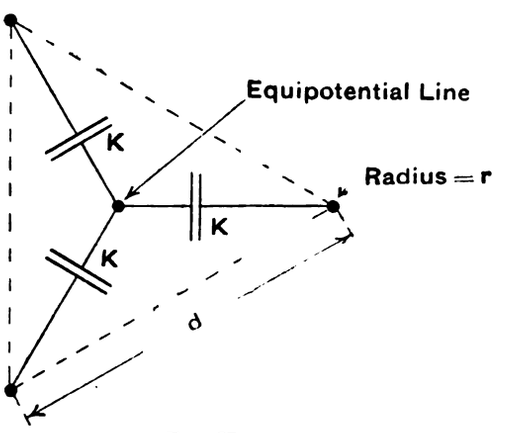

FIG. 23.

both cases, the inductive drop in a three-phase line would be only *half* that in an equivalent single-phase line. As a matter of fact, the diameter of the conductors in the single-phase line would be greater on account of the larger current, and has the effect of *reducing* the self-induction on the single-phase line by something under 10 per cent.

Capacity in Three-Phase Transmission Lines.—In their paper read before the American Institution of Electrical Engineers in 1900, Messrs. Perrine and Baum showed that the capacity of a three-phase line with the wires arranged in the form of an equilateral triangle may be considered as being made up of three equal capacities, all measured between any one wire and the line of zero potential, which may be taken as a line passing through the centre of the triangle. The three capacities are shown diagrammatically in Fig. 23. The capacity of each of the three imaginary condensers shown in the diagram is given as

$$\text{K} = \frac{\cdot 0388}{\log_{10}\frac{d}{r}}$$

where K = the capacity *per mile* in microfarads

d = the distance between wires;

r = the radius of any one wire.

It follows that the capacity current per conductor can readily be calculated exactly as explained in connection with single-phase transmission, the condenser E M.F. being taken as the pressure between the wire and neutral line, which is equal to $\frac{1}{\sqrt{3}}$ times the pressure between wires. This method of calculating the capacity effects on a three-phase line is very simple and convenient; it is evidently based on the assumption that the influence of the earth may be neglected, and this assumption is probably justified if the distance between the wires is small as compared with their height above ground.

The effects of capacity are not usually very great on overhead lines, but, in the case of long lines, transmission at light loads may become difficult, if not impossible, and if this should be the case some means of neutralising the capacity may have to be adopted. Suitable choking coils might be connected between the wires at intervals along the line, or, if power is supplied through induction motors at intermediate stations, there may be no need of any special appliances to introduce additional self-induction.

The formulæ for the capacity of three-core cables with lead coverings are not so simple as for overhead wires, and information regarding the amount of the capacity current to be expected in a given type of cable should be obtained from the maker.

(To be continued.)

THE RELATION BETWEEN CURRENT AND VOLTAGE IN THE ALTERNATING ARC.*

It is usual to consider the behaviour of a conductor carrying a current as characterised by a constant relation,

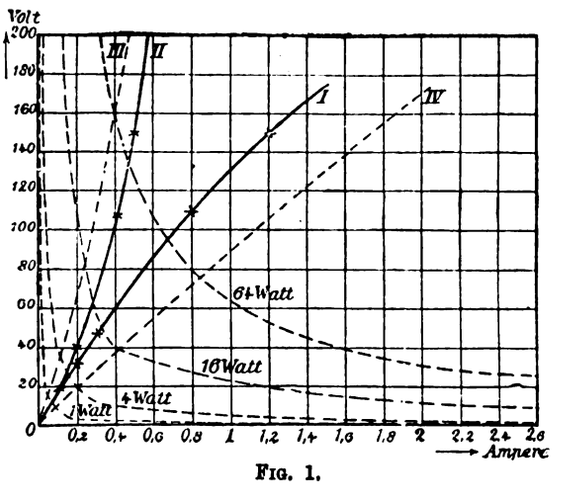

FIG. 1.

called the resistance, between the voltage applied and the current flowing, or, in the form of Ohm's law, $i \times r = e$. The simplicity of such a consideration has led to its application in cases where its value and even its meaning are more or less lost. This has been especially the case in connection with recent advances, and it has gradually become clear that for many cases Ohm's law must be considered as only an interpolation formula holding within certain limits, and that for the complete definition of the behaviour of a conductor its experimentally determined characteristic curve connecting current and applied voltage is required. In some special cases this curve can be

* Abstract of an article by H. T. Simon in the *Physikalische Zeitschrift* and in *Elektrotechnische Zeitschrift* Aug. 31, 1905, and Sept. 7, 1905.

Digitized by Google

expressed by a simple formula such as Ohm's law, and in these cases the usual analytical treatment is best, but more generally the curve is a complicated function of the current. Characteristic curves have long been employed for dynamos and accumulators because these first showed the insufficiency of Ohm's law, and more recently the passage of currents through gases, and through carbon-filament, tantalum, and Nernst lamps, has been successfully treated by means of such curves. Thus, in Fig. 1, Curve I. is the characteristic of a carbon-filament lamp, and Curve II. that of a tantalum lamp. By adding the ordinates of these two curves at various currents Curve III. is obtained, which is, therefore, the characteristic curve of the two lamps in series. By adding the abscissæ of the two curves together at various voltages, Curve IV. is obtained as the characteristic of the two lamps connected in parallel. It will be seen that Curve IV. is practically a straight line from the origin, and, therefore, represents a combination whose resistance is independent of the current.

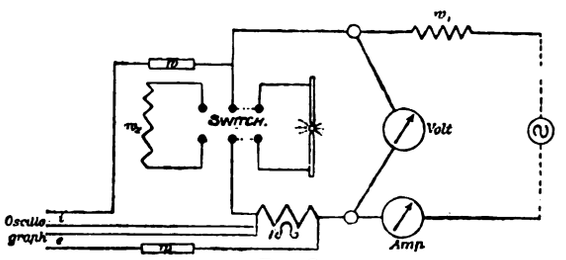

FIG. 2.

By suitably varying the lengths of filament in the two lamps the series characteristic (Curve III.) could be made a straight line. The dotted hyperbolas shown in Fig. 1 indicate the total watt consumption at each point. In the same way such curves can be made to indicate whether a given combination is stable under given conditions, and many other interesting points.

They are especially useful, however, in connection with the electric arc. The behaviour of the arc depends on a large number of variables, such as the length of the arc, the material of the electrodes, nature, temperature, and pressure of the surrounding gas, the heat conductivity of the electrodes and of surrounding objects, etc. Mrs. Ayrton and other observers have determined what may be called the "static characteristic" of the arc by step by step measurements of voltage and current, the voltage being gradually adjusted by means of a regulating resistance, and have shown that it obeys the law $e \times i = a + b\,i$ for currents varying from two amperes upwards, a and b being experimental constants. The action at very small currents has not been investigated. The data at present available

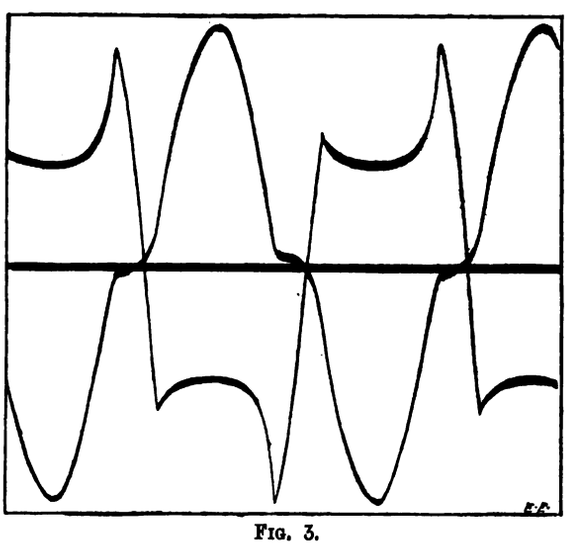

FIG. 3.

would seem to indicate that the temperature of the electrodes, especially of the negative electrode, has an all-important effect on the behaviour of the arc, so that the higher this temperature the greater is the current flowing at a given volage. The nature of the electrodes, as well as the quality of the surrounding gas, would, however, seem to have an additional independent effect.

A method which lends itself especially to the study of the electric arc consists in taking what may be called its "dynamic characteristic"—*i.e.*, taking simultaneous instantaneous values of voltage and current when the current is varying periodically. Voltage and current curves of an alternate-current arc have often been taken—*e g*, by Blondel and by Duddell—but the results do not appear to have been used systematically for the construction of the characteristic curve. The present writer has made some interesting experiments in this direction on the alternate-

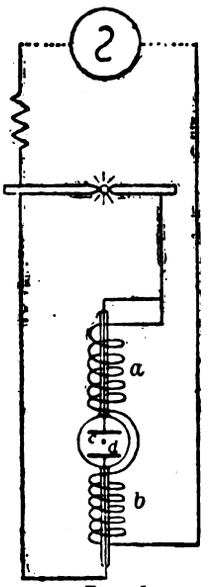

FIG. 4.

current arc, and has employed two distinct methods for the purpose: (1) The curves of current and voltage of the arc are taken simultaneously by a double-strip oscillograph, connected as in Fig. 2. By means of the reversing switch shown the arc can be replaced by a known resistance, w_2, for the purpose of

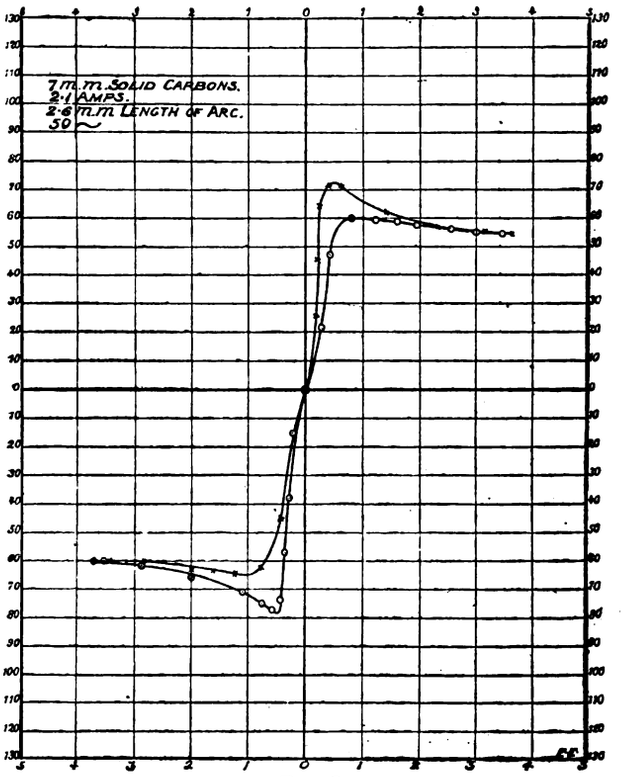

FIG. 5.

checking the oscillograph calibration. Curves of the type shown in Fig. 3 were thus recorded on squared paper, and from the corresponding values of volts and amperes the characteristic curve was deduced. (2) The second method consisted in drawing the dynamic characteristic direct on a

Digitized by Google

fluorescent screen by means of a Braun cathode tube. The tube was arranged as in Fig. 4, the current of the arc being sent through the coils, *a b*, producing a horizontal deflection of the cathode rays proportional to the current, whilst the electrodes, *c d*, were connected across the arc and produced a vertical deflection proportional to the voltage. In this way the cathode stream occupies a point on the dynamic characteristic at every instant, and, if the periodicity is

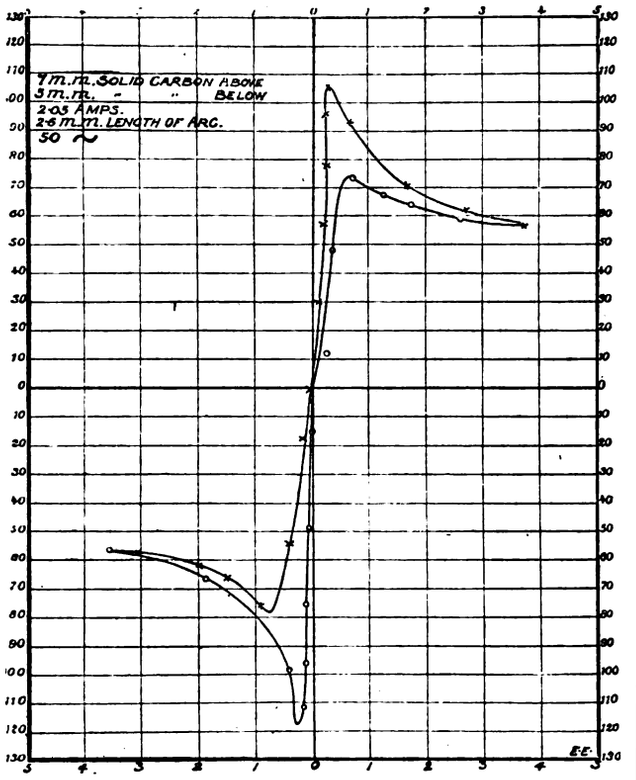

Fig. 6.

high enough, the whole curve appears fixed on the fluorescent screen. This latter method is not confined to low frequencies, as in the case of the oscillograph, and so can be employed in determining the characteristics of electrical resonance discharges and the like.

The type of curve obtained from an arc is shown in Figs. 5, 6, and 7. The crosses represent the curves for rising currents and the circles the curves with falling currents. These two curves are always different, and the cause of this difference the writer proposes to call the hysteresis of the arc. The analogy between the results and the effect of magnetisation in iron is, in fact, very close, and the action of the arc circuit is very similar to that of a magnetic circuit containing an air-gap. Whether

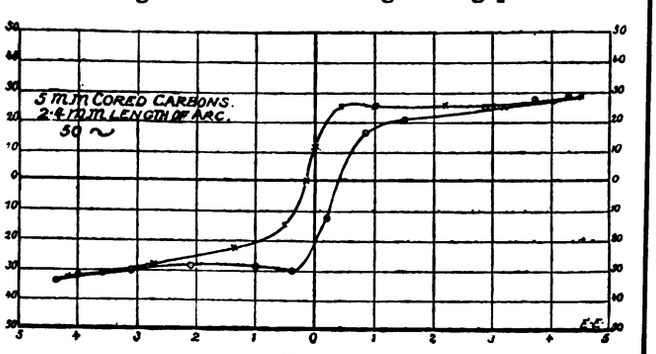

Fig. 7.

the quantities corresponding to residual magnetism and to coercive force actually exist, or are only due to experimental errors (which would reach their maximum values just at those parts of the curve), the writer hopes to decide definitely by further experiment. It is possible that the effect corresponding to residual magnetism—*i.e.*, the fact that an E.M.F. exists when the current is zero—may be a thermo-electric effect due to differences of temperature between the two electrodes, such as occur with vertical carbons due to the rising streams of hot gases. The dynamic characteristic curves are affected by the length of arc, quality of electrodes, and all the other variables which affect the static characteristic. Thus the five characteristics in Fig. 9 (calculated from the volt and ampere curves in Fig 8) show the effect of increasing the length of the arc with a constant supply voltage (maximum instantaneous value = 200), constant steadying resistance, and constant periodicity. The sloping straight lines are the steadying resistance lines—*i e*, the tangent of the angle they make with the horizontal is equal to the amount of the steadying resistance in ohms, so that heights from the 200-volt line to this resistance line represent the volts lost in the steadying resistance at each value of the current. It will be seen that for very short arcs (*a* and *b*) the falling branch of the characteristic is above the rising branch. This is probably due to the influence of the air currents which, in Mrs. Ayrton's tests, were found to produce a hissing arc under the same conditions.

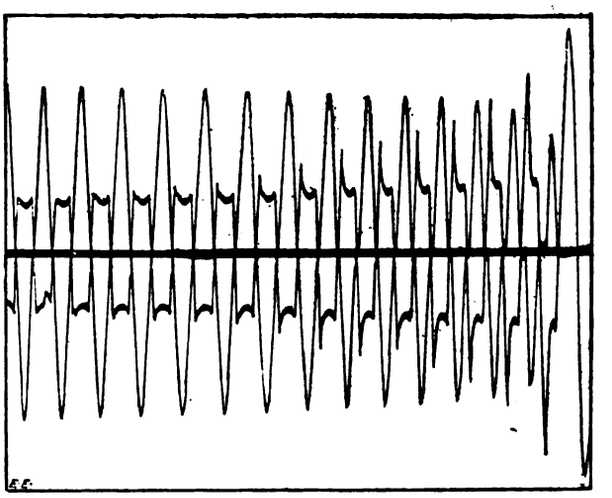

Fig. 8.

The effect of varying the steadying resistance is shown in Fig. 10. The four curves are obtained from a test made with a constant length of arc of 3mm. and a voltage whose maximum value was 200, the steadying resistance being rapidly increased whilst the oscillograph record of volts and amperes was being taken on a moving film. It will be seen that as the maximum current falls—*i e.*, as the steadying resistance rises—the maxima of both rising and falling characteristics increase, but the rising curve much more rapidly than the falling one. The maxima also occur at smaller and smaller current values. The hysteresis rises with falling maximum current value. Extinction of the arc occurs as soon as the maximum of the rising characteristic reaches above the resistance line. Tests were also made with a falling frequency, and showed that both rising and falling characteristics increase their voltage maxima with falling frequency, but the former more rapidly than the latter, so that the hysteresis increases with falling periodicity. The currents at which the maximum voltages occur get smaller as the periodicity falls, and extinction of

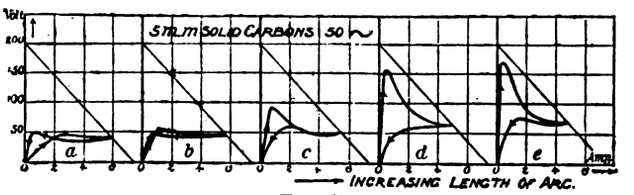

Fig. 9.

the arc again occurs as soon as the rising characteristic exceeds the resistance line.

On the basis of the ordinary ionic theory of discharges in gases, the following explanation of the electric arc may be given: In the ordinary state of the surrounding gas only a few ions are present, so that even with a high applied voltage a very small current only can pass. As the voltage is increased a value is eventually reached at which the existing ions attain so great a kinetic energy that they are able to ionise the neutral molecules by colliding with

Digitized by Google

them. The conductivity and the current accordingly increase whilst the voltage falls, and what is known as the glow discharge takes place. Up to this point it is only the ions of the gas itself which carry the discharge. With increasing current the gas path as well as the tips or craters of the electrodes warm up to a degree sufficient to produce a balance between heat energy supplied and heat energy emitted. Eventually glowing of the electrodes occurs, and the negative electrode begins to set an appreciable number of electrons free. These give increased ionisation and increased current at lower voltage, so that evaporation of the electrodes commences, and this vapour then carries the discharge. The increasing current finally becomes limited by the steadying resistance in use. When the discharge takes place in the electrode vapour, the ordinary conditions of the electric arc exist.

Of the energy used in the arc (volts × amperes), by far the greater part is used at the positive and negative electrode surfaces. This energy determines the temperature and the surface of the two craters, whilst, on the other hand, the crater surface and the length of the arc determine the voltage required for any particular current value. As soon as the point is reached at which the negative electrode commences to vaporise, as described above, increase of current no longer increases the temperature, but only the surface of the negative crater. So long as the negative crater is small, a small increase in current produces a large percentage change, and it is on this account that the characteristic falls away so suddenly after the voltage maximum, when the negative electrode is white hot. The positive crater has a similar though much smaller effect, for this crater, owing to the greater fall of potential at the anode, has a greater surface than the negative crater even at small currents. The difference in the effect of the two craters is further accentuated by the important action of the negative crater as the source of the ionising cathode stream.

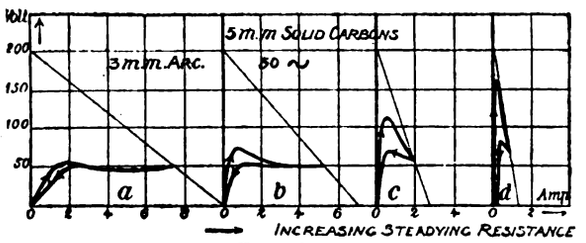

Fig. 10.

From the above considerations it is clear that the principal determining factor for the voltage required for a given current may be considered as the product, T F, of the temperature, T, and surface, F, of the negative crater. All the other factors, such as drop of potential at anode, surface of positive crater, fall of potential in the gas column, etc., are included in this product T F. It is immaterial how the value of this product is produced—*i.e.*, whether by the passage of the current itself or through externally applied heat. At ordinary atmospheric temperatures a considerable voltage must be applied before a sufficiently high T F is reached to set free an appreciable number of electrons. When once this point is reached, a comparatively low voltage is sufficient to give the high value of T F required for the maintenance of the arc. The value of T F does not depend simply on the product of volts and amperes, but also on the relation between the energy supply and the energy dissipation through conduction, convection, and radiation. Of these, the dissipation through conduction is by far the most important. The current develops a heat energy equal to $e \times i$ in unit time, while a certain amount of energy, W, is dissipated per unit of T F in unit time. These two amounts must be equal, so that $e \times i = W\ T\ F$ or $T\ F = \frac{e\ i}{W}$. For a given amount of energy supplied, T F becomes lower the quicker the heat is dissipated from the crater surface, so that in the case of the static characteristic of the arc the voltages are higher, and the maximum voltage occurs at a higher current, the greater the facilities for heat dissipation.

When the supply of energy is variable instead of constant, there is an alternate storing up and giving out of energy by objects surrounding the arc—these objects acting as a secondary source of energy. The equation for this case may be stated as

$$e\,i = (W\ T\ F)_t + L\left[\frac{d\,(T\ F)}{d\,t}\right]_t,$$

where L is a constant depending on the density, specific heat, and heat conductivity of the electrodes and the surrounding air. The index t indicates that the instantaneous values of the various quantities are used. By the aid of this expression the writer determines the dynamic characteristics for various practical cases from the known or assumed static characteristic, and shows that the calculated effects of changes of steadying resistance or of periodicity on the characteristic agree well with the experimental results. He is further able to give simple explanations of other well-known effects, such as the valve action of a carbon-metal arc, the difficulty of maintaining an alternating arc between metal electrodes, the difficulty of measuring the "true resistance" of a direct-current arc by superposing an alternating current through it unless excessively high frequencies are used (Duddell, *Proc.* Roy. Soc., 68, p. 512, 1901), etc.

An important bearing of the arc "hysteresis" on the production of Duddell's singing arc is also pointed out, and the writer hopes shortly to publish a theory of this phenomenon based on oscillographic experiments.

PERSONAL.

Mr. A. J. Fraser, electrical engineer to the Nelson Corporation, has resigned.

The Doncaster Town Council have increased the salary of the electrical engineer, Mr. Rayner, by £50.

Mr. Charles E. Gray has been appointed electrical engineer to the Ross Electric Light and Power Co., Ross, in place of Mr. A. P. Lumsden.

The Heywood Town Council have granted the electrical engineer, Mr. James Scott, a sum of 50s. to distribute for extra work performed by his staff.

It has been decided to appoint Prof. Fitzgerald electrical inspector for the city of Belfast from June 16 last at a salary to be named by the Board of Trade.

Mr. N. Gunz has resigned his position of secretary of the General Electric Co., and has established himself as manufacturers' agent at 46, Queen Victoria-street, E.C.

THE INFLUENCE OF ELECTRICITY ON POWER ENGINEERING.*

BY W. B. ESSON, M.I.C.E., M.I.E.E.

(*Concluded from page 532.*)

Up to the present I have referred to hydro-electric plants only, and it is not easy to estimate the total of the water power which has been utilised all over the world by their erection. The tribute under which Niagara River has been laid for power supply has been already cited, and I believe I am well within the mark in placing the total capacity of the hydro-electric power-houses at work and under construction on the American continent alone at a million horse-power. In Italy, Lombardy alone accounts for 88,000 h.p. in hydro-electric power-houses at work and under construction, while Switzerland, the home of hydro-electrics, accounts for 220,000 h.p. Taking the whole world, the water power utilised in the hydro-electric stations must lie somewhere between a million and a half and two millions of horse-power—a vast force the greater part of which might have run to waste for all time had it not been for the invention of the dynamo.

All these schemes cannot be placed in the same category. Cases are numerous in which electricity is employed merely as a means whereby the power of water can be conveniently parcelled out to various industrial undertakings in the immediate neighbourhood. Such cases furnish an example of power distribution rather than of power transmission. The work is brought to the power, and the enterprise is of a kind differing entirely from those in which the power must be transmitted over a considerable distance, and in

* Presidential address to the Civil and Mechanical Engineers' Society, delivered Oct. 5, 1905.

Digitized by Google

which by no possibility could the work ever be brought to its source. As furnishing a case of the former kind Niagara may be cited. The supply of cheap electrically distributed power has been the means of founding a most important industrial district and of increasing land values to a large extent. There is no doubt that here, though distance does not come in so much, electricity furnishes by far the best means of power distribution, but several other means have been proposed, and an altogether different problem is that of transmitting power to a distant region practically inaccessible so far as fuel is concerned on account of the enormous cost of transit. The works in the immediate neighbourhood of Niagara use about 60,000 h p, and their demand continues all the year round without ceasing, the greater portion of the power being used for metallurgical and electro chemical processes in the form in which it is received. The Niagara industries present the case of Mahomet going to the mountain, but amongst the cases of the mountain taking itself to Mahomet the transmission to the Kolar goldfield at Mysore already referred to furnishes a very good example. For years prior to 1899 the project of utilising the falls was discussed, but as often was it abandoned because of there being no local market for the power and no prospect of any industries being tempted to the district. But the falls were there with their huge power running to waste, and the Kolar goldfield was but 92 miles distant. Fuel in the mines was excessively dear, while the possibility of transmitting the power economically to great distances had been demonstrated in the case of other undertakings. The problem of utilising the power was in 1900 again taken up with all the knowledge which had been gained elsewhere brought to bear on it, and an enterprise is in full swing to-day by which 4,000 h.p. is delivered to 10 mining companies in the Kolar fields, the revenues from which are sufficient to recoup the Mysore Government for the whole of its capital outlay in six years.

It is difficult to realise what electricity has done for the mining industry. I am not thinking of its use for power distribution in and about coal mines, though on the Continent this has now attained gigantic proportions, but of the reduction in operating cost effected by the utilisation of distant water power through the medium of electricity. Mines which under the old regime could not have been made to pay have been opened up, whilst those that previously had just been clearing expenses have been enabled to pay dividends. It is estimated that the Sheba mine saved £10,000 per annum by introducing electric transmission, owing to the ore being then crushed in the mine instead of transported by aerial ropeway to a mill on the bank of a river 2¾ miles away. At the Burma ruby mines, before the installation of the electrical transmission plant the cost of fuel for power and lighting was £500 per month. The hydro-electric plant saved all this—£6,000 per annum—and enabled the company to begin paying dividends. By the installation of their three-phase plant, the first in the Rocky Mountain regions, the Silver Lake group of mines looked to save £7,200 per annum. These are a few instances out of many. The same tale is told in all cases.

The carrying out of power schemes in this country does not demand a fraction of the resource and originality demanded of engineers carrying out power schemes in some of the American States. Here a trench is made in the ground, an insulated cable is put in with or without bitumen around it, and so the transmission line is laid. Nothing could be simpler, but it is a very different matter carrying a pole line over the mountains in Colorado. There the engineer meets Nature in her most aggressive mood. Wind, snow, sleet, and lightning storms have to be faced, and through all the line must stand intact. Crossing canyons with spans of over 1,000ft.; climbing divides at an altitude of 13,000ft., in winter inaccessible and swept by frequent snow slides; carrying a pipe line to work under a head of 1,400ft. almost perpendicularly down the face of a bluff; making a 6ft. wooden pipe to stand a head of 450ft.—these are a few of the many problems which have to be solved by power engineers abroad. The construction of the pole line often presents much difficulty though many points of interest. Until recently wooden poles only had been used, but it is evident that iron and steel, being many times stronger than wood, and capable of economical disposition with regard to the strains, properly designed structures of this material would enable spans to be greatly increased. Such structures have been used in special cases and where long spans are necessary for crossing rivers or spanning ravines, but there is a growing tendency to employ for high pressures a steel pole construction with the spans made intentionally long so as to reduce the number of points of support. The number of insulators is, of course, reduced to correspond with the increased spans, and it is argued that a construction of this kind, by diminishing these weak points, gives a line less liable to interruption than one in which wood poles are used. Steel poles certainly give a construction more in accordance with engineering ideas, and though the bulk of the work may be still carried out in wood, it is probable that for main lines, whenever the magnitude of the enterprise will justify the larger investment, the more solid and permanent construction will be employed. With proper care steel piles should last at least four times as long as wooden ones, so that the sum to be set aside for renewal is much reduced, while the maintenance is also less. But against this there may, in many cases, have to be set the cost of freight and haulage to an almost inaccessible region where timber may be obtained for the cost of felling. In this instance the difference in capital outlay would be considerable, while in an iron-working district, on the other hand, it might be negligible. We shall very likely use steel poles for our power lines in this country because we produce, not wood, but steel, and have a preference for things solid and lasting. But we have easy country to negotiate compared with some of the country over which power lines run abroad—a factor which is of considerable importance.

A good example of steel construction is presented by the line of the Guanajuato Power and Electric Company in Mexico. There steel towers about 12 to the mile are used instead of wood poles, which are generally spaced 40 to the mile. In Italy iron pole work has been developed to a considerable extent. After Paderno, which was the first line to adopt an all-iron construction, the Cenischia line was erected with a similar design of pole and with spans up to 260ft. Then came the Brembo line with specially constructed spans up to 920ft. to transmit the power over the mountains. Mr. Semenza, who has done a large amount of important work in connection with this subject, informs me that amongst others at present under construction are two new lines with spans of 360ft., one of them to carry six wires, the other to carry 12. The first iron poles were unnecessarily heavy and had equal stiffness across the line and parallel to the line. Mr. Semenza has quite rightly contended that as in a straight line with equal spans the only strain to be borne by the line is exerted by the wind, it is unnecessary to employ poles of equal resistance in all directions, and he has accordingly designed a pole which presents great resistance in the direction of the wind, but low resistance in the direction of the line. This pole is elastic and can deflect over 16in. without exceeding the limit of elasticity, the consequence being that if one or two of the wires break the two nearest poles will bend, which will relieve the strain on the spans following, so that as a whole the line will stand, and no damage be done to the supports. The two new lines mentioned above as under construction have poles of this kind, as well as the Brembo line.

Several important undertakings depend only on one transmission circuit, amongst which may be mentioned the Electra-San Francisco transmission, 154 miles long; the Shawinigan Falls-Montreal transmission, 85 miles long; and the Welland Canal-Hamilton transmission, 30 miles long. There is considerable economy in having only one set of conductors, and whether the risk of breakdown on a line constructed in the manner just described is, by using two circuits, reduced to such an extent as will justify the extra cost, must always be a matter for the engineer, guided by local circumstances, to decide. When two circuits are employed the individual conductors are smaller, so that there is not necessarily a greater total weight of copper, but for high pressures a pole line for each circuit is advisable, and this with its complement of cross-arms and insulators considerably increases the outlay. Only

Digitized by Google

when the pressure does not exceed 25,000 volts, and where in consequence the risk of shut down is immeasurably less than when pressures of 40,000 to 60,000 volts are used, is it wise to adopt a construction whereby two circuits are carried on one set of poles.

Needless to say, turbine construction has been influenced to a very large extent by electric power development. Apart from the enormous amount of hydraulic engineering work represented by the utilisation of something between one and a half and two million horse-power, the improvement in the efficiency of the turbine from the date of the Francis wheel must be credited directly to the great stimulus electric power work gave to turbine manufacture While in 1870 the average power of each wheel made by one of the leading turbine firms was 70 h.p., in 1903 it was over 700 h p, and the annual output in horse-power had increased from 10,000 to 130,000. Twenty-five years ago the construction of a turbine giving 500 h p. was something of an achievement, to-day turbines are at work of 10,000 h.p. In all modern installations the electric generators are coupled direct to the turbine shafts. When it is possible, a horizontal shaft arrangement is chosen, though it is noteworthy that up to the present, owing to the special conditions to be met, the largest turbines have had vertical shafts. Generally the full-load turbine efficiency is about 80 per cent., though higher figures have been obtained, but the power of the wheel, the speed, and the fall all influence the useful return. The design of turbines has not received much study in this country, possibly because here the sphere of their usefulness is comparatively narrow. On the other hand, the subject has been studied exhaustively on the Continent, and it is to books written in another language that we must go for our information.

But if we are backward with respect to water-turbines, we make up for this as regards the steam-turbine, for if Britain is not exactly the birthplace of the latter it is the country which has seen its greatest development. The Parsons turbine was first designed in conjunction with a dynamo to form a complete generating unit, and, born in 1884, in the present year the turbo-generator attains its majority. At the time of its advent but little attention was paid to it, and it was regarded mostly as an interesting scientific toy. To-day there are 600,000 h.p. of turbines of the Parsons type at work, and in 21 years the machine has grown from a 10-h.p. infant to a 10,000-h.p. giant. The turbine is gradually being recognised as the simplest and best form of steam-engine for alternator driving, and to be preferred to reciprocating engines in every case when the generator output is over 1,000 kw., and there is available plenty of condensing water. Surely this is a wonderful example of the influence of electricity on power engineering, and when it is remembered that the great success of the turbine has been due to the ability, energy, and enthusiasm of one man, it is felt that he deserves the greatest and the best rewards that engineering has to offer.

The influence of electricity on the design of steam-engines other than the turbine is undoubted. When the dynamo first made its appearance there was no high-speed engine in the market, and it was the persistent call of electrical engineers for an engine to which their machines could be coupled direct, thus dispensing with belts or ropes and the loss of power inseparable from them, that led the late Mr. Willans to persevere and achieve such remarkable results. The dynamo gave the engineer an appliance which enabled him to ascertain to a nicety the efficiency of his engine. With carefully calibrated instruments it was extremely easy to locate and measure the losses at different loads and under various conditions, and the researches in this direction described in the classical papers of Willans are a standing tribute to his ability as an engineer and his patience as an investigator. Many have followed in Willans's footsteps, with the result that high-speed engine design has about reached its highest level. With high efficiency there has ever gone a cry for efficiencies still higher, and electricity as demanding engines of the high-speed class and providing an easy method of testing their performance has been the main factor to which the progress has been due.

I have dealt in this address at some length with the great water-power utilisations—a branch of power engineering which owes its very existence to the agency of electricity. But the influence of electricity has been apparent not only in giving birth to these undertakings, but in modifying the manner and method of power engineering in every direction. The way in which this influence has been exerted in the case of the steam-engine has been referred to, and its effect on the design of gas-engines has also been marked. Dowson, by his introduction of a heat gas, did much in the early eighties to encourage the use of gas-engines, and considerable progress resulted from his work. On account of the demand for engines to drive dynamos a large number of competitive designs came into the market, and improvement was greatly stimulated thereby. But it was not till 1896 that blast-furnace gas was used in a gas-engine, an experiment being made in that year on a very small scale at the Wishaw works of the Glasgow Iron and Steel Company. When the possibility of burning blast-furnace gas direct in the cylinder of an engine and the economy resulting therefrom were realised, a great impetus was given to gas-engine construction. But, alas, from this date the sphere of the greatest activity was shifted to the Continent, and it is there that the great business in large gas-engines has been done. It was left for the newer iron and steel works on the Continent to take advantage of the opportunities which the working with blast-furnace gas afforded. In such works the blowing, of course, comes first, and engines of 1,200 h.p. have been constructed for this. Nevertheless, a large number of engines are coupled direct to electric generators which serve to operate motors for cranes, rail straighteners, shears, pumps, and all the auxiliary machinery to be found in an iron and steel works. At the present time there are probably not less than 100 engines of over 500 h.p. working with cheap power gas to drive electric generators, and more large engines are made for this purpose than for any other. Already engines of 2,500 h.p. have been constructed for electrical work, and I understand that the designs are completed for the 5,000-h.p. size. Undoubtedly engines using gas produced from cheap bituminous coal will figure largely in the electric power stations of the future.

On the Continent a number of installations have been erected in which the by-product gas from coke ovens is utilised to drive gas-engines. In the Ruhr coke-making district in Germany there is an aggregate of no less than 6,000 h p. produced by the utilisation of waste gases from the ovens. There are coked in this country annually about 50,000,000 tons of coal, and the gas from the coke ovens is capable of yielding in gas-engines 1,000,000 h.p. continuously. In Germany and Sweden there are several works in operation producing power gas from peat. For the production of this gas the peat can contain as much as 45 to 50 per cent. of water, and it is not unlikely that there may be an opening here for the establishment of power stations near peat moors remote from coalfields. I have heard of a peat moor about 1¾ miles square capable of supplying enough gas to generate 10,000 h.p. for 60 years. This may or may not be an exaggeration, but it is certain that there is enormous industrial waste in this country, and that true co-operation in the widest sense of the term between different industries would result in large savings.

I have not touched upon that department of power engineering which concerns itself with railways. The influence of electricity has wrought revolutionary changes here, but I have already occupied your attention too long, and in dealing with a subject so vast something has to go. It is only 24 years since the first commercial electric rail way was laid down, and to-day the capital invested in street railway undertakings is something in the vicinity of 200 million sterling. In this country there are about 1,800 miles of electric tramways and about 280 miles of electric railways, of which in London alone 150 miles are opened or under construction. These figures indicate great progress, but there are many fields of enterprise as yet untilled, and in closing I feel that I have but touched the fringe of a great subject. In the application of electricity to power work, engineering finds its mission of civilisation as well as its greatest triumph, and the power lines disappearing in the jungle, climbing to the mountain tops, spanning the torrent, and descending to the fertile valleys,

Digitized by Google

bear to distant points, no less than telegraph and telephone, a message of peace and progress.

THE LIVERPOOL-SOUTHPORT ACCIDENT.

Board of Trade Report.

The Board of Trade have now issued the report of Lieut.-Colonel E. Druitt, R.E., upon the fatal collision which occurred on July 27 on the Liverpool-to-Southport line. It will be remembered that an express passenger train to Southport ran into an empty train standing on the middle line at the Hall-road Station. We reported the accident at the time, and it will be remembered that 20 passengers in the leading car were killed. Colonel Druitt reports that the collision was solely due to inadvertence in leaving the siding points in the wrong position, and then to disregard of rules on the part of Boote, the signalman at Hall-road Station box, and to disregard of rules and reckless driving on the part of Rimner, motorman of the express. The only lesson to be learnt from this calamity is the very old one—namely, of the necessity at all times of complying exactly with all rules and regulations, and that punctuality and fast running must always give way to safety. In the report Colonel Druitt also deals with the many points raised in the Press and elsewhere as to the collision in question. This part of his report reads as follows:

1. The alleged greater danger of facing points as compared with trailing points on a line on which express trains run. This danger does not exist with the safeguards especially introduced, which have been described above, to prevent a signal being lowered to the safety position unless the points are first accurately in position for the line to which the signal refers. In this case both the signalman and the driver broke important rules regarding the manner in which trains are to pass signals which are defective or out of order, and in consequence a collision occurred; but a worse collision can be brought about at trailing points on the supposition that signalmen and drivers may break rules, as then two trains running at speed could be brought into collision when converging on to a single line. Facing points are being brought more and more into use for leading on to loop lines, and for platform lines at stations while the lines for express trains run between the loop or platform lines. Their great advantage is that slow trains preceding an express can be quickly run off the fast line on to the slow or loop line or into a siding, without first running forward the whole length of the train, stopping, and then backing slowly in through trailing points, a lengthy operation, and one which keeps the fast line occupied much longer than necessary. Given the conditions of traffic at Hall-road Station, the facing connections are in my opinion the simplest and quickest way of getting the turnback trains off the down road clear of following trains, and, therefore, the safest. No doubt an ideal system would be to have separate pairs of lines for fast and slow traffic, and when the traffic warrants such a doubling no doubt it will be made, but at present the existing arrangements need only be considered.

2. Whether the open corridor type of car used on this railway fitted for electric traction is more liable to be telescoped, should a collision occur, than the ordinary pattern with separate compartments? These open cars have very strong and heavy underframes, and the tops are light and independent of the frame, being secured to it by a few bolts. It may be pointed out that the open corridor carriage is coming into use on many railways where steam locomotives are used, and, judging by the damage to the cars forming the express train behind the first motorcar, which was very slight indeed, there would appear to be no extra danger with this type of car. It must be remembered that this collision was a very violent one, the express running at a high speed into a train weighing 170 tons standing with the brakes hard on. The rear end of the first car of the standing train jumped up, and so the heavy underframe of the leading car of the express slid along under that of the first car of the standing train, and the top woodwork was all torn away, and the two cars completely telescoped one inside the other. The standing train was driven back a distance of 50 yards with the wheels not revolving, but skidding, so that some telescoping was certain to occur whatever type of vehicle was in use. Two years ago a passenger train of ordinary coaches ran into the buffer stops at a terminal station at a speed of about 12 miles an hour. The locomotive was hardly damaged, but the rear ends of the carriages next the engine were thrown upwards, and the underframe of the second carriage from the engine was thrust under that of the first carriage and was completely telescoped, and 16 of the passengers in it were killed. This collision also raises the old question of always having an empty carriage next the engine where no luggage compartment is so placed, especially as there is no locomotive on these trains to act as a buffer. The motorcars at each end of these trains have, first, a motorman's compartment, then a luggage compartment, and then a vestibule with the entrance and exit doors at the sides, amounting in all to a space of 14ft. between the front and the first portion of the car used for passenger accommodation. I do not consider it practicable to require the motorcars at each end of the train to be run empty. End-on collisions are as likely to occur as head-on collisions, so the same precaution would be necessary at the tail as at the head of the train. Much greater security can be obtained by strict observance of rules, and the fact that one driver has recklessly run past a stop signal in the danger position at a very high speed cannot be regarded as one requiring the very onerous conditions to be imposed which would result if no passengers were allowed in the motorcars. Such conditions would quite prevent the use of single steam motorcars, which are now being used in great numbers by several railway companies.

3. With regard to the danger from fire, it may be pointed out that on this occasion as soon as the collision occurred a short-circuit was set up between the live rail and running rail, probably through a bar falling across them, and so a very large arc was formed at once, and this blew the section circuit breakers at the Formby sub-station, but not those at the Seaforth sub-station, which were much further away from Hall-road, but the sub-station attendant at Seaforth records a heavy overload at the moment of the collision. This arcing caused by the short-circuit soon ceased, either from the bar being fused through or something being moved, and then the current fed to the third rail from Seaforth was normal, showing that no short-circuit existed. When the circuit breakers at Formby sub-station blew, the switchman on duty there telephoned to Seaforth sub-station and also to Formby signal box to know if anything was wrong, and being informed all was well there, he, thinking the circuit breakers had blown through overload, restored them and found there was a load of 600 amperes (less than the normal load), and this shows that there was no longer a short-circuit, and, therefore, no arcing taking place. As soon as he had restored the circuit breakers the Hall-road stationmaster rang him up to cut off the current, which was done at once both at Formby and Seaforth sub-stations, and the third rail rendered dead for that section of the line. About four minutes had then elapsed since the collision had occurred. On subsequent examination it was found that there were no signs of fire on any of the cars, except a slight charring of the woodwork underneath the first car of the standing train, and signs of short-circuiting between the broken conductors and the ironwork under the car, which caused a certain amount of smoke, but there was no actual fire in any of the carriages, and no one in them could have received any electric shock. It may be mentioned that iron bars are supplied to stationmasters, and are also carried on the trains, for setting up a short circuit and thereby blowing out the circuit breakers at the sub-stations in case of emergency. On the occasion in question the stationmaster should have telephoned at once to have the current cut off, as he saw the large flame of the arc, instead of first going to the scene of the collision. It may be remembered that in a bad end-on collision last winter the derailed coaches of an express train, driven by steam, caught fire and several were totally destroyed. So far as can be gathered from the results of the first bad collision on a railway worked by electric traction in this country, there would appear to be no extra danger of fire occurring among derailed coaches than on a railway worked by steam.

4. It may also be mentioned that, though there is only one motorman on each electric train, the guards are instructed as to how to stop a train in case of emergency should the motorman be suddenly incapacitated. On electric express trains there is one guard, with instructions, as soon as the train starts, to walk through the train from end to end, count the passengers, and then stand behind the motorman for the remainder of the journey. On electric stopping trains there are two guards, one of whom is always standing behind the motorman when the train is running. Looking at the facts connected with the collision, the two most striking results are, first, the absence of any fire among the derailed coaches, the danger from fire being one regarded as especially liable to occur on railways using electric traction; and, secondly, the very small amount of damage done to the cars, with the exception of the leading one of each train, due, no doubt, to the very heavy and stiff underframes. Probably the collision would not have been so severe if steam locomotives had been in use, as under the same conditions the acceleration of the express would not have been so rapid; that on the electric trains is stated to be such that a speed of 30 miles an hour can be obtained from rest in a period of 30 seconds, but this and the quick stopping due to the very powerful brakes in use form the great advantages of electric traction for a fast and frequent passenger service of trains, and no danger need result therefrom if the ordinary rules for working trains are adhered to.

LEGAL INTELLIGENCE.

TRAMWAY ACCIDENT.

An action was heard by Judge Mansel Jones at the Sheffield County Court on Wednesday, when Mrs. Elizabeth Prior sued the Sheffield Corporation for £25 damages for personal injuries.

Plaintiff's case was that she was crossing the road, when a number of people—who were being refused admission to a tramcar which had not reached a stopping-place—were flung back, and some of them falling against the plaintiff, she fell to the ground. The Corporation repudiating liability for an accident which they contended was caused by the improper attempt of passengers to board it before it reached its proper stopping-place.

His Honour said the witnesses for the defence had contradicted themselves, and held that plaintiff had made out a good claim, and gave judgment in her favour for the amount claimed.

TRAMWAY CLEANER'S INJURY.

At Cardiff County Court last week, John Lethbridge, a car cleaner in the employ of the Corporation, sued the latter for damages for injuries under the Workmen's Compensation Act.

The case for the plaintiff was that whilst engaged on repairing cars in the car-shed he went to grind a tiebar at the emery wheel, when his hand was caught by the wheel and the top of one of his fingers was torn off, and his left hand otherwise injured. He had not worked for 18 weeks as a consequence, and his hand was not right yet. After the accident a notice was put up forbidding the use of the wheel.

For the Corporation it was contended that no one but a machinist had a right to use the emery wheel in the way plaintiff had used it. It was his duty to take the tiebar to the foreman, and the accident was due to the fact that, as an unskilled man, he was trying to do something that only a skilled mechanic ought to do.

His Honour believed that the accident was due to a defect in the wheel, and gave judgment for plaintiff for £60, with costs.

COMPANIES' MEETINGS AND REPORTS

CUBA SUBMARINE TELEGRAPH COMPANY.

The ordinary general meeting of this Company was held on Wednesday under the chairmanship of Mr. C. W. Parish.

The CHAIRMAN stated that the traffic receipts for the last six months had amounted to £14,811, as against £16,526 for the corresponding period last year. This difference was due to the fact that last year the French cable had not been down part of the time, and this was the means of bringing extra traffic which usually did not come to them. To their traffic receipts had to be added an amount of £1,450, being interest on investments, making, with transfer fees, a total of £16,272. Their expenses were £6,334, and the preference dividend for the half-year amounted to £3,000, making altogether £9,334, which enabled them to declare a dividend on the ordinary shares at the rate of 5 per cent., leaving £2,938 to be carried forward. The reserve fund now stood at £85,181. It was a matter of great satisfaction to them to know that they were able to meet all demands for fresh cables and repairs and still have a satisfactory reserve. Their appeal to the law courts of Cuba for the subsidy due to them for cost of cables had not yet come up for judgment.

The report was adopted without discussion.

BRITISH COLUMBIA ELECTRIC RAILWAY.

The ninth ordinary general meeting of this Company was held under the chairmanship of Mr. R. M. Horne-Payne. Full particulars of the report appeared in our last week's issue.

The Chairman reviewed the position generally, after which the report and accounts were unanimously adopted, as also was the following resolution: "That the payment of the dividend on the cumulative perpetual preference stock and preferred ordinary stock and the payment of the interim dividend at the rate of £3 per cent. on the deferred ordinary stock, paid in April, 1905, be approved, and that a balance dividend on the deferred ordinary stock at the rate of £3 per cent., making a total dividend of £6 per cent. (free of income tax) for the year ending June 30, 1905, be declared."

NORWICH ELECTRIC TRAMWAYS.

The ordinary general meeting of this Company was held last week, Baron E. B. d'Erlanger presiding.

The directors' report stated that there was a gross profit for the year of £10,838. 6s. 9d. Out of this amount the 4 per cent. interest on the Company's mortgage bonds for the year—viz., £2,640—has been paid, and £1,000 placed to reserve fund account (which now stands at £4,196. 17s. 1d.), leaving £7,198. 6s. 9d. to be dealt with. The directors recommended that a dividend of 2½ per cent. be paid on the shares of the Company for the year ended June 30, 1905, absorbing £6,600, and that the balance of £598. 6s. 9d. be carried forward. The revenue shows a decrease of £81. 6s. 7d., and the expenses an increase of £680. 13s. 11d., consequently there is a decrease in the profits of £762. 0s. 6d. The directors would, however, point out that exceptional outlay has been made on maintenance and repairs, including the renewal of several important junctions and a number of crossings, etc., these several items aggregating an amount of about £1,300. If the exceptional expenditure referred to above is deducted from the total expenses for the year, a decrease of some £620 would be shown in the ordinary operating and maintenance expenses. The average working cost per car mile was 5·30d., as against 5·24d. in 1904. The average receipts per car mile were 7·76d., against 7·74d. the previous year. The number of passengers carried was 7,409,126, and the number of car miles run was 1,083,055.

The report was adopted.

INDIAN ELECTRIC SUPPLY AND TRACTION.

The first ordinary general meeting of this Company was held last week, Sir W. D. Lawrence presiding.

The CHAIRMAN stated that the first shipment of cables had been made, and the contractors were of opinion that they would be able to supply current in March next for lighting and fan purposes. In Cawnpore the canvassing indicated that their customers would be exceedingly numerous. Every help was being received from the authorities. In addition to Cawnpore, the directors contemplated developing electric traction in other large towns in India, though they would not extend their operations until the success of their initial experiment was fully assured. At the present moment, of £125,000 stock, £100,040 had been paid up, and the remainder would fall due in September next. The report was adopted.

SWANSEA IMPROVEMENTS AND TRAMWAYS.

The half-yearly report of this Company shows that the gross receipts amount to £16,751. 9s. 11d., being an increase of £2,920. 11s. 9d. upon the corresponding period of last year, and the expenses (including debenture and other interest, and provision for amount payable to the Swansea Corporation in respect of lines to be leased) to £12,542. 19s. 4d., an increase of £2,557. 13s. 2d. The profit on the half-year's working is £4,298. 10s. 7d., which, added to the balance of £1,987. 10s. 4d. brought forward, makes a total of £6,286. 0s. 11d. at the credit of profit and loss account. Of this sum it is proposed to place £1,000 to the reserve account, £1,299 will absorb the dividends on the preference shares, and £3,935. 6s. 11d. is to be carried forward. Referring to the new tramway extensions, the directors say the yearly amount payable to the Corporation in respect of the lines, which is to be based upon the capital properly expended by the Corporation in their construction, has not yet been determined, and the amount set aside in the profit and loss account as payable up to June 30 is calculated upon an estimate furnished by the Corporation. The working of the Mumbles section, as usual in the first half of the year, shows a deficiency of £3,052. 8s. 4d., and the net loss on the improvements undertaking for the half-year amounts to £352. 9s. 11d., of which £309. 5s. 5d. is represented by accrued interest on mortgages. The detailed accounts show in regard to the tramways undertaking that the capital issued amounts to £206,250, and that the amount received for sale to the Swansea Corporation of the electrical equipment of the Morriston section of the Company's lines £6,640, and that £392 were the expenses of opposing the Corporation Bill of 1905. The traffic receipts for the half-year amounted to £16,333. 18s. 4d. The route miles now opened for traffic are 11·40, and the number of passengers carried was 3,018,701, as compared with 2,555,287 for the corresponding half-year of 1904, whilst the average receipts per passenger had gone up ·3d., and the expenditure decreased by ·1d. The total sum provided to date by the British Electric Traction Co. for capital expenditure, working deficiencies, and for first quarter's rent of lines amounts to £43,014. 2s. 9d.

NEW COMPANIES REGISTERED.

Consolidated Supply Co., Limited.—Capital, £50,000. Object: to acquire and extend the works and business of the Consolidated Electrical Co. The price to be paid by the Supply Company for such premises and business has been agreed at the amount representing the same in the last balance-sheet, and is to be paid and satisfied partly in cash and partly by the allotment to the old company of 15,000 of the preference shares of the new company, credited as fully paid, and in addition thereto a further sum in cash which will be more than sufficient to defray the administration expenses incurred since March 31. The directors have, under the terms of the agreement, secured to the shareholders the right to subscribe for 6 per cent. preference shares in the Supply Company, to a total amount of not exceeding £5,000. Registered address: Broad-street House, E.C.

Radia Motor Co., Limited.—Capital, £75,000. Object: to adopt an agreement with Jules Roth, of 36, Rue Taitbout, Paris, to establish in England, France, or elsewhere factories and workshops for the construction of motors and motor machinery driven by electricity or other agency. Registered office: 1, Broad-street-place, E.C.

Liens Registered.

Electromobile Company, Limited, Lambeth, S.E.—Mortgage dated Aug. 10, 1904, stamped to cover £10,000, was on Oct. 5, 1905, stamped to cover a further £10,000. Mortgagees: North of England Trustee, Debenture, and Assets Corporation, Limited, of Manchester, charged on a certain percentage of all moneys payable under contracts for sale, garage, or supply of electricity.

South Metropolitan Electric Light and Power Co., Limited.—Issue on Sept. 29 of a debenture for £10,000, part of a series created

Digitized by Google

by resolutions of July 3, 1900, and May 6, 1904, to secure a sum not exceeding the amount of the share capital issued and paid up for the time being charged on the company's undertaking and property, present and future, including uncalled capital. The debentures are issued to the trustees for further securing debenture stock, created by trust deed of Aug. 3, 1900, supplemented by trust deed of June 3, 1904. Trustees: Mr. H. R. Beeton, 18, Austinfriars, E.C.; and Mr. W. R. Davies, 10, Moorgate-street, E.C. Total amount previously issued of same series, £200,000.

APPOINTMENTS VACANT.

Premium Pupil, Electricity Works, Canterbury. See advertisement.

Tramway Constructional Engineer for the Far East. Apply Box R 7, *Electrical Engineer* Office. See advertisement.

Electrician, Poplar and Stepney Sick Asylum, Devon's-road, Bromley-by-Bow, E. Applications to the Clerk by Oct. 21.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sells Advertising Offices, London, E.C.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office. See advertisement.

Resident Engineer, commencing salary £300, rising to £400 per annum; Sub-station Superintendent, salary to commence at £250, rising to £350 per annum; and Shift Engineer, salary to commence at £150, rising to £250 per annum; Birmingham Corporation. Applications by Oct. 30. Full particulars in advertisement columns.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Bermondsey.—Tenders for new plant will shortly be advertised for.

Wimbledon.—We understand that tenders will be called shortly for electric pumps for the sewage works.

Edinburgh.—The Corporation require tenders for arc lamps and arc lamp-posts. Tenders by Oct. 23. See advertisement.

Stoke-upon-Trent.—The Guardians invite tenders for (1) rewiring a portion of the workhouse and cottage homes, and (2) replating the battery. Tenders by 9 a.m. on Nov. 1.

Madrid.—The Public Works Department require designs for a scheme of electric tramways in the town. Particulars from Direccion General de Obras Publicas, Madrid. Tenders by Nov. 27.

Edinburgh.—The Parish Council invite tenders for an installation of intercommunication telephone system throughout the offices, Castle-terrace, Edinburgh. Tenders to the Clerk by 10 a.m. on Nov. 7.

Utrecht.—The Government Railways require tenders for Contracts 215-219—for steel plates, tirefonds, bolts, etc. Specification (1s.) from the Chief of Works and Stores, Morcelse Park, Utrecht. Tenders by Oct. 24.

Brisbane.—The Postmaster-General invites tenders for 150 branching system table telephones. Tenders by Dec. 1. Particulars may be obtained from the Postmasters-General at Sydney, Melbourne, Brisbane, and Adelaide.

London, S.W.—The London County Council invite tenders for wiring and fittings for the electric lighting of the bandstand in the Villiers-street section of the Victoria-embankment Gardens. Tenders by 10 a.m. on Oct. 25.

Greenwich.—The Guardians invite tenders for repairs to the batteries at their installation at Grove Park Workhouse, Lee, S.E., and also for maintenance of same. Full particulars can be obtained and the installation inspected on application to the Master. Replies before Oct. 24.

Dundee.—The Dundee Harbour Trustees invite tenders for the supply and erection at the Craig Pier of three electric arc lamps and three electric incandescent cluster lights, with the necessary wiring, switches, etc. Tenders to Mr. J. Thompson, harbour engineer, Dundee, by 10 a.m. on Oct. 25.

Barrow-in-Furness.—The Corporation invites tenders for the supply and erection of a 500-kw. combined steam-engine and generator, balancer booster, switchboard, water-tube boiler, mechanical stoker, economiser, travelling crane, cooling tower, pipes, etc. Tenders by 12 noon on Nov. 13. See advertisement.

Netherlands.—The Board of Trade have been notified by the acting British consul at Amsterdam (Mr. F. A. Chambers) that the Zuid-Hollandsche Electrische Spoorweg-Maatschappij (South Holland Electric Railway Co.) will be prepared to receive tenders for the making of ground works, engineering, and additional works between the Ceintuurbaan and "piket 120 by 70" (in connection with the works of Contract No. 14), the laying of rails and switches, and the supply and use of gravel ballast, as well as some works in connection with the railway, in accordance with Contract No. 17. The estimated cost of the work is 936,000fl. (£78,000). On Oct. 25, at 10.30 a.m., an explanation will be given, meeting place Café, "Plaats Lommerrijk," on the Bergweg, near Hillegersberg. Copies of the contract, with drawings, may be obtained from Messrs. Beversen and Van Hoorn Heerengracht, 38, The Hague, at a cost of 12·20fl. (£1. 0s. 4d.). Tenders should be written on stamped paper, and received before 1 15 p.m. on Nov. 2.

RESULTS OF TENDERS.

Bombay.—The Brush Electrical Engineering Co. have obtained the contract for an 80-kw. dynamo for the Jubilee Technical Institute.

Hammersmith.—The Council have accepted the tender of J. and A. Law, of Glasgow, at £57. 10s., for extension of the handrail around the main switchboard.

Birmingham.—The Corporation have accepted the tender of T. Lowe and Sons, Burton-on-Trent, at £22,220, for erection of a tramway depot in Moseley-road.

Hampstead.—The Lighting Committee of the Borough Council have accepted the tender of Rickett, Cockerell, and Co. for the supply of steam coal to the electric lighting station for 12 months.

Mansfield.—The Brush Electrical Engineering Co. have obtained the contract for the Mansfield Light Railways Co. (through J. G. White and Co.) for a car to be used for watering and cleaning the track.

Private Plant.—Messrs. Dougill's Engineering Co., Leeds, report an order from the Masborough Co-operative Society for the supplying and erecting of a four-cylinder vertical gas-engine of 140 b.h.p. coupled direct to a 67-kw. generator, the plant running at 250 r.p.m.

Stoke Newington.—The Borough Council have awarded the contracts for sub-station plant as follows: Electrical Power Storage Co., at £998. 10s., for 244 P 11 cells; Ferranti Limited, for switchgear. The rest of the contract has been placed with Bruce Peebles and Co., Edinburgh.

Shanghai.—Messrs. Bruce Peebles and Co., Edinburgh, have received the complete contract for the construction of electric tramways, including 30 miles of track, overhead work and cables, power station plant, and 100 cars and equipments, the total value of the contract being £377,000.

Watford.—The Urban District Council have received the following tenders for supply and erection of a steel chimney at their electric lighting works:

J. Fraser and Son, Millwall, E. (accepted)	£131	0	0
Ashmore, Benson, Pease, and Co., 47, Victoria-street	132	10	0
Norton Hardy Engineering Co., Great Bridge, Tipton	138	0	0
T. Pigott and Co., Spring-hill, Birmingham	143	10	0
J. Thompson, 49, Queen Victoria-street	205	15	0
Teeside and Bridge Engineering Co., 39, Lime-street, E.C.	182	10	0
Heenan and Froude, Newton Heath, Manchester	192	10	0
Willans and Robinson, Ferry Works, Queen's Ferry	189	0	0

London, S.E.—The Metropolitan Asylums Board have received the following tenders for electric lighting, power distribution, fire-alarms, and telephone installation, etc., at the South-Eastern Hospital and Ambulance Station:

Bromley and Batstone, 24-26, Holborn, E.C.*	£4,894	0	0
Buchanan and Curwen, 64, Victoria-street, S.W.	5,495	0	0
Foote and Milne, 66, Victoria-street, S.W.	5,535	0	0
Wenham and Waters, Croydon	5 974	0	0
Alliance Electrical Co., 23, Grafton-street, W.	6,026	12	0
F. A. Glover and Co., Vine-street, Clerkenwell, E.C.	6,500	0	0
Drake and Gorham, 66, Victoria-street, S.W.	6,590	0	0
Belshaw and Co., 53, Victoria-street, S.W.	6,894	0	0

* Recommended for acceptance.

BUSINESS NOTES.

TRACTION.

Geneva Tramways Co.—The receipts for September were £9,265, being an increase over the corresponding period of last year of £605.

Heywood.—The running of the steam tramcars has ceased in consequence of the reconstruction necessitated by the adoption of the electric system.

Batley.—The work of electrifying the Bradford-road tramway system is nearing completion, and it is believed that trams will be running next month.

Manchester.—The Tramways Committee have promised to consider the application of the ratepayers of Chorlton-cum-Hardy for an improved omnibus service.

Hastings.—An extensive correspondence is proceeding in the local Press as to whether there shall be a Sunday service, opinions being apparently divided on the point.

Bombay.—In reference to our previous note on this matter, it is stated that the action of Mr. Bingham against the Corporation has been dismissed in the Indian courts.

Paddington.—A correspondent writes in the local journal advocating the adoption of the electric tram system in Edgware-road, and produces ample evidence in support of his view.

Bournemouth.—Public meetings are being held in the Branksome ward both in favour of and against Sunday trams, the general consensus of opinion being apparently against them.

Perth.—An animated discussion occurred at a special meeting of the County Council on Monday on the question of Sunday running. Eventually a resolution was carried against a Sunday service.

Brighton.—In view of the reduced number of passengers travelling on the trams during the winter months, the Corporation have decided to somewhat reduce the service, so as to secure economical working.

Paisley.—Speaking at a meeting of the Town Council, Provost R. K. Bell remarked that the advent of electric tramways was one of the most important events which had taken place since his connection with the Council.

Digitized by Google

Cardiff.—The Tramways Committee have agreed to accept contractor's reduced tender for the supply of tickets, the price being 15s. per bunch instead of 18s., which is expected to result in an economy of £60 per annum.

Charing Cross, etc., Railway.—The London County Council have disapproved the plans submitted by the company for the Oxford-street station, on the ground that staircase exits leading from public footways are a source of danger to pedestrians.

Maidstone.—It is reported that the Board of Trade has informed the Urban District Council that Upper Stone-street is not included in the recent order for extensions. The Board declines to give any reason, and the matter is expected to be reconsidered by the Council at an early date.

Belfast.—The work of training the drivers and conductors in the management of the new electric cars is proceeding. The Town Council have decided to place the tramway advertising contract with Mr. Courtney on the following terms: £1,400 for the first two years and £2,500 for each of the additional five years.

Spain.—A company has been formed at Barcelona with a capital of 3,000,000 pesetas subscribed capital to construct tramways in the Baleares. Application has been made to the Public Works Department, Paris, by Don José San Roman, of Oviedo, for a concession to construct, in three sections, an electric tramway near Oviedo.

Halifax.—The Corporation have not yet obtained the necessary parliamentary powers for an extension of the tramway system to Bailiffe Bridge, and as the Board of Trade declines to grant a provisional order for an extension beyond the city boundary, the matter will remain in abeyance until the Corporation apply for another Act of Parliament.

Croydon.—The division of the ratepayers who favour the complete municipalisation of the tramways have opened a campaign with a view to securing their object. At last week's meeting of the Corporation the plans submitted by the British Electric Traction Co., showing the route along which it is proposed to lay underground cables in connection with the Mitcham-road, etc., extensions, were approved.

London United Tramways Co.—At a meeting of the Hammersmith Borough Council on Wednesday the Works Committee, having considered the borough surveyor's report, recommended that notice be served on the company requiring them to repair the wood paving along Uxbridge-road, Goldhawk-road, Glenthorne-road, Beadon-road, Studland-street, and King-street, between the Broadway and Young's-corner.

Whitworth.—At a meeting of the District Council it was reported that the Rochdale Corporation were unable to secure power to construct tramways in Whitworth under a provisional order, but that if Whitworth obtained the necessary powers, Rochdale would be prepared to work the tramways on terms to be arranged. The Council resolved to fall in with the Rochdale Corporation's offer provided that the terms mentioned were satisfactory.

Leith.—Owing to the current on the Leith Walk section running to earth, there was a delay in resuming the service. The cause of the stoppage was due to the bell connected with the circuit breaker on the car failing to ring, when the motor equipment went out of order. The defect was soon remedied. This is the first hitch since the opening of the system. It is stated that the portions of the new electric system still under construction will be opened on Friday, Nov. 3.

Bolton.—We have received a copy of the accounts presented to the Borough Council for year ended March 31, from which we see that the income totalled £95,766, being an average of 10·634d. per car mile, while the expenditure amounted to £55,202, representing an average of 6·13d. per car mile, leaving a gross surplus of £40,564. Interest and sinking fund absorb £13,014 and £12,278 respectively. After placing to the reserve the substantial sum of £11,600, the Corporation were able to assign nearly £4,000 to the relief of rates.

Dundee.—Considerable progress is being made with the construction of the tramway between Dundee and Monifieth, and it is anticipated that cars will be running before Christmas. A slight deviation has been made from the original plans at the point where the system will leave Craigie estate and enter upon property of the Earl of Home. Instead of encountering a pretty stiff gradient, arrangements have been made for the new roadway which has been made to the north of Stannergate Station, running through a corner of the Earl of Home's estate, and thereby saving the climb.

Aberdeen.—From the report of the Tramways Committee for the year ended May 31 we learn that the total income amounted to £70,430, averaging 10·46d. per car mile, and the general working expenses totalled £42,393, leaving a net balance of £28,037, out of which interest and sinking fund absorbed £10,882 and £2,858 respectively. The amount carried forward to renewal account reached £10,562, whilst £2 846 was written off for depreciation. The total length of single track is about 27½ miles, and the mileage covered during the year covered by the report reached 1,617,525, whilst the number of passengers carried amounted to 17,142,896.

Southend-Colchester Light Railway.—The light railways order, as modified and confirmed by the Board of Trade, authorising the construction of light railways from Southend to Colchester has now been published, giving exact details as to the powers granted and the reservations provided for. The proposed railways form a series of five, making a fairly direct line from Colchester to Southend with a hiatus between West Mersea and Bradwell, where the estuary of the Blackwater intervenes. The gauge is 4ft. 8½in. The length of the line is to be 9½ miles. The motive power authorised for the company includes electricity as well as steam power. The capital of the company is to be £300,000 in 30,000 shares of £10 each.

Manchester-Ashton.—Negotiations are proceeding between the Manchester and Ashton Corporations for alternate through running of the two authorities' cars. Under the agreement between the two Corporations Ashton should have commenced running cars to and from Droylsden on Sept. 30, and six new cars were obtained. Manchester did not, however, favour the break in the through journey, and a deputation from the Ashton Tramways Committee recently waited upon them, and proposed as an alternative that the Ashton cars should run through to and from Manchester, each authority to take the receipts in its own district and pay to the other the working expenses. The proposal is at present under consideration.

Lincoln.—The work of electrifying the tramways is approaching completion. The length of the track is a mile and three-quarters, the same distance as was covered by the old tramways, and the course occupies the High-street between Lincoln and Bracebridge. Penny fares are to be the rule for adults, and it is possible children will be charged half-price. As our readers will recall, the "G. B." surface-contact system is being employed. Messrs. Griffiths and Co., engineers, of London, have been entrusted with the work, the contract price being nearly £20,000. There is a clause in the agreement between the engineers and the Corporation that if the undertaking does not answer within a certain period, they will convert the tramways into an overhead trolley system free of cost.

Ramsgate.—The Board of Trade inquiry into the accident on the East Cliff on Aug. 3, when a tramcar went over the cliff and seven persons were injured, was resumed last week. The inquiry had been adjourned for the attendance of the driver, Lewin William Lloyd, who had been suffering from the effects of the accident. The driver now stated that before reaching the hill where the accident occurred he had no difficulty in controlling the car, but when he got on the hill the car skidded. He released the power brake and worked the sand pedal, but no sand came. Witness complained that the upper part of the hill was not kept well sanded by the company. He denied that he applied the brake suddenly. Before he reached the scene of the accident he found the sand pedal in good order, and could not explain why it went wrong. He knew the bunkers were full of sand when he took over the car. After further evidence the inquiry was closed.

Birmingham.—Considerable progress has been made during the past few weeks in connection with the tramway extension scheme. It is expected that one of the sections will be completed at the end of this month. Estimates are being prepared in connection with 14 miles of additional tramlines to be constructed early next year in other parts of the city. The Electric Supply Committee of the City Council propose that the charges to the Tram Committee for tramways inside the city boundary in future be for the first four million units per annum 1½d. per unit net, for the second four million units per annum 1¼d. per unit net, for any quantity taken in excess of eight million units per annum 1d. per unit net. When the tramway leases fall in next year, and when the new lines which are being constructed by the Corporation are being worked by the Tram Committee, it is estimated that the quantity of electricity required for traction purposes will exceed 8½ million units per annum, the cost of which on the scale suggested will work out at 1·34d. per unit on the average. When, however, the Bristol-road route comes under the control of the Corporation in 1911 this average will be reduced somewhat, inasmuch as the quantity of electricity required for local tram purposes per annum, it is estimated, will then be over 12 million units.

Southend.—A meeting under the auspices of the Cab Trade Association was held to protest against the proposed extensions of the trams down High-street, and it was resolved to petition the Corporation against the proposal. With reference to our notice last week, that it had been decided to extend the tramway system to Shoeburyness, detailed estimates are now set forth showing the total expenditure as being £67,250, including £24,500 for the new road and wall to Halfway House, Undercliff road, etc. From this amount was to be deducted Colonel Burges's contribution of £6,000. It is proposed to raise a loan for the purpose of public improvements along the beach of £10,000, and this amount to be deducted from the £24,000 mentioned above, leaving a net total chargeable to the light railways department of £51,250. In regard to the High-street and Marine-parade sections, the following estimates were approved: the annual expenditure was estimated at £1,989 (working expenses, 43,000 car miles at 8d. per car mile, £1,433, and loan charges, £556), and the income at £3,108 (43,000 car miles at 1s. 2d. per car mile £2,508, 2½ per cent. increase on other lines on present income £500, advertising £100). The surveyor reported engineering difficulties in connection with the latter scheme, and made certain suggestions for remedying them. It was decided to refer this matter to a committee.

Portsmouth.—An accident occurred last week, when two ladies, in the act of crossing the road, were knocked down and injured by an approaching tramcar. Fortunately the cowcatcher acted with great efficiency, and prevented more serious consequences. Supplementing the note contained in our issue of Sept. 22, the car miles covered during the year ended March 31 totalled 1,974,996, over which 19,625,329 passengers were carried, averaging 9·94 passengers per car mile. The traffic receipts during the same period amounted to £95,699, which is equivalent to an average of 11·63d. per car mile, and 1·17d. per passenger carried. The gross receipts reached £102 452, and the percentage of working expenses to total receipts averaged 43·74d. The report of the resident engineer shows that the station equipment is in a satisfactory condition, and practically the same as when first put down. The condensing plant is now too small for the requirements, and during the forthcoming year it will be necessary to instal larger plant so as to deal with the increasing load. The overhead line has been kept up-to-date, and repairs, where necessary, have been effected. The low-tension cables are in a satisfactory condition, and have given no trouble whatever. As regards permanent way, the track may be considered satisfactory, most of the points and crossings having been renewed. The cars are showing signs of wear and tear, and a further increase in the cost of their maintenance is anticipated during the coming year. The workshops are complete, and the

Digitized by Google

machinery installed has assisted considerably in the efficient maintenance of the rolling stock.

Leeds.—The revenue returns for the financial half-year from March 25 to Sept. 30 show that the gross receipts amounted to £165,226. 2s. 9d., an increase of £4,136. 16s. 11d. as compared with the gross receipts of £161,089. 5s. 10d. for the corresponding half of last year. The actual traffic receipts amounted to £163,286. 17s. 2d., as against £159 053. 2s. 5d. taken on the cars in the same months of 1904, the increase being £4,233. 14s. 9d. With improvements in the service, the car mileage is a constantly increasing quantity, and during the half-year it reached a grand total of 3,674,307 miles, as compared with 3,608,736 miles, an increase of 65,571 miles. For this increased amount of running the extra cost of working is only £593. 7s. 4d., the total working expenses being £86,154. 0s. 8d. Thus the gross profit for the half-year is £79,072. 2s. 1d., showing an increase of £3,543. 9s. 7d. over the gross profit for the corresponding half of 1904. The increase in the number of passengers carried, again comparing the same two half-years, was no less than 2,264,993, or more than five times the entire population of the city. In the previous half-year the number of passengers carried was 34,108,522, and this grew until, in the half-year just closed, the enormous total of 36,373,515, which means that the entire population of the city was carried 80 times. The 1d. passengers are in a very large majority, numbering 26,663 863, or 73·22 per cent. of the whole. Halfpenny stages come next with a total of 4,031,188, or 11·9 per cent.; and they are followed by the buyers of 2d. tickets, numbering 3,180,037, or 8·74 of the total. Three-halfpenny fares are only found on a few routes, and these total 791,803; while the 3d. tickets issued numbered 553,400. Workmen's tickets and exchange tickets issued to workmen making their return journey in the evening are pretty evenly balanced, and together reach a total of 1,183,224, or 3·25 per cent. The receipts for the half-year work out at 10·66d. per car mile run, which is a slight increase of ·08d. over the average car-mile receipts of 10·58d. last year. The average fare paid during the half year was 1·08d.

London County Council.—The extensions referred to in our issue of last week, which are estimated to involve a total expenditure of £411,460, have been approved. Street widening improvements consequent upon these schemes were also sanctioned, subject to the usual conditions of consent of the local authorities concerned, and their agreeing to contribute to the cost. In the case of the Tooting line the Improvements Committee recommended that the Wandsworth Borough Council should be asked to contribute a third of the cost, the remaining two-thirds to be charged to the account of the improvement. An amendment was carried to the effect that the point whether part of the cost should not be charged to the account of the tramway should be left for the Council's subsequent decision. It was decided that 1d. fares should be charged on the Council's northern tramways between Aldwych and Holborn Town Hall, and between Holborn Town Hall and the Angel, Islington, the fare between Aldwych and the Angel to be 1½d. At Tuesday's meeting of the Council the Highways Committee recommended that £5,300 be voted for additional high-tension feeder cables for the Elephant and Castle sub-station. They also recommend that the construction of the track work for a through route between the Strand and Islington be transferred from the Council's Works Committee to Messrs. J. Mowlem and Co., the estimated cost of the work being about £1,780. The committee also recommended that permission be accorded the Metropolitan Water Board, the Gaslight and Coke Co., and the London Hydraulic Power Co. to lay mains along the Council's subway upon the usual terms of user. The receipts for the week ending 7th inst. amounted to £14,624, against £13,048 last year, whilst for the period from April 1 to Oct. 7 the revenue totalled £412,834, against £350,602 for the corresponding period of last year. At Wednesday's meeting of the Fulham Borough Council the Law and Parliamentary Committee presented a long report containing a summary of the correspondence with the County Council relative to street improvements in connection with the projected tramway from Putney to Harlesden. The attitude of the Borough Council is indicated by the following resolution: "That the London County Council be informed that this Council regrets and deprecates the payment out of the rates of the sum of £64,000 for the acquisition of the respective interests affected by the proposed widening of High-street, in front of the King's Head public-house, and which has not resulted in the extinction of the license in respect of such premises, though land has been acquired at a cost of more than £228 per square yard, equalling the enormous rate of £1,106,285 per acre."

LIGHTING AND GENERAL.

Falmouth.—Electric light cables are now being laid in the town.

Llandilo.—The revenue of the electric lighting for the quarter was £122.

Gelligaer.—The District Council have decided to apply for an electric lighting provisional order.

Oriental Telephone and Electric Co.—The directors have declared an interim dividend of 5 per cent. on the ordinary shares.

Yarmouth.—The Guardians have decided upon the electric lighting of the new lodge entrance and the long avenue leading up to the workhouse.

Whitehaven.—It is proposed that separate committees be appointed to have charge of the water and electric lighting undertakings of the Corporation.

Oriental Telephone and Electric Co.—The directors have declared an interim dividend of 5 per cent. on the ordinary shares free of income tax.

Edinburgh.—Councillors Stevenson and Cunningham and the resident electrical engineer have been appointed to visit the Electrical Exhibition at Olympia.

Todmorden.—The new electricity works were formally opened last week.

Torquay.—An inquiry is to be held into the application of the Corporation for a loan of £9,500 for the proposed extension of the existing electricity works.

Hayward's Heath.—The Urban District Council have been approached by the promoters of a company with regard to the introduction of electric lighting.

The Ceuta Cable.—A Reuter telegram from Almeria states that the steamship "Buccaneer" has begun repairing the cable connecting Alhucemas, Melilla, and Ceuta.

Smallwood (Cheshire).—The electric light has been installed in the village, which only contains a population of 300, by Messrs. Samuel Jackson, builders and contractors.

Consolidated Electrical Co.—The directors have decided to pay off the arrears of dividends on their preference shares for the period from Nov. 30, 1903, to May 31, 1905.

Elgin.—The minute of agreement between the Council and the Duke of Richmond and Gordon as to laying electric mains along public roads in Fochabers has been signed.

St. Mellon's.—The District Council have appointed a committee to meet the promoters of the scheme for electrically lighting the Rhymney Valley in the area of this council's district.

Hammersmith.—The premises of 29 additional consumers, representing a maximum of 652 8 c.p. lamps, have been connected to the mains, the present number of consumers taking current being 1,690.

Heywood.—The electrical engineer in his last report stated that the consumption of electricity for the month of August was 3,971 units, as against 3,199 units for the corresponding period of last year, showing an increase of 772 units.

Electric Furnaces.—Messrs. Marryat and Place, 28, Hatton-garden, E.C., inform us that the 1,000-ampere electric furnace they are exhibiting at the Olympia Exhibition has been purchased by the National Physical Laboratory, Teddington.

Goole.—The Goole branch of the Amalgamated Society of Railway Servants are urging upon the Council the necessity of taking prompt measures to ensure the proposed electric lighting scheme being worked for the town and for the benefit of the townspeople.

Stanley (Yorkshire).—The Urban District Council have approved of the proposed lighting scheme recommended by the Lighting Committee. This will involve an outlay of £1,175 and an annual expenditure of £642. About 14½ miles of roads will be lighted.

Battersea.—Owing to the failure of the armature of the turbine generator, the district was plunged in darkness for some time between 9 and 10 last Saturday. The supply was soon started again, section by section, but not before the pickpockets had secured a rich harvest.

Clydebank Dock.—At Clydebank Dean of Guild Court on Tuesday permission was granted to the Clyde Navigation Trustees to erect an electricity generating station for the working and lighting of Clydebank Dock. The main building will be 109ft. by 120ft., and the chimney stack will be 150ft. high.

Wisbech.—The Council, whose first electric lighting provisional order has expired, propose to apply in the ensuing session of Parliament for a further provisional order. Negotiations are to be opened with some company for the supply of electric energy within the borough providing terms can be agreed upon.

Harrow.—The Council have received an application from the Post Office for permission to make a telegraph extension from Sudbury to Harrow road. It appears that the land in question belongs to the freeholders on either side of the road, and the matter has been referred to the Works Committee to investigate.

Stepney.—The London County Council recently sanctioned the borrowing of £57,000 for the extension of the power-house at Osborn-street, and the purchase of additional steam and electricity generating plant. A further instalment of £10,000 is to be borrowed in order to meet capital commitments to the end of the financial year.

Callender's Cable and Construction Co.—The directors have decided to pay an interim dividend on the ordinary shares of this company on Nov. 1 next of 5s. per share, being at the rate of 10 per cent. per annum. The books are closed to the 31st inclusive for the purpose of preparing this dividend.

Western Telegraph Co.—The directors recommend a final dividend of 3s. per share, making a total dividend of 6 per cent. for the year ended June 30 last, and also the payment of a bonus of 2s. per share, both free of income tax. The sum of £60,000 has been transferred to the general reserve fund, and £5,000 to the maintenance ships' reserve fund.

Western Telegraph Co.—The directors have, after transferring £60,000 to the general reserve fund and £5,000 to the maintenance ship's reserve fund, decided to recommend a final dividend of 3s. per share, making with previous distributions a total of 6 per cent. for the year ended June 30, 1905. They also recommend a bonus of 2s. per share.

Willington.—The County of Durham Electric Power Distribution Co. have written to the Urban District Council regretting the Council thought the time inopportune to consent to their application, and asking them to reconsider the question. We expect nothing further is to be done at present, as the clerk has been directed merely to acknowledge the receipt of the letter.

Morecambe.—At the last Council meeting it was decided that the best thanks of the committee be accorded to Mr. W. H. Hall, the electrical engineer, for the efficient result of the year's working. Last year there was an increase in the gross profit from £1,798 to £2,155. There has been a reduction of 14 per cent. in the general works cost, from 3·31d. to 2·85d. per unit sold.

Digitized by Google

Bo'ness.—The question of the difference between bank interest on principal deposited and interest paid to the lenders through the instalments of the loan not being taken up as anticipated, and also the matter of supervising engineer to act for the Council at a yearly inspection of the electric lighting works, was again discussed at the last Council meeting and further adjourned.

Liverpool.—During the past year the equivalent number of 16-c.p. lamps connected to the electric supply mains has increased from 277,767 to 310 562, and the number of consumers from 5,345 to 6 821. The amount of electrical energy supplied for lighting and power shows an increase of about 6 per cent. over last year, and 5·75 per cent. increase in electrical energy supplied for tramways.

The Seychelles.—The Colonial Office report for 1904 on the Seychelles Islands refers to the projected improvement in the supply of water to the town of Victoria, and states that a high-level reservoir at 600ft. above the town might be further utilised by means of a Pelton wheel or turbine to generate sufficient horse-power to light the town by electricity and supply mechanical power to the public works yards.

Walsall.—The last report of the Electricity Committee shows that the total number of consumers supplied on Sept. 30 last was 432. During the past month the total units generated at the station was 135,525. The total output from the main generators was 131,004 units, and that from the transformers 101,686 (estimated). The machinery was run for 707 hours. The wages paid amounted to £130.

Croydon.—Further consideration of the report on street-lighting has been adjourned to a future meeting of the Council, and in order that the matter may be fairly considered the Lighting and Electricity Committee have been requested to obtain from the Croydon Gas Co. and from the South Suburban Gas Co. respectively offers for the efficient lighting of the borough, and to submit such offers to the Council.

Stock Exchange.—Application has been made to the Stock Exchange Committee to allow Lisbon Electric Tramway' 500,000 ordinary shares of £1 each, fully paid, Nos. 1 to 500,000, 425,553 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 425.553, and £500 000 5 per cent. mortgage debentures of £100 each, Nos. 1 to 5 000 (registered, renewed special application), to be quoted in the official list.

St. Marylebone.—The costs incurred and paid up to the present—£681. 12s. 8d.—in opposing the various electric companies' Bills have been transferred from the electricity to the general account. A further loan is required on capital account of the electricity undertaking, and application will be made to the London County Council for an advance of £90,405. being the balance of the amount of £340,455, the borrowing of which has been sanctioned for 42 years.

Bermondsey.—The last report of the Electric Lighting Committee gives the number of lamps now connected as 51,383 lamps for private consumers and the equivalent of 4 622 lamps for public lighting, a total of 56,005 lamps. The following extension of plant has been recommended: steam dynamo of 500 kw. capacity, £2,950; switchboard extensions and connections, £325; boiler capable of evaporating 12 000lb. water per hour, £1,800; steam-pipe and exhaust connections, £215; contingencies, £100—total, £5,390.

Our Navy and our Army.—Mr. Alfred J. West on the 16th inst. commenced his eighth annual series of the popular entertainments illustrating "Life in our Navy and our Army" at the Polytechnic, Regent-street. The programme for the current season will be entirely new to London, though it has been given with very great success in the provinces, particularly on the occasion of the recent visit of the French fleet to Portsmouth, when a special matinée was arranged for the officers and men.

Grimsby.—The Corporation Lighting Committee have agreed to an application from a would-be consumer of electricity, who asked the Corporation to supply him with current to drive a motor used, amongst other purposes, for driving the small dynamo of his own private electricity installation. The engineer thought that they were creating a dangerous precedent, but the committee granted the application on the ground that, the premises being wired for 100 volts, the applicant could not take the Corporation lighting current at 230 volts without rewiring his works.

Finchley.—At the last Urban District Council meeting a statement was made regarding the electric light revenue account, which shows at the moment a debit of £1,858. This is accounted for by the fact that the consumers' accounts for the quarter ending September are all outstanding. The accounts are now being issued, and, when paid, will more than cover the amount of the debit balance. There are the three accounts in debit. On the other side there are 16 accounts in credit to the amount of £8,208, so it must be admitted that the bank balances are in a satisfactory condition.

Maxim Electrical Co.—We have been asked to point out that this company is no way connected with the old company, bearing a similar name, and that the Maxim arc lamp has been exclusively adopted for all the stations of the Underground Electric Railway Co., after an extended trial in competition with others. The company have been working overtime for some weeks on account of repeat orders from the Underground. These lamps have also been installed at the L.S.W. Railway Station at Waterloo. The firm's incandescent lamps has been adopted at Glasgow and other places in preference to others.

Greenock.—Application is to be made shortly for further borrowing powers for the electricity department. The electricity generated during August amounted to 200,662 units, an increase of 73,921 as compared with the corresponding month of last year. With regard to a proposed supply of electricity to the new cottage hospital about to be erected in Port Glasgow, the Corporation have declined to furnish a supply, but if the applicants approach the Corporation of Port Glasgow for a general supply to that burgh they thought arrangements might be made for giving such on terms to be arranged by the Corporation.

London Gazette.—The partnership between Newman Wilkinson and Horace Francis Simon, electrical engineers, 43, Mincing-lane, London, has been dissolved by mutual consent. A receiving order has been made out on debtor's petition in the estate of Thomas Hill, electrical engineer, 24 Vicarage-road, Wolverhampton. The partnership between Percy Joseph Driscoll and Charles Balbiani, electrical engineers, 33. Portland-street, Wardour-street, London, has been dissolved by mutual consent. The last day for receiving proofs in the estate of Fred Shaw, electrical contractor, Hessle-road, Kingston-upon-Hull, is Nov. 2.

Switchboard Panels.—Manufacturing electrical engineers visiting the Olympia Exhibition would do well to look at the slate and marble switchboard panels which have been made by Messrs. Congden and Powell, of Bravington-road Works, Harrow-road, W. The firm are not themselves exhibiting, but their material is used on the switchboards shown by Messrs. Ferranti, J. E. Spagnoletti and Co., Crompton and Co., etc. The workmanship on these slabs will be appreciated, but, unfortunately, a casual glance does not reveal that uniformity which is the great feature claimed for the panels either of slate or marble supplied by this firm.

Changes of Address.—We are informed that in future the business address of Mr. C. C. F. Monckton, M.I.E.E., electrical engineer to the Government of Trinidad, will be 53, Victoria-street, Westminster. The Glasgow office of the Union Electric Co. has been transferred to 12, Waterloo-street, Glasgow, and is in charge of Mr. Alexander Morrison, who is the company's representative for Scotland. Mr. Morrison has had very considerable experience in the heavier lines of electrical engineering, having served his time with Messrs. Mavor and Coulson, after which he was in the employment of Messrs. Haddow and Co., the Glasgow contractors, and in the tramways department of the Glasgow Corporation.

Ferranti Limited.—A trip was arranged for the employés of Messrs. Ferranti to visit Olympia Electrical Exhibition on Saturday last, a party of 170 men leaving Manchester at midnight on Friday by the Great Central Railway. Messrs. Ferranti contributed towards the general expenses of the trip, provided breakfast on arrival in London and a luncheon in the restaurant of the exhibition, at which the directors of the company were present. Each man was furthermore supplied with a pass to the exhibition. Some of the party returned on Saturday evening, while others deferred their departure until the following day. The trip was eminently successful, and will, it is hoped, prove to be of educational advantage to the employés of the firm.

Blackpool.—The electrical engineer (Mr. C. Furness) has reported that the returns for the month of September showed an increase in the total works output over the corresponding month of last year of 15,152 units, made up as follows: private lighting, 136,678 (increase, 8 180); public lighting, 19,491 (decrease, 492); Corporation trams, 119,774 (increase, 6 253); Lytham and St. Annes trams, 10,191 (increase, 1,211)—total for month, 286,154 (net increase, 15,152). For the half-year ending Sept. 30, 1905, as compared with the output for the corresponding half-year in 1904, the figures are as under: private lighting, 560,072 (increase, 23,545); public lighting, 80 069 (decrease, 4,347); Corporation trams, 705,076 (increase, 48,285); Lytham and St. Annes trams, 59,426 (decrease, 451)—total for half-year, 1,404,643 (net increase, 67,132); new consumers (half-year), 42.

London County Council.—On Tuesday tenders were received for the supply and delivery of steel girder tramway rails, with fastenings, required in connection with the reconstruction for electrical traction of certain of the Council's tramways. It was agreed to lend the St. Pancras Borough Council £1,874 for electric lighting, and the Woolwich Borough Council £16,275 for electric lighting purposes. The proposal with regard to free wiring has now been put into the following form: "That application be made to Parliament in the session of 1906 for powers to enable local authorities in London who have now, or may hereafter obtain, powers to supply electrical energy, to wire and fit consumers' premises for the use of electrical energy, and to obtain loans for this purpose. The following inspectors have been appointed under the Woolwich Electric Lighting Order, 1905, and the Act confirming that order: T. P. Gunyon, H. W. Ridley, A. Champion, W. T. Hodgson, A. H. Sears, and T. W. Graves. Additional high-tension feeder cables, estimated to cost £5,300, are required for the Elephant and Castle tramways sub-station.

Birmingham.—The Electric Supply Committee have decided to recommend to the City Council the following new rates of charges for lighting and private power supply: Lighting—for the first 300 units per quarter, 5d. per unit; any quantity used in excess of this per quarter, 3½d. per unit. Power—for the first 300 units per quarter, 2d. per unit; for any quantity used in excess up to 3,000 units per quarter, 1½d. per unit; for any quantity used in excess of 300 units if more than 3,000 units are consumed during the quarter, 1½d. per unit. The charges per unit for an all-day supply for lighting purposes will remain as at present—viz., 3d. per unit for the first 300 units per quarter, and 2d. per unit for any quantity used in excess, subject to a guarantee of 25s. per 16-c.p. lamp per annum for a minimum number of 12 16-c.p. lamps installed. A special discount of 3 per cent. off all the above charges is allowed if the account is paid within a specified time. These recommendations will be submitted by the committee in their report to the City Council at the December meeting. The charges proposed by the committee for the supply of the tramways inside the city boundary have been approved by the Tramways Committee. Under the scale agreed upon the charge for the first 4,000,000 units per annum is to be 1½d. per unit net, for the second 4,000,000 units per annum 1½d. per unit net, and for any quantity taken in excess of 8,000,000 units per annum 1d. per unit net. A proposal to supply electric motors on hire is also under consideration.

Digitized by Google

Bolton.—The electric supply fund account for the year ending March 31, 1905, shows a total expenditure of £34,827, an income of £38,975 and a net profit transferred of £4,148. The expenditure includes the following: generation of electricity, £11,718; distribution of electricity, £285; rents, rates, and taxes, £1 412; management expenses, £1 420; interest account, £7,283; depreciation account, £12.708. The separate section income is: sale of electricity, £37,390, which sum includes £14,588 for tramway traction at 1·1d. per Board of Trade unit; rental of hired meters, £339; rental of hired motors, £715; and electric fittings trade, £529.

Caversham.—The Highways and Lighting Committee, after meeting the representatives of the Reading Electric Supply Co. on the subject of the supply of electrical energy in Caversham, have recommended the Council to adhere to their resolution to take such steps as may be necessary to obtain a provisional order from the Board of Trade authorising them to supply electricity for any public or private purposes within the urban district of Caversham. This has been confirmed. The principal reason for this decision was, we hear, the fact that at the end of nine years the Reading Corporation have the option of buying up the Reading Electric Supply Co.'s undertaking, and they might then force the hands of the Caversham authority in the matter. Six more lamps are to be erected in the Woodcote-road.

Handsworth.—The new electric light and power station at Piers-road which is to supply Handsworth with illumination and motive power was formally opened last week by Councillor F. Tibbitts, chairman of the Electric Supply Committee. The scheme has cost between £49 000 and £50,000, and future extensions have been taken into account. The present provision is for three watertube boilers, each capable of evaporating 6,000lb. of water per hour at a pressure of 200 lb per square inch. There is room in the present boiler-house for four more similar boilers. The engine room is ample for a 1,700-h.p. plant. At present there are installed four high-speed engines—two of 200 h.p. each and two of 150 h.p. each. Each of the smaller engines drives two dynamos, while the large engines each drive a single dynamo. The large dynamos are compound-wound. A large number of arc lamps has been provided for the public lighting of the main thoroughfares; each pillar carries two incandescent lamps on brackets for after midnight lighting. Sir Alexander B. W. Kennedy was the consulting engineer, and Messrs. Henman and Cooper the architects.

Hampstead.—At the meeting of the Borough Council last week the Lighting Committee reported that they had carefully considered the reference from the Council to inquire into the charges and system of charges to the public for electric light, and also the question of reducing the charges for current for private lighting. The committee had received reports on the subject from Mr. G. H. Cottam, the chief electrical engineer, and Mr. C. E. Moon, the borough accountant. They found that the present method of charge for current is by the demand indicator system, and is at the rate of 6d. per unit for one hour's average maximum consumption per day per half-year, and 2½d. per unit for all units beyond that quantity consumed during the half-year, the average maximum demand being the average of the readings of the indicator during the three dark months of the half-year. The profit upon the electric lighting undertaking for the year ended March 31 last, after deducting the sum of £2,000 contributed in aid of the rates, was approximately £7,000. They considered, from the figures placed before them, that the Council would be justified in making a reduction in the charges for current for lighting to private consumers, and they had considered several methods of so doing—viz., continuing the demand indicator system at reduced charges, charging a flat rate for current, and reducing or abolishing the meter rents. They had caused inquiries to be made as to the methods of charge for electrical energy by other metropolitan borough councils, and they found that the same were as follows: Poplar—maximum demand system; Stepney—maximum demand system for lighting, flat rate for power, heating, etc.; Battersea and Fulham—flat rate only; Bermondsey, Islington, St. Pancras, Shoreditch, and Southwark—optional flat rate; Hackney—recently changed to maximum demand system, but optional flat rate to old consumers; Hammersmith—maximum demand system to Sept. 30, 1905, then abolished and flat rate substituted. The committee were of opinion that it would be advisable to afford private lighting consumers the option of being charged on the maximum demand system or at a flat rate, and, therefore, they recommended that after consumers' meters have been read in December next, and the accounts rendered thereon at the rates now in force, consumers be given the option of declaring upon which of the following systems they will be charged for current for private lighting: Maximum demand system—during the two winter quarters, October-December and January March, at 6d. per unit for the first two hours' maximum per day, and 1½d. per unit for all current consumed beyond that quantity during each winter quarter; all current consumed during the two summer quarters, April-June and July-September, to be charged at the uniform rate of 1½d. per unit. Flat rate system—for all units consumed for private lighting at the uniform rate of 4d. per unit. The committee further recommended that no alteration be made in the charges for current for heat and for power, or in the charges for public lamps, and that the question of making any alteration in the meter rents do stand over for the present. The recommendations were adopted. The following is an explanation of the maximum demand system proposed: For each winter quarter the ordinary meter will be read and the total number of units consumed during the quarter noted. The demand indicator records the maximum rate at which current is consumed at any moment during the quarter, this being equivalent to the maximum number of lamps on at one time. The number of units which would have been consumed had this maximum demand been maintained for two hours during each day of the quarter—that is, for 182 hours per quarter—will be charged at 6d. per unit. The balance of the number of units recorded by the ordinary meter will be charged at 1½d per unit. During the two summer quarters the demand indicator will be disregarded, the ordinary meter only being read. With regard to wiring of consumers' premises, it was agreed not to support the clauses proposed by the London County Council should another attempt be made to obtain the powers referred to. At the same time the Council are prepared to support a clause making it lawful for borough councils to expend money upon wiring consumers' premises, provided that the work be done through a contractor. The agreement with the General Post Office for an additional exchange line with internal extensions at the town hall in the place of the National Telephone Co.'s line and extensions has been signed.

Camberwell.—Last evening the mayor opened the new swimming, slipper, Turkish, and Russian baths erected by the Borough Council in the Old Kent-road at a cost of about £56,000. Mr. E. H. Payne was the architect, and Mr. A. N. Coles the contractor for the building. The whole of the engineering work was designed by Mr. W. M. Binny, A.M.I.C.E., of Teddington, who acted as consulting engineer for the architect, and also supervised the erecting of the machinery. In arranging this scheme of engineering it has been sought to arrange it, as far as practicable, in such a manner that the success of one operation shall not be altogether contingent upon another, and for alternative machinery to be brought into use when it is necessary to clean or repair any particular machine. Advantage has also been fully taken of making use of the by-products or exhaust steam from the electric light and laundry engines, air compressors, pumps, etc., for the purpose of heating the water used in the baths, wash-houses, and laundries, as the greatest part of the steam required to be generated by the boilers is ultimately used for the purpose of heating water, etc. By first using the live steam in driving the various engines and pumps, and afterwards utilising the exhaust steam for heating, the cost of fuel for generating power is practically nil. The public wash-house and ironing room are situated on the ground floor, and under them on the basement floor are the engine and boiler rooms, workshop, and establishment laundry, containing all the principal parts of the machinery very compactly arranged for generating power, so that the engineer and his assistants can easily supervise the working of the plant without leaving their special quarters. The engineering work has been divided up into various sections, the contracts for which have been let in each case to firms who make a speciality of that particular branch, and without the intervention of a general engineering contractor. In the boiler-room are three boilers of the Lancashire type, each 7ft. 6in. diameter, constructed of steel, for a working pressure of 100lb. per square inch, two of which would be in use at the same time, the third being laid off when required for cleaning and repairs. These boilers were supplied by Messrs. Galloways, Manchester. The feed water for the boilers is softened and freed from scale-forming matter by means of a water softener situated on the roof. This was supplied and fixed by Messrs. Lassen and Hjort, Queen Victoria-street, and is capable of treating 2 000 gallons of feed water per hour. The feed water after being softened is pumped into the boilers by means of two vertical duplex type feed pumps, one of which is alone capable of doing the work, the other being available as a stand-by. These pumps were supplied by Messrs. Carruthers, Glasgow. In the engine-room is situated the laundry engine for driving all the shafting in the premises, and is of the vertical enclosed type, fitted with a system of forced lubrication for automatically oiling all the working parts while running. This engine was supplied and fixed by Messrs. Allen, Son, and Co., Bedford, who also supplied and fixed the electric light engine and dynamo of 30 kw. capacity, capable of lighting the whole of the premises. The working parts of both the laundry and electric light engines are specially arranged so as to be interchangeable, thus simplifying repairs and working. There are also arrangements made for changing over the electricity supply from the electric light engine to the company's supply, so as to conform with the London County Council's requirements for licensed premises, and also to enable the electric light to be used after the machinery is stopped for the night. The wiring and fittings of the electric lighting have been specially arranged in separate circuits to conform to the London County Council's requirements for licensed premises, and are arranged so that alternative use can be made of the steam-engine and dynamo in the engine-room, or from two sources of supply on the company's mains. Change-over switches are provided, so that the whole or any part of the premises can be lighted from either the company's supply or from the engine and dynamo, or a part from each. The wiring and fittings of the electric light have been arranged in the slipper baths and other places so as to be well out of the reach of the bathers, so as to prevent any possibility of accidents. The main controlling arrangements and switchboards are situated in a special room in the basement, out of the reach of unauthorised persons, and consist of three main panels, each fitted with a voltmeter and ammeter, main switches, fuses, etc. These panels are supplied with current either by the company or from the engine-room switchboard. From the switchroom the principal sub-circuits are carried to sub-distribution boards in various parts of the building. The contractors for the electric wiring and fittings were Messrs. H. M. Leaf, 47, Victoria-street, Westminster. The specification of the wiring was prepared by Mr. Morgan Williams, M.I.C.E., 39, Victoria-street, Westminster, who collaborated with the consulting engineer.

PROVISIONAL PATENTS, 1905.

OCT. 9.

20330. Improvements in arc lamp electrodes. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Allgemeine Elektricität s-Gesellschaft, Germany.)

20335. Improvements in protective devices for use in the distribution of electricity by overhead wires. James Robson, 3, Devonshire-place, Selly Park, Manchester.

Digitized by Google

20347. Apparatus for mechanically and electrically controlling the working of overhead and rail points on electric railways and tramways. Adolf Lutgarten and John Griffith Jones, 577, Stretford-road, Old Trafford, Manchester.

20368. Improvements in or relating to single-phase commutator motors. Valere Alfred Fynn, 70, Chancery-lane, London.

20371. Improved apparatus for sound transmission by means of electrically-produced light and heat rays. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens-Schuckertwerke, G. m. b. H., Germany.) (Complete specification.)

20392. Improvements in or relating to electric motors Alphonse Ferdinand Pieper, 111, Hatton-garden, London. (Complete specification.)

OCT. 10.

20402. Improvements in direct-current dynamo-electric machines and motors. Albert Henry Midgley and Benjamin Reed, 128, Southwark-street, London.

20435. Improvements in flame carbon arc lamps. Veritys Limited and Frederick Stanhope Worsley, 11, Burlington-chambers, New-street, Birmingham. (Complete specification.)

20441. Improvements in inclined carbon arc lamps Veritys, Limited, and Frederick Stanhope Worsley, 11, Burlington-chambers, New-street, Birmingham. (Complete specification.)

20467. Improved signalling apparatus for single-line sections of electric railways and tramways. Charles Denton Abel, Birkbeck Bank-chambers, Southampton-buildings, London. (Siemens-Schuckertwerke G. m. b. H., Germany.) (Complete specification.)

20496. Improvements in or relating to telephones and telephone systems. Alfred Julius Boult, 111, Hatton-garden, London. (Charles E. Egan, United States.) (Complete specification.)

20500. Improvements in mercury electrolytes. Henry Stafford Hatfield and the Reason Manufacturing Company, Limited, Norfolk House, Norfolk-street, Strand, London.

20512. Improvements in or connected with the caps and contacts of electric incandescent lamps. Matthew Favero, 40, Chancery-lane, London.

20515. Improvements in electric arc lamps. William James Davy, 40, Chancery-lane, London.

OCT. 11.

20542. Improvements in electric cooking apparatus. Henry Bevis and Charles Herbert Archer, Peel Works, Adelphi, Salford, Manchester.

20547. Improvements in a system for the transmission of electric currents. Isidor Kitsee, 18, Fulham-place, Paddington, London. (Complete specification.)

20548. Improvements in the transmission of intelligence with the aid of electric energy. Isidor Kitsee 18, Fulham-place, Paddington, London. (Complete specification.)

20593. Improvements in annunciators for telephones Alfred Laurentius Peterson, 6, Lord-street, Liverpool. (Complete specification.)

20595. Improvements in and relating to electric switch fuses. Claude William Atkinson and Edmund Garside, 1, Queen Victoria-street, London.

20599. Improvements in and relating to electric switches or cut-outs. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (General Electric Company, United States.)

20609. Improvements in electric arc lamps. Frank Michael Lewis, Norfolk House, Norfolk-street, Strand, London.

OCT. 12.

20657. New or improved duplex telegraphy. Alfred Minkley and Walter John Bakewell, 89, Clarence-road, Derby.

20666. Improvements in electrical distribution systems. George Croydon Marks, 18, Southampton-buildings, London. (John Roberts, Cape Colony.)

20687. Improvements in safety devices for overhead electric conductors. Emile Giraud, 47, Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, Oct. 31, 1904, being date of application in France.) (Complete specification.)

20690. Improvements in electrical block signalling apparatus. James McIlwain and Charles Anderson Bennett, 53, Chancery-lane, London.

OCT. 13.

20728. Improved means for facilitating the erection of telegraph poles and the like. John Ridsall Brown, 55, Market-street, Manchester. (Complete specification.)

20737. Improvements in insulating materials for covering electric cables and the process for making same. Harris Markus and the Barnwell Machine Company, Limited, Droylsden Rubber Works, Droylsden, near Manchester.

20742. Improvements for hand-operated brakes on electrically-driven cars. Fitz-Roy Owen Jonathan Roose, 18, Vincent-square-mansions, Westminster, London.

20749. Improvements relating to overhead current collectors for electric railways and tramways. Siemens-Schuckertwerke G. m. b. H., 12, Queen Anne's-gate, Westminster, London. (Date applied for under Patents Act, 1901, Oct. 27, 1904, being date of application in Germany.) (Complete specification.)

20756. Improvements in or relating to the suspension of rotating apparatus and magnetic compasses. Hermann Anschutz-Kaempfe, 111, Hatton-garden, London. (Date applied for under Patents Act, 1901, March 25, 1904, being date of application in Germany.) (Complete specification.)

20769. An improvement in the application of alternating current to electro-metallurgy. Vladimir Mitkevitch, 10, St. George's-crescent, Liverpool. (Complete specification.)

20770. Improvements in cathodes. Henry Stafford Hatfield and the Reason Manufacturing Company, Limited, Norfolk House, Norfolk-street, Strand, London.

20772. Improvements in alternating-current collector motors. Actien-Gesellschaft Brown, Boveri, et Cie., 46, Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, Oct. 17, 1904, being date of application in Switzerland.) (Complete specification.)

OCT. 14.

20805. Improvements in or in connection with trolley poles of electric tramcars and like vehicles. Arthur Entwistle and Edwin Entwistle, 3, Brown-street, Market-street, Manchester.

20814. Improvements in the mariner's compass. James Kean, James Spiers, and Kelvin and James White, Limited, 154, St. Vincent-street, Glasgow.

20819. Improvements in and relating to the application of rotary electric motors to work certain to-and-fro movements, and in a gearing device and a pump and a fluid motor with which the same can be effected. George Hudleston Hurlstone Hardy, 35, Park-road, Twickenham, Middlesex.

COMPLETE SPECIFICATIONS ACCEPTED.

NOTES.

The Franklin Institute.—We have received the October number of the *Journal* published by the Franklin Institute, Philadelphia, and among the contributions are papers on "The Alternating-Current Generator," by Mr. David B. Rushmore; "Sanitary Protection of Water Supplies," by Mr. Kenneth Allen; and a second instalment of the article on "Mica and the Mica Industry," by George Wetmore Coles.

Obituary.—Members of the Institution of Electrical Engineers and all other friends of Mr. F. H. Webb, its late secretary, will be sorry to hear of the sad loss sustained by him on Monday last, when Mrs. Webb passed away quite suddenly. We are quite sure that the sympathy of their friends will go out to Mr. Webb and the family in this their hour of trial. The funeral will take place at Hampstead to-morrow at two o'clock.

American Physical Society.—The issue for October of the *Physical Review* contains articles on the "Specific Heat of Gases at High Temperatures," under the joint authorship of Mr. L. Holborn and Mr. L. W. Austin; "The Quadrant Electrometer as used for Measuring Current" and "The Luminescence of Sidot Blende," by Mr. E. L. Nichols and Mr. Ernest Merritt, together with the first instalment of an article on "The Joule-Thomson Effect in Carbon Dioxide."

Electric Mining Rules.—We have received from Messrs. W. T. Glover and Co., Limited, of Manchester, a handy little book containing some regulations and data which cannot fail to be of use to those interested in the application of electricity to mining. The first part deals with the rules to be observed in the mine, and is followed by the report of the commission which sat to inquire into the use of electricity in mines. Numerous illustrations of joint-boxes, fittings, etc., suitable for this class of work are also given, and together with other data and notes on cables sections and mining cables form an important feature of this interesting booklet, which should be acquired by all who are concerned with electrical work in mines.

Wireless Telegraphy.—We mentioned last week that two ships of the Aberdeen line had been fitted up with an apparatus for wireless telegraphy. There are evidences of the extension of the system in many directions. The latest town to have a station installed is Norddeich, in Germany, on the North Sea. The area covered by its operations will have a radius of over 900 miles, and will include Germany, Austria, Switzerland, France, Great Britain, and Denmark, as well as the greater part of Italy, Sweden and Norway, and portions of Spain, the Balkan Peninsula, and Russia. The station is being equipped with the Telefunken system by the Wireless Telegraphy Company of Berlin, and will have towers nearly 60 yards high. It is expected to be in working order early in the coming year.

Radium.—As a result of experiments, an interesting discovery has been made by Mr. F. Soddy which furnishes new evidence in support of the now generally accepted view that one element can, under certain conditions, be transformed into another. A solution containing over 2lb. of uranium nitrate was freed from all radium that it contained by repeated precipitation, and was then kept for 18 months in a closed bottle. It was examined from time to time, and was found to have gradually acquired the power of emitting an emanation absolutely identical in characteristics with that given off by radium. Hence the conclusion was arrived at that the uranium was very gradually transformed into radium, though only traces of the latter substance were present in the solution at the end of the period of observation.

Italian Government and Wireless Telegraphy.—The Italian Government, in inviting tenders for work at Coltano Station, have definitely embarked upon the Marconi system of wireless telegraphy by refusing to permit compulsory exchange of messages between it and other systems. In a letter to Mr. Marconi, the Minister of Posts and Telegraphs says that the Ministry, in thus putting into execution the Bill twice approved by Parliament, is also convinced of the value of the conditions entered into and also grateful to the illustrious Italian who generously conceded to his country the use, without compensation, of the extraordinary fruits of his genius.

Books Received.—"Berechnung und Ausführung der Hochspannungs-Fernleitungen," by Carl F. Holmboe (Julius Springer, Berlin. 3s.). This little work deals with the transmission of high-tension current over long distances applicable to railways, telegraphs, and telephones. It is primarily intended for students in higher technical schools and for those already in practice who wish to instruct themselves in alternating-current work.—"The Mechanical World Pocket Diary and Year Book for 1906" (Manchester. 6d. net). We have received the nineteenth annual issue of this pocket book. A large amount of new matter has been introduced, and a section is devoted to an account of the steam-turbine, specially prepared by Mr. R. M. Neilson. The book retains all its old features, and, together with the new sections introduced, should be serviceable to the engineer.

Institution of Civil Engineers.—The usual reminder card giving the list and dates of the meetings of the institution has been issued to members. The institution will commence its eighty-seventh session on Nov. 7, when the president, Sir Alexander R. Binnie, will deliver his inaugural address, and this ought to prove exceedingly interesting, for the president is one of those engineers whose experience is very extensive, and he has consistently been successful. Among the subjects which will be brought forward in papers during the session for instruction and discussion will be "Waterways in Great Britain," "The Widnes and Runcorn Transporter Bridge," "The Steam-Turbine," "Heat Economy in Factories," "The Railway Gauges of India," "The Outer Barrier, Hodbarrow Mines,' and "The Heysham Harbour Works." The dates when these particular papers are to be read will be announced, as they are settled, in the usual way.

Wireless Telephony.—Experiments with a view to working out improvements on the present system of wireless telephony and telegraphy will be taken in hand in America by Dr. O. T. Cruikshank and Mr. Thos. F. Jack as soon as the apparatus which the latter has prepared can be installed. Mr. Jack has been working for several years on a system of wireless telephony, and has completed all his experimental instruments and apparatus. Receiving instruments will be located on the tops of the houses of each of the experimenters, which are situated one-eighth of a mile apart, one of them being 300ft. higher than the other, and messages will be transmitted by wire to a room in one of the houses. The only progress made so far with wireless telephony was by an electrician who, by talking into the shunt field of a direct-current generator, using an ordinary telephone appliance, was able to transmit sound 10 miles. Mr. Jack has succeeded in constructing an entirely different system from the one described above.

Bangalore.—A difficulty has arisen as to the provision of supply of current for lighting in Bangalore, which reveals the absurdity of the divided control of supply over certain areas. An electric lighting installation was recently

Digitized by Google

opened in the city, which receives its current from a local sub-station, the sub-station depending in turn on the generators at the Sivasamudrum works at Cauvery Falls. The adjacent civil and military station is illuminated at night by oil lamps. The question arises as to who will undertake the supply. The Mysore Government are prepared to sell their surplus power in bulk to either the station, municipality, or to a local supply company, did such exist. Private enterprise, however, holds aloof from this field, and the municipal authorities have so far taken no action in the matter. It is probable that some time will elapse before a settlement will be arrived at, consequently the inhabitants will be put to no little inconvenience in having to wait for the electrical illumination of their streets and bungalows.

Ice in Water-Power Plants.—A device used by the Ottowa Electric Company for keeping ice off the racks in water-power plants was described at a recent convention of the Canadian Electrical Association. It was designed by Mr. W. H. Baldwin, superintendent of the hydraulic works of the company. The ice rake consists of a metal rake attached to a wooden beam about 5in. square and 20ft. long. To this rake an up-and-down motion is given by means of a small motor. This motion causes the rake to scrape the ice rack from top to bottom and from bottom to top, the lever being balanced so that gravity keeps the rake in contact with the rack. The rake and driving motor are mounted on a small truck running on a track at the top of the platform. The rake travels up and down at the rate of 100ft. per minute. Power is transmitted to it from the motor through friction cones, bevel gearing, and a chain and grooved wheels, the chain being fastened to the rake beam. We are indebted to the *Electrical Review* of New York for the above description of the device, which was communicated to the convention by Mr. A. A. Dion.

Electric Wires and Fires.—It is usual in the case of a fire whose origin is not easy to determine to suggest that the electric wires were the cause. At Bridgewater House, which was recently the scene of a great conflagration, a conference was held with the concurrence of the Commercial Union Fire Office, attended by Mr. Phipps, (secretary to the owner of the house, Lord Ellesmere), the consulting electrical engineers (Messrs. O'Gorman and Cozens-Hardy, represented by Mr. O'Gorman), and Messrs. Hancock and Rixon, to whom the electrical wiring had been entrusted, with a view to inquiring into and determining the cause of the fire. It appears that internally-insulated screwed steel conduit had been used; that there was absolutely no damage to the steel conduit; that there had been no arcing and no wires melted inside the conduit; and that the roasting given to the rubber had been caused by external heat. It was agreed that electricity could not have been the cause. On the other hand, a lead gas-pipe which was found in a partially melted condition near the fireplace is thought to have been the probable cause of the fire. A minute gas leak occurring near a ventilating duct which was also discovered in the floor would cause no smell of gas, but if ignited would slowly melt an ever-increasing hole in the lead tube, and eventually a full blast of lighted gas playing on the timbers would easily account for the fire.

Lucknow Electric Tramways.—A license has been granted by the municipal authorities to the British Eastern Electric Power Company sanctioning the construction of an electric tramway within the Lucknow municipality. The tramway is to be 3ft. 6in. gauge, and is granted subject to the usual conditions being complied with. The maximum speed permitted is not to exceed eight miles per hour on frequented thoroughfares. One of the clauses in the agreement provides that, subject to confirmation by the Local Government Board, the company may manufacture, supply, and distribute electric power within the municipal limits for house and street lighting, together with the right to construct buildidgs, erect machinery, lay electric cables and wires, either overhead or underground. The Municipal Board has also the right to require the licensees to supply current for lighting the roads along which the tramways run at 5 per cent. less than the price charged to ordinary customers. The lamps and posts for this purpose are to be erected at 5 per cent. less than the market price charged for this class of work. The price to be paid by the company to the municipality for the privilege of working the tramways is to be one-fourth of the amount exceeding 5 per cent. of the revenue upon the capital outlay. The agreement stipulates that the original outlay of the company shall be ascertained on the completion of the construction of the tramways, and additions shall from time to time be taken into account. In addition to the outlay, a fair proportion shall be charged for wear and tear and depreciation of rolling-stock in estimating each year's profits.

Municipal Electrical Engineers.—Strong representations are being made to the Local Government Board with a view to inducing that body to allow the expenses of delegates attending conferences of the Municipal Electrical Association and similar institutions. The matter has been taken in hand at the instigation of the St. Annes-on-the-Sea Urban District Council, in consequence of the district auditor having disallowed the expenses of their electrical engineer attending the conference of the above-named society, and having signified his inability to allow such payments in the future unless the association received the official recognition of the Local Government Board. The councils consider that it is highly desirable for the chairmen of their electricity committees and their chief engineers to attend the annual conferences of the association, as much benefit accrues to local authorities consequent upon being represented at the deliberations of the society and perusing its various publications. Having regard to the great importance which attaches to the efficient and economic working of municipal electrical systems, and the vast sums of public money absorbed therein, it is essential that facilities for intercourse between those concerned with the management of the electricity departments should be fostered. In view of the fact that the expenses incurred by delegates to conferences of the Urban District Councils' Association is refunded, it is only right that similar treatment should be meted out to the representatives of the Municipal Electrical Association. The Urban District Council of St. Annes are approaching the various municipalities interested, and the Electric Lighting Committee of the Stepney Borough Council have signified their hearty approval.

Electric Railways in Japan.—The completion of the war and the subsidence of the excitement which attended its termination once again brings into prominence the social and domestic policy of the country, which during the period covered by the war was eclipsed by its imperial policy. Notwithstanding the fact that the minds of statesmen and of the populace have been absorbed in the operations of the military and naval forces, we find that the internal development of the country still continues. The American consul at Kobé (Mr. Sharp), in a report to his Government, announces that Japan is already adopting a system of electric tramways, and gives details of the new road recently opened between Kobé and Osaka. He says that the opening of the Hanshin Electric Railway between Kobé and Osaka marked a great advance in electric traction in Japan, it being the first line constructed to connect

Digitized by Google

two large cities. The railway is operated by the electric overhead trolley system, with 1,600 kw. power, and covers a little more than 19 miles. There are in use at present 18 cars, which were made by the Nippon Sharyo Seizo Kaisha, of Nagoya, Japan. The cars are well made, and have a seating capacity of about 50 each. The line is divided into four sections, the fare on each section being 1½d., these being subdivided into ¾d. journeys. All told there are 30 authorised stopping places between the termini, stops being made only when passengers wish to get on or off the cars. There has been much speculation as to whether the new competing service will not greatly affect the traffic between Kobé and Osaka, on the Imperial Government railway. Besides the difference of fare, which is 5d. on the tram and 8½d. third-class and 2s. first-class on the steam cars, the electric cars run every 12 minutes, against every hour on the steam railway, and have 30 stopping places, as against three. The average time, however, is about an hour and a half—about half as long again as the time occupied by the steam cars. On the whole, it is more than probable that the new line of cars will cause a very considerable diminution in the receipts of the Government railway between the two cities. The amount of paid-up capital in the company is £148,500.

Electrotherapeutics. — The measure of progress which has been made in the various applications of electricity for the prevention and cure of disease in America, can be pretty accurately gauged from the proceedings at the annual meeting of the American Electrotherapeutic Association held recently in New York. The reports of the various committees gave evidence that the association's work is well organised, whilst the papers read were of a high order of merit. On the matter of introducing electrical methods in the treatment of cancer, Dr. George Betton Massey asserted that as a result of analytic statistics relating to cancer a much larger proportion than is commonly supposed could be treated by this mode. For the early stages of cancer he recommended mercuric cataphoresis, and for cases difficult of access the X-rays. In his experience, since 1893 about 20 per cent. of cataphoretic operative cases had been improved by the treatment. Dr. Amédée Granger in his experience for cataphoresis on the mode adopted by Dr. Massey used currents varying from 200 to 700 milliamperes, the treatment lasting in some cases for 1 hour and 40 minutes. It was found that sudden changes in the strength of the current had a stimulating effect in the cases of feeble patients. Dr. Fred Harris considered "The Practical Uses of the Sinusoidal Current," and described an apparatus designed in 1893 by Dr. A. E. Kennelly which generated a high-frequency, high-potential current. This apparatus had 12 primary and 12 secondary rotating coils, and when driven at a speed of 4,800 revolutions a minute gave 1,900 alternations a second. The current was controllable both by regulating the speed of the motor and by putting resistances in the alternating circuit, and it gave much better results than other forms of electricity. From his experiences with radium in treating for diseases of the nose and throat, Dr. Freudenthal was able to relate two positive cures in the case of diseases of the larynx by the application of 10 milligrammes of radium put up in an aluminium tube. Among the other contributions were papers dealing with the preparation of "Radioactive Water," by Dr. W. J. Morton; "The Relative Action of the Röntgen Ray and Light upon the Enzymes, and their therapeutic significance," by Dr. E. C. Titus; and "Radiant Energy and Ionisation," by Dr. W. J. Herdman. An interesting variety of electrotherapeutic apparatus was also exhibited at the meeting.

Telephony.—The series of lectures arranged in connection with the Electrical Exhibition was brought to a close on Friday last, when Mr. L. Gill gave an interesting address on "Telephones" at the Olympia. There was a very large audience present, over which Mr. Preston presided. In a popular discourse, destined to make more generally known the workings of the present-day telephone and the methods by which rapid communication is obtained, the lecturer explained the evolution of the transmission of waves set up in speech, from the old toy telephone to the mechanical process which, for commercial purposes, is now worked electrically. The transmitter, a sensitive electrical valve, which when at rest is supplied with a steady current of electricity, but immediately any sound occurs in its vicinity the strength of the current is varied proportionally to the sound, both as regards the character of the sound and as regards loudness. For signalling or speaking, the connections are changed automatically by a switch which is generally made in the shape of a hook on which to hang the telephone. When the hook is up the transmitter and telephone are in circuit, when it is down the bell is in circuit, and with the bell is the condenser which allows the alternating ringing currents to pass, but will not allow the steady signalling current to pass. To describe the magnetic field which exists round the wire that conveys the current of electricity, a number of illustrations were shown upon the screen. The electromagnet is attached to the poles of a permanent magnet. The strength of the magnet is varied by the current in its coils, and the diaphragm, in order to reproduce speech, must very closely follow the rapid variations of the electrical current. In ordinary conversation, the movement of the diaphragm, too and fro, is about $\frac{1}{10}$mm. The current is in a series of waves, and not a steady current as for electric lighting. The current in the telephone circuits is not of the same strength in all parts of the circuit. A guttapercha-covered wire is economically quite impossible, except under very special conditions, mainly because it would require the wires to be separated by very thick walls of insulating material. Paper and dry air have been found to give good results, and telephone cables are now generally made in that way, a detailed description of which was given with illustrations. The telephone is not supplied from a main like the electric light, but is connected by a separate pair of wires with the exchange. The operations of the switchboard and connecting and disconnecting apparatus were also described in such a way as to make the audience familiar with the internal workings of the telephone exchange. The illustrations did much towards this end, whilst the quiet attention which attended the discourse and the hearty applause which marked its termination, manifested the keen interest taken in it by the large assembly.

London Traffic Commission.—In continuation of our observations on the report presented to the Traffic Commission by the Advisory Board of Engineers, made in last week's issue, we note the emphasis with which attention is directed to the loss of money and time which annually occurs in London from lack of travelling facilities, and notice is directed to the possibilities of facilitating travelling by the introduction of motor omnibuses. Figures are given to show that the speed of these vehicles compares favourably with that of tramcars, and is materially faster than that of omnibuses drawn by horses. If they should come into general use, the speed of the present omnibus service will be greatly improved. The Advisory Board consider that if the vehicles can be economically worked, they will have an important bearing upon the transport of passengers in London, and may affect the consideration of railway and tramway policy. The problem, so far as congestion is con-

Digitized by Google

cerned, is reduced to the question whether omnibuses or tramcars are the more convenient way of conveying traffic in a public street. The advantages of the tramcar over omnibuses drawn by horses is acknowledged, but the question of motor omnibuses *versus* electric tramcars is still open to controversy. The engineers state that the tentative working in London of motor omnibuses within the past 12 months distinctly indicates that a rate of speed can be maintained by them which compares not unfavourably with the speed of electric tramcars in similar thoroughfares. Speed, however, is not the only consideration; the rapid depreciation of the motor omnibus consequent upon the wear of tyres and the charges for renewals cannot but handicap it in its opposition to the electric tramway. The chairman of the London Omnibus Federation, Mr. J. C. Pound, expressed himself to the Royal Commission as hopeful and even confident as to the successful introduction of the motor omnibus in London, and of its being able to compete with the electric tramcar. The engineers are of the opinion that the time has not arrived for a definite judgment to be formed as to the practical and financial prospects of the motor omnibus in London, and of its true position in a system of rapid transit relatively to the electric tramcar. Whatever may be the result eventually arrived at, however, the engineers remain unshaken in the belief to which we directed attention last week—viz., that the recommendations made as to routes and widening of the streets must remain unaltered. Three of the fundamental deficiencies in London tramways are: insufficient mileage; the stopping of existing lines short of "points of destination"; and dead-end terminals, setting up congestion in the streets. To remedy these, it would be necessary to give effect to the Commissioners' suggestion for the construction of adequate extensions. It is recommended that junctions should be avoided, and the traffic resolved into two components so as to preserve through running in both directions, by carrying each line of each system all across the lines of the other system. On the same principle it is advocated that the tramways should pass the stations of the underground railways whenever possible, so as to afford greater freedom of interchange for those who wish to avail themselves of a faster mode of conveyance in travelling more than a short distance.

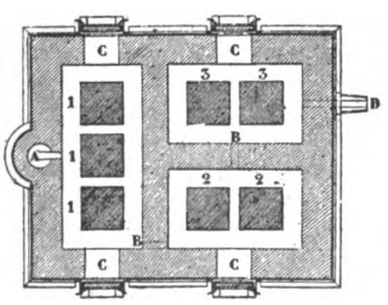
Sunday Cars.—The question whether or not cars should be run on Sunday is again to the fore in several centres, and is being hotly debated both in the council chambers and through the medium of the local Press. Most public authorities, recognising the claims of utility, have sanctioned the running of Sunday cars. That the same catholicity in treating this question is not universal, is evidenced by the reports which from time to time reach us from the various localities. The Town Council of Perth were recently called upon to decide whether or not the electric car service should be continued on Sundays. The principal considerations which impelled the objectors were the desire for the diminution of Sunday labour and the solicitation for the welfare of the tram workers, who, it was urged, were entitled to a rest on Sunday. Against this it was contended that the general convenience of the public should be studied first, and that the withdrawal of the cars from the streets on Sundays would inflict great hardship on those who have occasion to use them. To the majority of people the trams are the only means of transit, and to deprive them of this, without interfering in any way with the privileges enjoyed by those who are able to afford the luxury of private carriages, would be a grave injustice. For our part, we fail to see in a service of Sunday cars the violation of any moral principle or religious sentiment. There is no denying the purity of the motive which prompts the movers of the Sabbatarian movement, but at times the zealots among it are altogether incapable of appreciating their incongruities, or of perceiving the mischief likely to be wrought by their narrow-mindness. Even were their efforts successful, the amount of Sunday labour would not be diminished to any appreciable extent, nor is there any evidence that church-going will increase or that the religious sentiment become more profound. If a diminution of Sunday labour is desirable, it should be sought in directions where it is obviously unnecessary, and not where its effects would be detrimental to the interests of the public, for whose use and convenience the system is destined. This is a point which is constantly being overlooked by our puritannical administrators, who imagine that in virtue of their public office they are charged with the guardianship of public morals, which can only be advanced through a particular cult. The necessity of withdrawing the Sunday car service need not be resorted to in order that employés may be assured of a day of rest. Those who are employed in towns where the Sunday service is in vogue do not work a greater number of hours per week than those employed elsewhere, for by adequate staffing and judicious working arrangements this is obviated. The suggestion to decide this contentious question by taking a *plébiscite* is not one likely to prove efficacious if acted upon. The majority of electors cannot be roused from their state of apathetic indifference to exercise their franchise so that the issue of the vote shall be an adequate reflection of the opinion of the electors. But all who use the cars have not the privileges of citizenship, hence a representative decision could not be forthcoming. In this utilitarian age it is impossible to give way to sentiment, or to be guided by ideas which have long been outgrown. It would be better were our civic fathers to admit the hard facts of the day, and, instead of endeavouring to abrogate public privileges, to extend as far as is in their power, facilities for rest and relaxation in accordance with the popular idea.

Magnetic Properties of Iron.—The *Proceedings* of the Royal Society of Edinburgh contain a paper by Mr. James Russell, which gives some conclusions arrived at as a result of experiments conducted by him with one sample of transformer iron (in zero magnetic field), demagnetised by decreasing reversals of co-directional and transverse forces, and also by annealing. In previous communications there were established the magnetic aeolotropy of iron demagnetised by decreasing reversals of co-directional and transverse magnetising forces and of iron left transversely magnetised, whilst it was further shown that iron and nickel demagnetised by decreasing reversals of a directional force develop an induction component at right angles to the subsequent magnetising force, which tends to disappear as saturation values are reached, when the angle between these two forces is either 0deg. and 90deg. The experiments have determined the presence of the following properties in the sample of iron experimented upon: permeability, retentivity, coercive force, and energy loss due to hysteresis. In regard to permeability, annealed iron, owing to the gradually diminishing range of magnetic change, the permeability of the iron is decreased. In demagnetised iron, on the other hand, one-half the magnetic change of induction produced by the first, or the tenth, or the hundredth reversal is always greater than that produced by the first application of a given magnetising force. In other words, the permeability of the iron is increased. When the values are low, annealed iron is less permeable than iron demagnetised by a co-directional force, but more permeable than iron demagnetised by a transverse force. When the value of 1·8 C.G.S. units is exceeded, annealed iron is more permeable than iron demagnetised either by a

Digitized by Google

co-directional or by a transverse force. Reversals of the magnetising force modify the molecular condition of annealed and demagnetised iron, so that under like conditions annealed iron is more permeable for low values than transversely demagnetised iron. In regard to retentivity, measurements have also been made on the withdrawal of the magnetising force after its first application, and the results show that the curves of residual magnetisation so obtained accentuate the relative differences which exist in the induction curves under the co-directional, transverse, and annealing conditions of demagnetisation. From the hysteresis loops, the same result obtains when the residual demagnetisation is measured on the withdrawal of the magnetising force after it has been reversed 200 times. To ascertain the coercive force, the iron was carried through six sets of cycles between the positive and negative limits. It was found that the curves of each set of cycles cross the horizontal axis and each other at the same point, and that, consequently, the negative values are required to reduce the iron to zero magnetisation from equal positive values of induction, whether the iron has been demagnetised by a co-directional or a transverse force or by annealing. The coercive force of the iron, therefore, appears to be absolutely independent of the molecular condition impressed upon the iron by these three methods of demagnetisation. Regarding hysteresis loss, differences which exist between the three hysteresis loops for each set of cycles, having the same maximum values of induction, are more easily described as relative differences of shear. The areas of the three curves appear to remain the same so long as the maximum induction is the same. The conclusion is, therefore, arrived at that the energy dissipated as heat when the iron is subjected to cyclic alternation between positive and negative maxima is not affected by demagnetisation, by co-directional or transverse forces, or by annealing. The above summary of the more important results observable in the curves plotted for one sample of iron is only to be regarded as a preliminary communication, Mr. Russell preferring to defer the publication of curves until his experiments have been repeated for other samples of iron and for nickel.

Electric Steel Furnace.—At the annual meeting of the American Electro-Chemical Society, held recently at Bethlehem, consideration was given to the question of the electric manufacture of steel. Mr. Gustave Gin contributed a paper containing particulars of his new process. The construction of the furnace may be seen from the sketch shown below, which comprises essentially: a crucible, 1, for



fusion and refining by oxidation (corresponding to the pig end in the open-hearth practice); a compartment, 2, for the reduction of oxide of iron and recarburisation; a chamber, 3, for the colour test to get the proper carbon test. The electrodes of the compartment 1 are connected to one of the terminals from the source of electricity, and the electrodes of compartments 2 and 3 are both connected with the other terminal. The current passes from the electrodes to the metal through a layer of slag, which is the principal seat of the heating action of the current. The baths of metal communicate by openings, B, of sufficiently reduced section, in order that by reason of the Joule effect the metal may not remain solid. To put the furnace into operation, melted iron or liquid steel is introduced through the orifice, A. It distributes itself through the three compartments on the floors of which scrap iron is strewn, the pieces being placed in connection with B. Then arcs are created, and little by little the material is introduced. The oxidising slag of compartment 1 is composed of some mineral or slag rich in oxide of iron, in addition some lime if the metal to be refined is phosphatic. The slags of compartments 2 and 3 are neutral and little reducible by carbon. Aluminates of lime and magnesia, made from a mixture of bauxite, with limestone or dolomite, give favourable results. The addition of calcium fluoride makes it more fusible and mobile. By means of the method of circulation adopted, the refined metal in 1 passes next into compartment 2, where the reduction of the dissolved ferrous oxide and the recarburisation of the metal takes place. The author makes the point that the electrodes can be raised or lowered at will, and that this is important when the metal is tapped. The paper evoked considerable discussion, and it was doubted by various speakers whether the Gin furnace would be practicable. It has a large radiating surface. There would be some difficulty in keeping the contents of the three compartments separate. The design of the Gin furnace also seems to violate the metallurgical principle that one should not try to carry out essentially different processes in the same apparatus. Dr. Leonard Waldo then presented what was essentially a new paper, in which he pointed out that in electrothermic processes very heavy electric currents must be handled, which involves considerable difficulties. In all of the old electrometallurgy it had been necessary to deliver current through electrodes; in this case the management of the electrode becomes extremely difficult. At some time or other the current through the electrode either passes through a mixed charge with varying resistance or makes an imperfect contact. When that happens, the current arcs; and when it arcs there is the practically uncontrollable temperature of 3,850deg. C., and there results a corresponding impurity, a corresponding difficulty, and a corresponding intense action at the single point of the arc. This is the reason why a furnace without electrodes suggested itself. Dr. Waldo then sketched the principle of the induction furnace as the special case of a transformer with a single secondary winding (the molten bath). The containing crucible had no electrodes; no contact with fuel in any shape; the efficiency is high; the melting takes place at any rate desired. This control of the rate of heating is a most important advantage. The induction furnace permits adding quickly the energy units which make final minutes in the melt take the place of almost hours, when the high temperature is causing costly radiation and racking the mechanical stability of crucibles and furnace construction alike. At high temperatures approaching the melting point it is possible to push the rate of temperature increase to 1deg. C. per minute by adding 2 kw for every 100lb. of steel, or, to put it practically, the steel is raised the last 200deg. C. by adding 40 kw. for 10 minutes. If the furnace chamber is built of the proper material, its life is indefinite, since the heat is generated wholly within this chamber and not in excess of the fusion requirements. Dr. Waldo indicated the efficiency of the best induction furnaces by stating that they melt one ton of steel with an energy consumption of 500 kilowatt-hours. In this type of furnace the coal efficiency rises very much over the coal efficiency in the crucible process.

TELEPHONE EXTENSIONS IN GUERNSEY.

It is peculiarly interesting that at a time when the attitude of the Local Government Board towards the municipal telephone question is one similar to the "Passive Resister" movement, the earliest exponent of

MR. A. R. BENNETT, CONSULTING ENGINEER, STATES TELEPHONE DEPARTMENT, GUERNSEY.

municipal telephony, the States Telephone Department of Guernsey, should commemorate the installation of a new multiple switchboard, rendered necessary by the rapid extension of their system. In telephony seven years (and this is the time since when the first subscriber to the States telephones was connected) is a long time, or may be a very short period — a long time when the

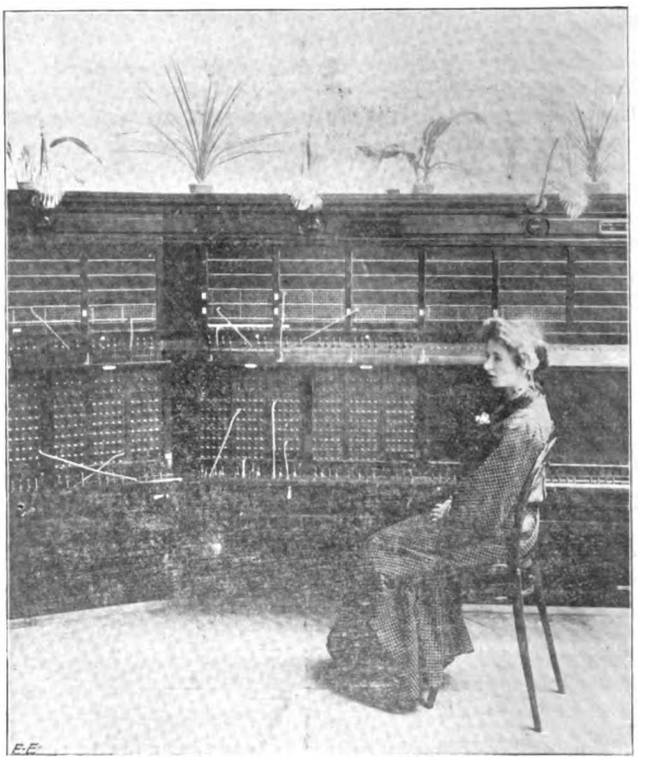
Central Telephone Office and Exchange, Guernsey.

improvements that have since taken place are considered; a short time when looking upon it from the point of view that it has taken the Government decades to realise that telephony should be treated on a more liberal scale than that accorded to it by its former sole monopolist, the National Telephone Company. The States of Guernsey, forming a state within the State, having its own Parliament, its own coinage, made up its mind, after the late Mr. Hanbury had disclosed the new telephone policy of the then Government, to have its own telephone system, and the attempt of the National Telephone Company to establish lines on the island in order to prevent the carrying out of this desire for independence was humorously and forcibly alluded to at the opening ceremony, which took place on the 3rd inst., in the presence of a large company. The

MR. ROBERT M'CLEAN, MANAGER, STATES TELEPHONE DEPARTMENT, GUERNSEY.

Bailiff and President of the States, Sir Henry Giffard, K.C., inaugurated the new multiple switchboard, Lady Giffard making the first through connection on the board.

The exchange building has been refloored and internally reconstructed with fireproof materials, chiefly steel and concrete. It now contains 13 rooms. On the ground floor are the manager's office, two clerks' rooms, mechanics' shop, inspectors' room, and test room, as well as public



Section of New Multiple Switchboard, Guernsey.

telephone office. On the first floor is located the switch-room, and on the first and second floors a six-roomed house for the caretaker has been provided. A battery room has also been erected outside the main building. The original switchboard provided in 1898 accommodated 300 lines only, with space for 200 more. This was rendered obsolete by the surprising success of the system. Thus the exchange private and sundry rentals in 1898 amounted to £115.

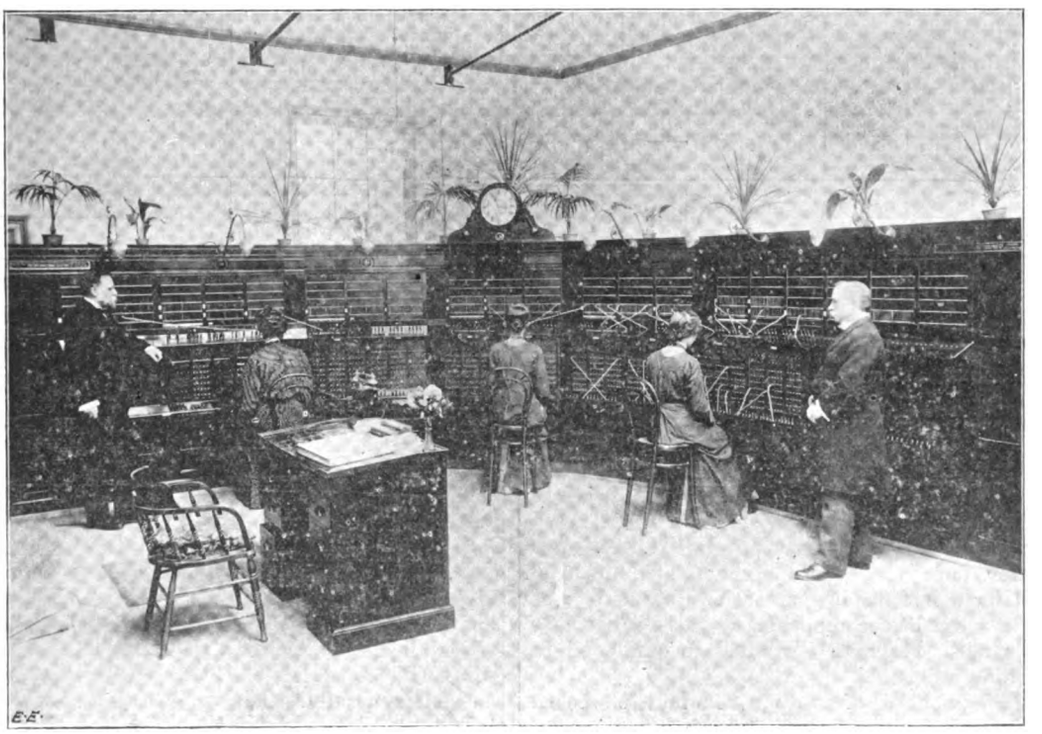
Digitized by Google

7s. 6d.; in 1904 they had grown to the respectable sum of £4,411. 19s. 6d. The number of subscribers in 1898 was 217; in 1904, 1,162. The public call telephones in 1898 were 9; in 1904, 49. The junction lines in 1898 were 7; in 1904 they had increased to 32; and on Sept. 28 last there were 1,430 stations working in the island, besides the 32 junction lines.

New Multipl Switchboard—States Central Exchange, Guernsey.

The building up of the new multiple switchboard has been carried out under the supervision of Mr. Robert McLean, the resident engineer and manager. It was designed by Mr. A. R. Bennett, M.I.E.E, the consulting engineer, and manufactured by the International Electric Company, of 55, Redcross-street, E.C., who have put in excellent workmanship. It has been finished complete for 900 lines, and has the multiple cables laid in for 200 more. The ultimate capacity of the board is, however, 3,100 lines, and it comprises special sections for public telephone offices and junction lines. Each operator attends to 100 subscribers, separate operators being provided for the junctions and public call lines, which number 50 each, so that there are 11 operators' working places at present provided. The original system of switching—Mr. Bennett's ring-through—is retained, the Telephone Committee considering that it is the best adapted to the island's requirements.

A special feature of the board is the indicator employed, which forms a departure from the well-trodden path of indicator construction. It is absolutely dustproof, inaccessible to the operator, and is automatically restored by the insertion of the answering plug. This indicator is of the revolving type, and consists of a pivoted black flag, which, when released by the attraction of the armature, is deflected by a spring and shows white. Five movements are united in one strip, which carries immediately underneath the corresponding number of jacks, so that mistakes in plugging the wrong number are almost impossible. In accordance



Another Photo of the New Multiple Switchboard, with less beauty and more board.

Digitized by Google

with modern telephone practice, a double-sided ring-off has been introduced, and the somewhat difficult question of replacing two separate movements simultaneously by one operation has been ingeniously solved by the manufacturers. The withdrawing of the calling plug replaces automatically both differently coloured ring-offs, and the operator is not allowed to sever a connection until both ring-offs have put in an appearance.

Another important point has been secured by making a conversation absolutely secret. The operator cannot, after having established the connection, cut herself in without disconnecting the two subscribers. The ring-offs are actuated by a common battery, and likewise the pilot lamps, one of which is common to every operator's position, the latter being provided with 12 pairs of plugs, each plug being separated by a translator. The centre of this translator is connected through the ring-off to battery. Each pair of cords is controlled by a three-position ringing and listening key, and transfer keys allow the joining of adjacent operators' positions in the less busy hours of the service. A calling-back key is also at the disposal of the operator in case that for one reason or another the calling subscriber should have left his instrument and requires to be called back, which can be accomplished by this key without changing any plugs. Magneto currents are employed to operate the calling indicators.

All the modern essentials of an up-to-date multiple board are embodied in this exchange, the cables being fireproof, while the carriers are arranged so as to allow easy access to each layer of multiple cable without interfering with the remainder. The jacks can be withdrawn either from the front or from the back, and the ringing and listening keys are mounted on hinged supports, allowing convenient inspection. Moreover, everything has been designed so that transition at any time to common battery calling and clearing will be easy by slightly altering the subscribers' instruments. At present the retention of the ring-through is considered of greater importance than automatic calling and clearing. The spring-jack wiring is parallel for speaking and series for signalling, in accordance with a plan commonly adopted by Mr. Bennett. It is also worthy of note that Mr. R. McLean, the manager, is the author of an improvement which has been introduced and which causes the free tails incidental to series wiring to be automatically balanced in the act of switching. The Guernsey telephone service has always given satisfaction to the subscribers. An improvement in celerity and certainty of switching may, however, be expected as soon as the operators become familiarised with the new apparatus. The total cost of the alterations described above has been £2,700.

At the opening ceremony, Lady Giffard put through the first connection by means of a silver switch plug bearing an appropriate inscription. The inauguration was followed by a luncheon given by the contractors at the Old Government House Hotel, Guernsey. Mr. Oppenheimer, the managing director of the International Electric Company, presided, and speeches were made by Sir Henry Giffard, General Maingay (chairman of the States Telephone Committee), Mr. A. R. Bennett, and others. Mr. Bennett emphasised the great services rendered to the Telephone Committee by their manager, Mr. Robert McLean, and also referred in complimentary terms to Mr. Kenneth Munro (the chief electrician), Miss Guille (the chief operator), and the staff generally. The opinion was expressed by Mr. Bennett that the Telephone Committee would have to be very guarded if ever it became necessary to hand over their system to the Post Office. The rates introduced by the States of Guernsey were by far the lowest in the kingdom, and in the hands of the States had produced, were producing, and were expected to continue to produce, a handsome surplus after making all necessary provision for interest, sinking fund, and depreciation. And they had been found sufficient to provide the best material and apparatus obtainable, and to furnish a service which was

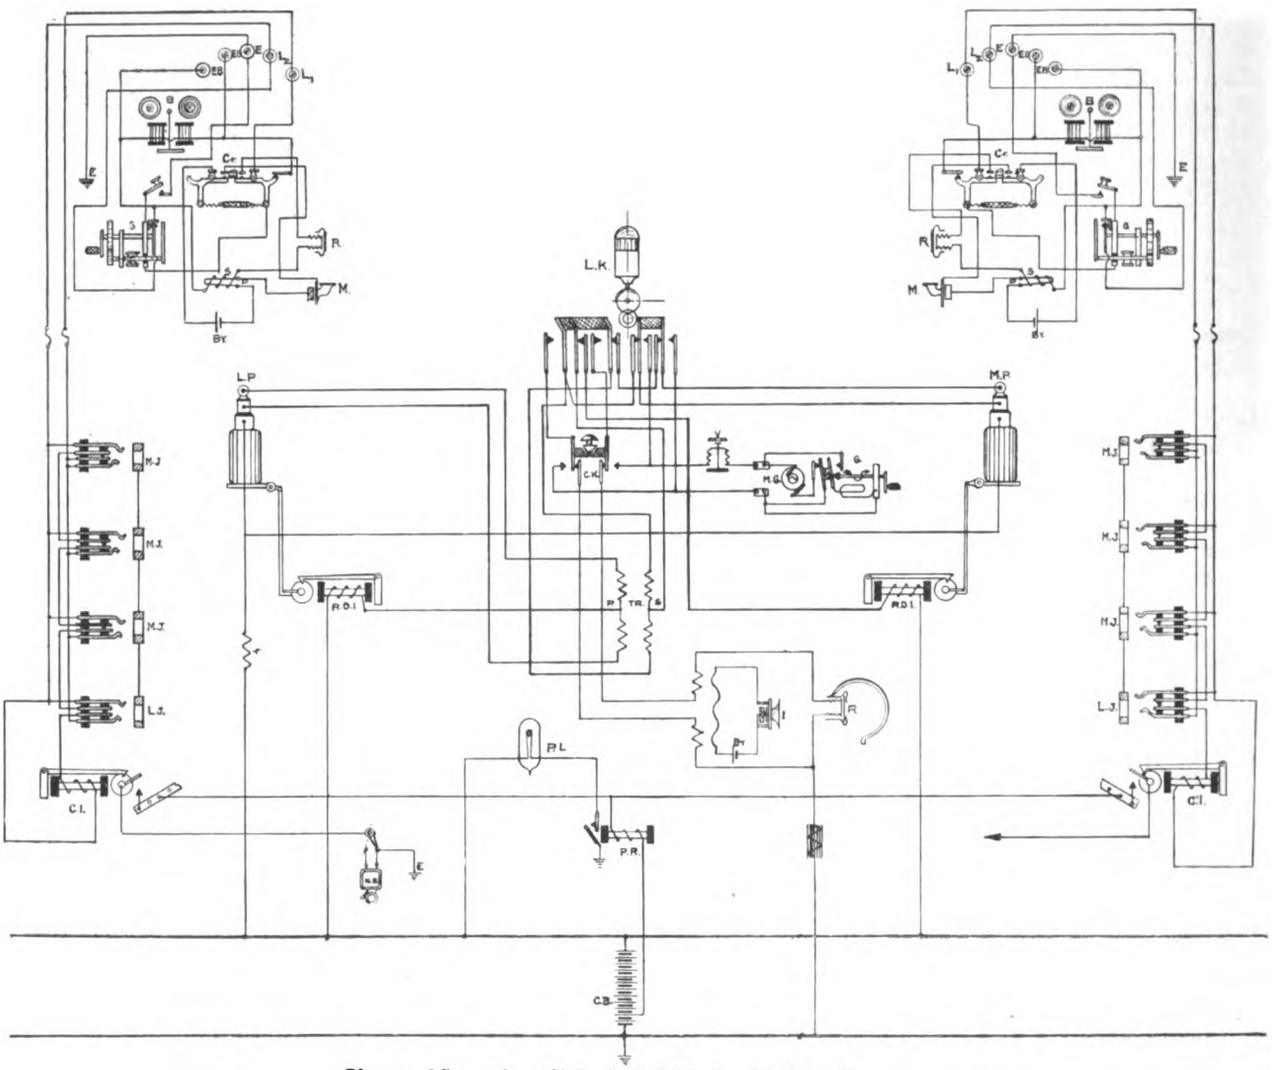


Diagram of Connec ions—States Central Telephone Exchange, Guernsey.

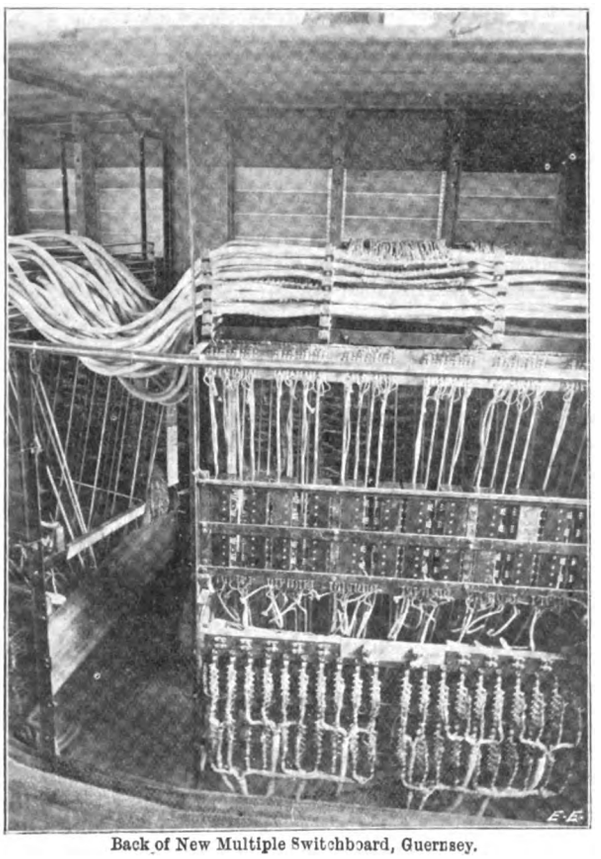
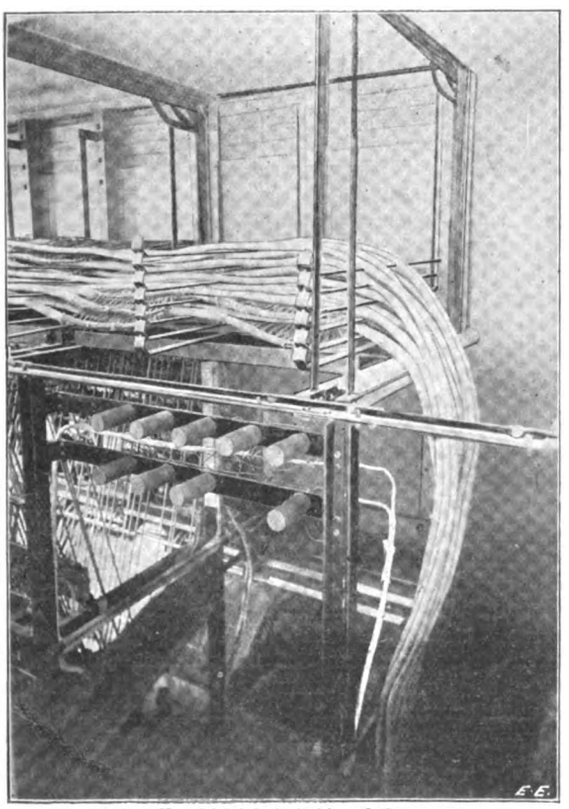
Digitized by Google

second to none in efficiency. The Post Office declared when the rates were first proposed that they could only result in a loss. Guernsey, Portsmouth, and other municipalities had



Back of New Multiple Switchboard, Guernsey.

demonstrated to the contrary, but the Post Office, if they acquired the system, would certainly not be able to produce equal results, nor would they probably wish to do so. The Post Office dreaded the extension of telephones, because



Back of New Multiple Switchboard, Guernsey.

they thought their telegraph revenue would suffer. They had, therefore, determined to get the telephones into their own hands in order that, if the telephone did ultimately kill the telegraph, the Post Office would have something to put in its stead. But the telephones would be useless to the Post Office unless they could be worked so as to produce a large profit. Hence the Post Office, at the late select committee, refused to pledge themselves as to future rates, and no doubt they intended, when the competing municipalities were out of the way, to work the telephones so as to produce a large profit regardless of the legitimate claims of the commercial community to be supplied at a commercial price. For this reason Guernsey must expect to have to fight a stern battle in order to preserve its rates.

General Mainguy expressed the opinion that if the rates in Guernsey were raised to the Post Office standard, the system would rapidly fall off and become a small one, instead of being, as it is at present, the largest telephone system in proportion to population in the United Kingdom. In Guernsey every subscriber, however low his rate, enjoyed the use of an exclusive line direct to the exchange; his conversation was private, and he had not to wait the convenience of several others on the same line when making a call. There was consequently nothing in common with the cheap rates advertised in England, which refer to party-line connections only.

THE DISTRIBUTION OF ELECTRICITY IN MINES.

BY B. C. H. J.

The use of electricity in mines is now becoming very general, and this article deals with one of the problems raised in connection with the practice—namely, the types of cable that should be used in the various situations, and the most satisfactory methods of installing same. It may be noted that the adverb of plurality is used, as these installations have to be designed on the same principle which lays down that "one man's meat is another man's poison." That is to say, the kind of cable that will suit one colliery will not be acceptable in another, and what is right for, say, the pitshaft is not always to be recommended for the underground roads of a mine.

This diversity of practice is accentuated by the differing systems of electrical distribution, such as continuous current and alternating three-phase current, which also embody the various tensions in use—commonly, from 100 to 3,000 volts. And, as different systems of mains are used in each mine for the different purposes—such as lighting, power, and signalling—so considerable variety of materials and methods may be required for use in connection with one and the same colliery distribution scheme. It will be seen that there is room for considerable diversity of practice, and this opportunity has been taken full advantage of by those responsible for the colliery electrical distributing systems now in use. This indulgence in the gratification of individual taste is now of service to a later generation (whatever its occasional disadvantage may have been to the persons primarily interested), inasmuch as it has shown up the capabilities of the systems used, and has thereby branded the inadvisable among them.

The type of cable used, in the early colliery installations, for all classes of work was vulcanised indiarubber; and to this day it is the best, particularly the rubber installation as then manufactured. But there are cheaper made cables now on the market, and, as the question of prime cost is an important one with many, such less expensive cables are more generally used for present-day work. These more modern cables are divided into two main classes: bitumen sheathed and lead sheathed, which classes are further divided as to insulation and protecting materials, as will be shown.

The plain bitumen cable mentioned is the class that has been very generally used for town lighting and tramways. In the best makes it consists of a solid sheath of specially-prepared bitumen applied under pressure to the copper conductor, and then lapped with strong tapes, being further protected with jute or other lapping as required. The suitability of this for use as a single-conductor cable is undoubted where there is no chance of undue heat being applied, either externally or through overloading the conductor. In cases where such overheating might tend to decentralise the conductor, or where multiple-conductor cables are required (if neither rubber-covered or metallic-sheathed mains are allowable), the conductor is first covered

Digitized by Google

with a layer of impregnated paper or fibre, and then sheathed with bitumen either completely around the paper on the single-conductor type of cable or over the outside circumference on the multiple-conductor type, the conductors themselves being insulated from one another by the paper covering. It will be seen that the paper makes a more solidly mechanical dividing medium between the copper strands working at different potentials than can be hoped for with such a plastic substance as bitumen. If, however, the bitumen is unduly stiffened in manufacture it tends to become brittle, so that bending it in cold weather may cause it to crack.

The use of the paper separator is further valued in colliery work by its ability to withstand the increased liability to overloading that is involved when, for instance, coal-cutters get jammed or when trucks run off the rails, thus increasing the current passing. The liability of these all-bitumen cables to decentralise is increased by the fact that such cables are usually hung upon cleats or other suspensions at intervals, and are liable to have their weight at such points of suspension increased by their use as occasional clothes lines and tool racks. Some insistence is made upon this point—namely, of the necessity for a mechanically strong insulating separator in such a type of cable, as the fact does not seem to be as well known as it should in mining circles.

The lead-sheathed type of cable is also served with paper immediately under the lead, as in the standard town-lighting type, but this also requires further modifying to suit the special circumstances of colliery work. In this instance it is the lead that is liable to be affected, either by the peculiarly deleterious pit water or by the exceptional conditions of wear and tear associated with colliery working. As a rule, therefore, lead-sheathed cables are used more as a base to work upon as regards protection, than as the completed article, in this class of electrical distribution. Rubber-covered cables are still used for the lighting and motor connections, but their general use as main cables is, as before mentioned, out of date.

It will be seen, therefore, that the following styles of cables are in use, and their respective advantages will be further discussed:

Vulcanised rubber insulated, braided over all.

Bitumen insulated, braided over all, or jute served, and possibly further protected by armouring

Paper or fibre insulated, bitumen sheathed, and protected as above.

Paper insulated, lead covered, and protected as above.

To take a concrete instance. A coal mine is to be worked by electricity—the lighting, the coal-cutting, the screening and washing machinery, the ventilating, the hoists, mechanics' shop—and, in fact, everything but the main winding gear is to be worked from the dynamo-house. (Mining men will appreciate that there is too imperceptible an advantage in such cage winding, other than by steam-engines, to make it worth while to use electric power for this most vital part of the machinery unless the pit shaft is some distance away from the power-house). This mine instanced is one providing household coal, which means that it is less likely to be dangerous, as regards firedamp, than a steam-coal mine. Its workings are fairly compact, so that there would be little power loss in the mains. It is, therefore, decided to use continuous current. The voltage is 500, the feeder cable down the shaft is to be ·5 square inch, and the distributors in the workings vary from ·25 to ·05 square inch. The question arises as to the best type of cable for the above requirements.

Taking the surface work first, the cables for the screens, the washery, the mechanics' shop, and the pithead lighting are usually cleated overhead, and are subject to rough usage, heavy vibration, and extreme weather conditions on their way from the dynamo-house to their current-consuming devices. The best possible class of cable should, therefore, be put in here, such as the rubber-insulated type, heavily braided and compounded, with a coat or two of varnish painted over when cleated in position. The cleats should be of wood, and should have the square bearing edges slightly chamfered off; they should not grip the cable too tightly. A piece of brattice cloth, or of hose pipe, placed around the cable at the point of support, will lessen the effects of vibratory friction common to such situations. If the dynamo-house is some distance away, such as would be the case where power is generated at one centre for several pits, the feeders would require to be laid either underground or erected on poles. If public property has to be traversed the underground system should be used, with either paper-insulated, lead-covered, or bitumen-insulated, jute-served cables. The method of laying these depends upon the possibility of further extensions later. If no extensions are likely, a solid pitched-in system is recommended, composed of stout creosoted wood or asphalt trough, the cables resting on asphalt bridges and filled in all around with tempered pitch or bitumen to a thickness of about ½in., finally being covered by hard tiles or asphalt concrete to avoid mechanical damage.

If, however, a probability exists of further or heavier cables being required, iron or stoneware pipes should be laid for drawing the cable in. The cables should be further protected by jute serving to prevent abrasion when being drawn into the pipes. Draw boxes should be built at maximum intervals of about 100 yards, on straight runs, for this purpose. The joints should be made by the cable-maker's own men, as they are more expert at this special class of work than ordinary electricians can hope to be. Further, supervision should be given to the whole of the work by a representative of the cablemaker, who in such a case would guarantee the work for a period of time (usually a year) from faults due to manufacture or laying. Incidentally it may be mentioned that there has been a growing tendency among users of cable to be satisfied with the supervision of their own officials, or at the best of a jointer or foreman from the cablemakers, and this comparatively unskilled or irresponsible superintendence has often led to much trouble upon the cable portion of the work at least.

If the whole of the route from the power-house to the pithead is private property, and it is any appreciable length, the conductors may very well be erected overhead on insulators fixed to poles. The poles should be of the stout telegraph type, the cross-arms of well-seasoned oak, and the insulators double-shed porcelain, with ample room underneath for cleaning between the sheds. The conductors need not be stranded with small wires, but may be built up of either No. 0, or 00, or 000, or 0000, whichever is the most convenient multiple of the sectional area of conductor required. Thus, for the ·5 square inch conductor mentioned, four No. 0000 of ·125 square inch each would make the exact size. If these are each erected and strained up separately, then lashed to the insulator with soft copper wire, a solid and simple arrangement will result. It should be noted that if the whole of the conductor is erected in one section, it is harder to get such a flat curve as by straining it up in detail.

The cable for the pitshaft is next to be decided on. There are many types of cables and different methods of fixing in general use, and each arrangement is considered by its erector as the best. As a rule, such arrangements *are* the best for their own particular job only. To summarise some of these in order of simplicity: The lightly-insulated cable with a single insulated suspension at pithead, as used at Ackton Hall Colliery by Mr. R. Holiday, is specially fitted for the local circumstance of a wide pit-shaft where ample spacing can be allowed. In narrower shafts the tendency would be for the conductor to swing into mutual contact, with disastrous effect where dampness occurred. The cables there are mostly triple braided, so that in a dry situation but little leakage or chance of damage to a person touching them should result. The chief advantage is that there are no intermediate supports upon which deteriorating influences may make a base for attacking the insulation of the cable; and, further, the cable is cheaply insulated. It is possible that the new regulations may discourage this arrangement (per Clause 5, Section III.).

The next system, in point of simplicity, consists of insulated and armoured cables, also suspended from the pithead only. This suspension is made from the galvanised iron wire armouring, of which there are two layers, to a steel hanger to which the armour is attached, and which

Digitized by Google

has eyes to hold the chain slings or other suspensory arrangements. The armouring, therefore, acts as a protection from damage, and also takes the strain off the pendulous cable.

The next most usual practice is to clip the cables up to the buntons by means of cleats, spaced at intervals of from 10 to 100 yards, depending on the size of the cable or the distance between the buntons already installed for supporting other items of mining transmission. The length of cleat would depend upon the length of span, but it varies from 2ft. in length in general practice. The cleats, however, cannot be made too long, and will be the safer for a packing between the cable and cleat, such as split rubber hose pipe. The methods of fixing the cleats are various and suited to the arrangement of the bunton, to which it is either clipped, or bolted to, or supported upon with intermediate girders. A stout roofing hood should be screwed on to the top of the cleat, to deflect falling material; and special attention should be paid to the protection of the cable at this point. For pits where the water is too bad for any protective metal to be exposed, a well-used practice is to run strong tarred wood casing down the side of pit, into which the cables can be made a tight fit by tapping with a mallet. This casing should further be lined with tarred felt, and the whole arrangement should be thickly coated with Stockholm tar before screwing the cover on, the cover being afterwards tarred over. If the tar is occasionally renewed, the arrangement should be a good lasting one for even the worst of pits. The exceptional conditions to be met with occasionally may be imagined when it is stated that a guttapercha-insulated cable embedded in a thick tarred wood trough has been utterly spoiled, as to insulation, by the action of the shaft water, which penetrated the treated wood and attacked the guttapercha. This casing method is apt to prove expensive if buntons are not closely spaced down the shaft, as additional supports for the casing will be required or a specially made continuous-jointed casing would have to be provided.

In some instances cables are run down iron barrel, which is screwed together in 9ft. lengths and supported at fairly long intervals up to 50 yards. The cable is then held in a long cleat at the top, which cleat is fastened to the pithead timbering; cable cleats being further used at the pipe-supporting buntons. These pipes and their erection are somewhat expensive, but they make a first-class job, especially with a rubber cable; the writer knows cases where the combination has been in satisfactory use for over a dozen years, and is, like Charley's Aunt, "still running."

(To be continued.)

THE TRANSMISSION OF POWER BY ALTERNATING CURRENTS.

BY ALFRED STILL, M.I.E.E., A.M.I.C.E.

(Continued from page 561.)

VECTOR DIAGRAM FOR THREE-PHASE TRANSMISSION, TAKING INTO ACCOUNT RESISTANCE, SELF-INDUCTION, AND CAPACITY.

The diagram Fig. 24 has been drawn to scale, and shows the relations between the E.M.F.'s at generating and receiving ends of an overhead three-phase transmission line for the condition of full load. The data upon which the calculations have been based are such as might apply to a practical scheme of power transmission, and the diagram has the advantage of showing the relative importance of the effects due to ohmic resistance, self-induction, and capacity.

Data.—Total power delivered at full load = 4,000 kw.
Power factor ($\cos\theta$) = ·8.
Pressure between wires at receiving end (E′) = 30,000 volts.
Frequency (n) = 25.
Length of line = 100 miles.
Diameter of copper conductors = ·4in.
Distance between centres of wires = 45in.

To calculate the current, C′, at receiving end, we have

$$\sqrt{3}\,E' \times C' \times \cos\theta = 4{,}000 \text{ kw.},$$

which gives us 96 amperes as the full-load current, C′, delivered at receiving end. We can, therefore, draw the E.M.F. triangle, $e'\,a'\,b'$, with equal sides, each of such a length as to represent 30,000 volts, and the vector O C′ 36° 52′ behind O e' (corresponding to the power factor of ·8), and of such a length as to represent the current of 96 amperes at receiving end.

Capacity Current.—On the assumption that the whole of the capacity is concentrated at receiving end, and that the E.M.F. wave is a sine curve, we can calculate the capacity current by means of the formula

$$C_k = 2\pi n K e' \times 10^{-6},$$

where K is the calculated capacity between any one wire and the neutral line (as previously explained), and e' is equal to $\frac{E'}{\sqrt{3}}$. The value of K, as given by the expression

$$K = \frac{\cdot 0388}{\log_{10}\frac{d}{r}} \times 100,$$

works out at 1·65 microfarads, which gives us for the capacity current

$$C_k = 4{\cdot}5 \text{ amperes.}$$

The vector O C_k in the diagram must, therefore, be drawn of such a length as to represent 4·5 amperes to the same scale as O C′, and in a direction at right angles to O e', as explained in connection with single-phase currents. The

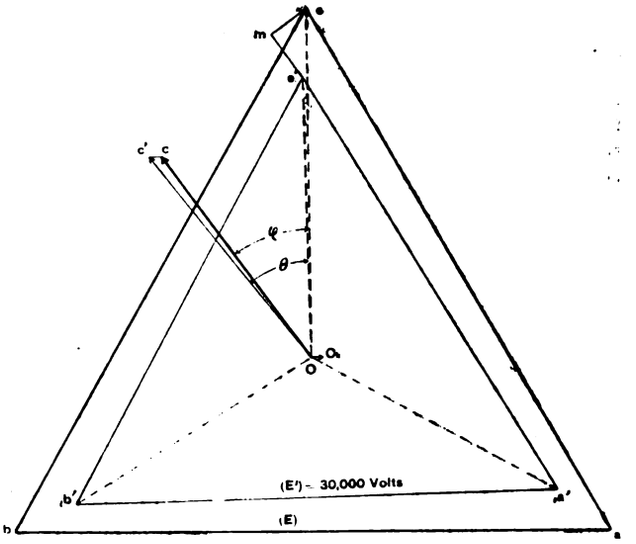


FIG. 24.

total current in the line is O C, obtained by compounding O C′ and O C_k. This vector, which scales 93 amperes, is, therefore, the current delivered to the line at the generating end.

Resistance Drop.—The resistance of a copper wire ·4in. diameter and 100 miles long will be about 35 ohms. This gives us for the drop in volts per conductor at full load C r = 3,250 volts.

Self-Induction.—On referring to the curve Fig. 4, it will be found that the coefficient of self-induction per mile of single conductor ·4in. diameter, with a distance of 45in. between wires, is 1·83 millihenrys, which gives us ·183 henry for the line 100 miles long. Hence the E.M.F. of self-induction per conductor (on the assumed condition of a sine curve current wave) is

$$2\pi n L C$$
$$= 2\pi \times 25 \times \cdot 183 \times 93$$
$$= 2{,}670 \text{ volts.}$$

We are now in a position to complete the diagram Fig. 24. Draw $e'\,m$ parallel to O C and of such a length as to represent the volts required to overcome the ohmic resistance of the conductor—*i.e.*, 3,250 volts. At the point m erect the perpendicular $m\,e$ to represent the impressed volts (2,670) necessary to balance the E.M.F. of self-induction, and join O e. The length of this line will evidently give us the value of $\frac{E}{\sqrt{3}}$, where E stands for the pressure between wires at the generating end. The sides of the large

Digitized by Google

triangle scale nearly 37,500 volts, and this is the necessary pressure at generating end. The power factor at generating end (cos ϕ) is, in this example, very nearly the same as at receiving end; it measures about ·81, whereas the power factor of the load was assumed to be ·8. The power put into the line is

$$\sqrt{3}\,E \times C \times \cos\phi$$
$$= \sqrt{3} \times 37{,}500 \times 93 \times \cdot 81$$
$$= 4{,}900 \text{ kw.}$$

And since only 4,000 kw. are delivered at the distant end, the efficiency of the line—on the assumption that the leakage losses over insulators and through the air are negligible—will be

$$\frac{4{,}000}{4{,}900} = 81{\cdot}6 \text{ per cent.}$$

It must not be forgotten that the data on which the calculations are based have been chosen merely for the purpose of illustration; but, at the same time, these figures are such as might apply to a practical scheme.

Most Economical Section of Transmission Lines.—In the examples previously worked out we have assumed certain $C^2 r$ losses in transmission which have enabled us to draw certain conclusions as regards pressure drop, phase displacement, etc. We shall now briefly consider the various points to be borne in mind when determining the most economical size of conductors for any given conditions of electric transmission.

In the first place, it should be clearly understood that the following considerations are entirely distinct from any questions as to *choice of system—i e*, as to whether the conductors are run overhead or underground, whether they are insulated or bare, and, if underground, whether laid on the drawing-in or solid system. The question we have to solve at present is simply this—given a certain system of transmission (whether single or polyphase), will it pay us better to put in large conductors at a high initial cost but having small $C^2 r$ losses, or small conductors at a lower initial cost but having large $C^2 r$ losses? There is evidently a particular size of conductor which will prove to be the most economical to use on any given transmission scheme; but the difficulties of correctly estimating the amount and duration of load are generally considerable, and we have to be satisfied with a more or less close approximation to the best results.

Again, it will sometimes be found that the section of conductor, as worked out in accordance with economical considerations, cannot be adopted in practice for either or all of the following reasons: (1) the current density may be so high as to raise the temperature beyond the safe limit; (2) the pressure drop on a long line may be greater than can conveniently be dealt with; (3) in the case of overhead wires, the section may be so small that the line would be mechanically weak; (4) in the case of extra high pressures the surface of the wire may be so small as to lead to considerable increase of leakage through the air. The corrections to be made in such cases are fairly obvious. The section of the conductor must be increased to the required amount without regard to the question of economy, or it may be found that aluminium conductors can be adopted with advantage. If the cables are insulated, and the economical current density is so high as to raise the temperature unduly, two or more cables would have to be laid side by side and connected in parallel, or the cross-section of the single cable would have to be increased, according to which method proved to be the cheapest.

Prof. George Forbes once stated* that he would like to see an accurate volume published on the correct use and development of Kelvin's law of economy. The writer has no such desire, neither can he appreciate the utility of a book of this kind. It would in all probability resolve itself into a compilation of more or less intricate formulæ, applicable to a number of imaginary cases which might or might not fit in with the conditions to be dealt with in practice.

The following graphical method of determining the most economical section of conductors, which was introduced some time ago by Mr. Edw. W. Cowan and the writer,* is applicable to any system or conditions of supply, and does not involve a knowledge of higher mathematics. As already stated, in calculating the most economical section of the conductors in a transmission line, there are two factors only to be considered: (1) the first cost of the conductors; (2) the cost of the energy lost in the line. Kelvin's law, in its simplicity (and, indeed, when the law of maximum economy departs from this simplicity it ceases to be Kelvin's law), may be stated as follows: "The most economical section of a feeder is that which makes the annual cost of the $C^2 r$ losses equal to the annual interest on the capital cost of the copper in the line, plus the necessary annual allowance for depreciation." The cross-section should, therefore, be determined solely by the current which the conductor has to carry, and not by the length of the line, or an arbitrary limit of the percentage full load drop in pressure; the drop, even if considerable, must take care of itself. If there are reasons which make a large drop undesirable, then, if necessary, economy must be sacrificed, and the line calculated on the basis of pressure drop only.

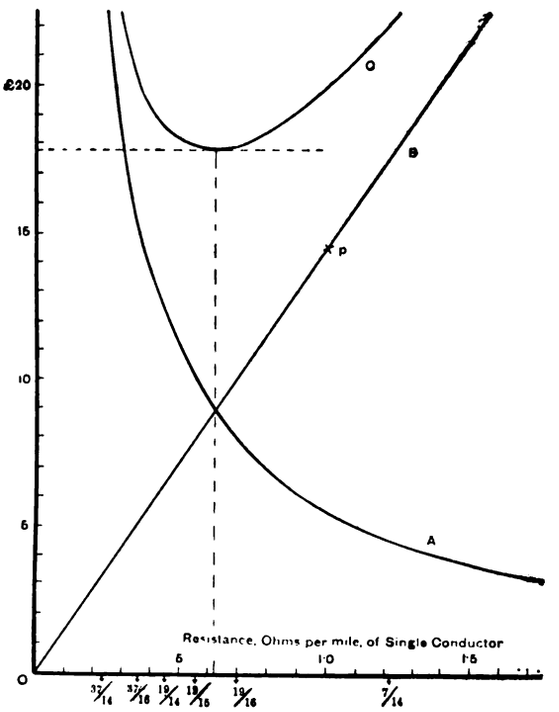

FIG. 25.

Kelvin's law is based on the assumption that bare conductors are used, and that the cost of these, erected in position, is directly proportional to the weight of the copper. This assumption is not justified in practice if insulated cables are used, the cost of which per pound of copper is greater for the small than for the larger sizes. But in the case of an overhead transmission line with bare conductors Kelvin's law may give sufficiently accurate results, because, although the cost of erecting the smaller wires may be greater *per pound* than for the larger sizes, the insulators, supports, etc, may become more costly as heavier wires are used, thus making that portion of the total cost of the line *which depends upon the section of the conductor* approximately proportional to the weight of same. To cover all cases in practice, the law of maximum economy may be stated as follows: *The annual cost of the energy wasted per mile of the transmission line, added to the annual allowance (per mile) for depreciation and interest on first cost, shall be a minimum*

It is not very easy to estimate with any degree of accuracy the probable amount of the $C^2 r$ losses during the year's working. The energy lost in a given conductor depends upon the square of the current and the time during which the current is flowing. If a cable conveys a

Digitized by Google

current, C, only 12 hours out of the 24 hours, then the energy wasted per day is only half what it would have been had the current been flowing continuously, and the watt-hours may be expressed as $12 \times C^2 \times r$, or as $24 \times \frac{C^2}{2} \times r$. It follows that, in working out the energy lost per annum in the conductor, we have to multiply the resistance, not by the maximum current which the conductor will at times be carrying, but by the mean value of the square of the current throughout the year. The expected average daily load curve should, therefore, be drawn, and the mean value of C^2 calculated therefrom. If the capacity current is considerable, this must be taken into account when calculating the average value of the square of the current. The diagram Fig. 25 will serve to explain how the proper size of conductor may be worked out in actual practice.

Let us suppose that 10 per cent. is to be allowed for depreciation and interest on cost of conductor; then, in the diagram Fig. 25, where the horizontal distances represent resistance per mile and the vertical distances represent money, plot the Curve A, which gives the relation between 10 per cent. of the capital spent on the conductor and its resistance in ohms per mile. Now calculate the cost of the $C^2 r$ losses per mile of cable for any particular value of the resistance, and draw the straight line, O B, through the origin, which will give us the cost for any other resistance of conductor. By adding the ordinates of the Curves A and B, the Curve C is obtained, of which the minimum value corresponds with the resistance per mile of the conductor which will be the most economical to use, whatever may be the length of the line or the pressure required at the receiving end.

Let us briefly consider how the two costs, of which the sum is to be a minimum, should be estimated. In the first place, the capital outlay on which the interest is calculated must include the insulation on cables (if any), and the difference in cost (if any) of the conduits or overhead construction *which is dependent upon the size of the conductors*. No capital charge which is *constant* for all sizes of conductors within practical limits need to be taken into account. This is a point on which there appears to be some difference of opinion. It has been most emphatically stated, on the one hand, that all standing charges, such as trenching, erection of poles, etc., must be included; and, on the other hand, it has been asserted with equal assurance that these constant charges must on no account enter into the calculations of line efficiency. The truth of the matter is that it makes not the slightest difference either one way or the other whether or not these standing charges are included. Here the advantage of the graphical solution of such problems becomes apparent, because even the non-mathematical reader will readily understand that the effect of adding the same length to all the ordinates of the curve A (Fig 25) will be to raise the curve C by the same amount *without altering either its shape or the position (in the horizontal direction)* of its point of minimum value. With regard to what is a reasonable interest to allow on the cost of the conductors for the purpose of drawing the curve A (Fig. 25) Prof. Forbes has pointed out* that if the copper in the lines be mortgaged, the interest we have to consider is merely that paid on the mortgage—say 4 per cent. If the copper is paid for out of capital, the interest may be much greater, being equal to the estimated dividends to be paid on the capital invested. In addition to this, there is the annual allowance to be made for depreciation, which will depend upon the probable life of the line and its scrap value when replaced.

We now come to the second of the two cost items—namely, the cost per annum of the energy wasted in the line. This will generally be the works cost of the power, and must include interest and depreciation on the plant in generating station, including step-up transformers, controlling gear, boosters, etc., through which the current passes before reaching the line. At the same time each scheme must be independently considered, as evidenced by the following statement borrowed from Prof. Forbes's paper previously referred to: "When using water power which is unlimited compared with the demand, the price per annum of the horse-power is the cost of generating the power. When the water power is limited and the demand unlimited, the price per annum of the horse-power is the selling price of the power." There is also a correction to be made in the event of the economical losses in the line bearing a large proportion to the total power transmitted. In this case the cost of power at the distant end of the line may be appreciably greater than at the generating end, and, under normal conditions, we ought to take the cost of the wasted power at something between these two values. If we determine the slope of the line O B in Fig. 25 on the basis of works cost at generating end, this will enable us to calculate the approximate resistance of the line and ascertain the approximate loss of power, together with increased cost per horse-power at the receiving end. We can then revise our previous figure for cost of power wasted in line and obtain a corrected value of the required resistance.

Example Illustrating Use of Diagram.—Consider an overhead line with bare copper conductors, to carry a maximum current of 60 amperes. Let us assume that probable load curves have been drawn, which will enable us to estimate the $\sqrt{\text{mean square}}$ value of the current throughout the year. This might be about one-third of the maximum value—let us say 20 amperes. If, therefore, we multiply the resistance of each conductor by the square of 20, we shall obtain the total power lost in the line on the assumption that this loss is going on day and night throughout the year. This gives us as the total number of Board of Trade units wasted in each conductor per annum *for an assumed resistance of one ohm*:

$$\text{Units} = \frac{1 \times (20)^2 \times 24 \times 365}{1{,}000}$$
$$= 3{,}500.$$

And if the cost of this power be taken at 1d. per unit, the cost would be

$$\frac{3{,}500}{12 \times 20} = £14{\cdot}6.$$

This enables us to plot the point p on the curve O B, and by joining $o\,p$ we can read off the cost of power per annum for any other resistance of conductor.

With regard to the curve A, we shall suppose that 10 per cent. is to be allowed for depreciation and interest on capital spent on conductors, and if we take the cost of these at 1s. 3d. per pound, we can readily plot a number of points through which this curve must be drawn. The curve C, as already explained, is the result of adding the ordinates of curves A and B. Its minimum value in our example corresponds to a resistance of ·62 ohm per mile, which gives us as the most economical conductor a stranded cable somewhere between $^{19}/_{16}$ and $^{19}/_{15}$, or the equivalent solid wire. (It should be noted that, since the curve A is a rectangular hyperbola, the minimum value of C is on the same ordinate as the point where the two curves cross—*i.e.*, where A is equal to B—but this is not necessarily the case when the conductors are provided with an insulating covering.) In order to carry the numerical example a little further, we shall assume that the transmission is on the three-phase system, 50 miles long, with 20,000 volts between wires. The drop in volts per conductor will be

$$C \times r = 60 \times {\cdot}62 \times 50$$
$$= 1{,}860 \text{ volts.}$$

And if we disregard the effects of self-induction and capacity, the loss of pressure between wires at the receiving end will be

$$1{,}860 \times \sqrt{3} = 3{,}220 \text{ volts.}$$

The initial pressure being 20,000 volts, the pressure at distant end is 16,780 volts.

The full-load power at generating end = 2,080 kw.
The full-load power at receiving end = 1,745 kw.
The power lost in the line = 335 kw.
And the efficiency of line = 84 per cent.

(To be continued.)

NOTES ON ALTERNATE-CURRENT INDUCTION MOTORS.*

BY T. HARDING CHURTON.

In this paper the author proposes, firstly, to compare the performance and characteristics of motors of the induction type when provided with short-circuit and with wound rotors respectively; secondly, to compare the performances of such motors on single-phase and polyphase circuits respectively; and thirdly, to indicate, by comparisons, the extent to which the working of such motors is affected by the frequency of alternations. For the purpose of illustrating the above comparisons, the performance of a particular size of machine with short-circuit and with wound rotor, for single-phase and for polyphase working, and on circuits of various periodicities, will be shown, the particulars given being the results obtained from actual tests on a number of machines of the same size. The windings were in each case appropriate, of course, to the circuit upon which the motor was to operate. It is not suggested that the comparative results here shown necessarily apply in all cases, but they may at least be taken as fairly representative.

When an induction motor is started up, the field of the stator starts at once to revolve at the full speed of the motor, and the rate at which it cuts the rotor conductors falls from a maximum when the rotor is at rest to a minimum when the highest speed of rotation is attained. The currents thereby induced in the rotor conductors lag behind the stator field, the difference in phase depending upon the strength of the currents, which will depend, of course, upon the resistance of the circuits. And the field due to the rotor currents, reacting upon the stator field, which it consequently weakens, is also, of course, dependent upon the resistance of the rotor circuits. But the torque exerted by the rotor being proportional to the strength of the stator field and rotor currents, and inversely proportional to the phase difference between them, the maximum torque of the motor at a particular speed depends, therefore, upon a certain value being given to the rotor resistance, which value decreases as the speed of the motor increases up to synchronism. For this reason, a motor provided with a rotor, into the circuits of which (either through slip-rings or other device) external resistance may be inserted and gradually cut out as the motor gains speed, starts up better than one having permanent connections. This may be expressed by the formula

$$R_0 = R_2 \times \frac{n_1}{n_1 - n_2},$$

where R_0 = total resistance of rotor circuits;
R_2 = ohmic resistance of rotor winding;
n_1 = frequency of stator currents (or speed of stator field);
n_2 = frequency of rotor currents (or slip of rotor).

In the case of two-phase or three-phase motors a considerable starting torque may be obtained with short-circuit rotors having conductors of comparatively high resistance. But such resistance seriously affects the efficiency, as well as the slip, of the motor when running on load, and motors so constructed are usually employed, therefore, only for intermittent work, such as, for example, operating cranes. When an induction motor is required to combine relatively high starting torque and high efficiency on load, it should have a wound rotor and variable starting resistance. If, however, so high a starting torque is not required, the short-circuit rotor, with low-resistance conductors, is preferred on account of mechanical superiority, greater electrical efficiency, and overload capacity. In a short-circuit rotor the currents and field are much more evenly distributed than in a wound rotor, and the former is consequently less liable to have "dead" points at starting. And though, owing to the more definite polar winding of the wound rotor, the average torque is greater than that of the short-circuit rotor, yet when the coils of the rotor are exactly opposite the coils of the stator, the torque is less than that of the short-circuit rotor. Again, with the wound rotor, the number of slots in the stator and rotor must have a common factor which conduces to a cogging effect.

But a further desideratum in the choice of the type of motor, particularly when of large size, is the maximum current that may be drawn from the mains at the moment of starting, and which will not interfere with the pressure regulation of the supply. As before mentioned, the field due to the rotor currents reacts upon the stator field, which it more or less wipes out, and thus, by reducing the self-induction of the stator coils, allows an increase of current to flow through them from the mains. Now, when a motor with an ordinary short-circuit rotor is started, the currents induced in the rotor are very great, and the current drawn from the mains must also, therefore, be considerable. If a polyphase motor of high efficiency with short-circuit rotor is switched directly on to the mains, with a periodicity of, say, 50 cycles, there will be a momentary rush of current equal to about three to five times full-load current, while the resulting starting torque will be about two and a half to four times full-load torque. If the pressure of the supply current is reduced by a transformer starter, the current from the mains may be reduced to, say, about full-load current, when the torque will be equal to about one-half to three-quarters full-load torque. With a wound rotor, a similar machine would give full-load torque with full-load current, and this current could be switched on gradually.

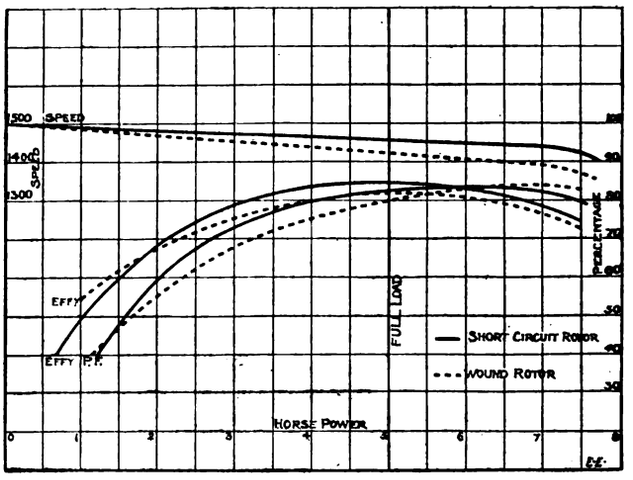

FIG 1.

The type of transformer usually employed for starting polyphase motors with short-circuit rotors is that known as the auto-transformer, which consists, for each phase, of a single coil wound upon an iron core forming a closed magnetic circuit. By tapping the coil at a point intermediate between the two ends, the voltage may be readily obtained that limits the current drawn from the mains to the permissible value, while allowing a considerably greater current to flow into the stator windings. With regard to the starters for motors with wound rotors, as the rotors are invariably provided with a three-phase winding the regulating resistance is always in three divisions. Liquid resistances are sometimes used, but more frequently wire or metal strip multiple-contact rheostats are employed. The curves shown in Fig. 1 are from tests taken upon two motors, one having a short-circuit rotor and the other a wound rotor, but which were in other respects identical machines. It will be noticed that both the efficiency and power factor are higher in the case of the machine with the short-circuit rotor. Both machines were constructed to give 5 b.h.p. at about 1,420 revolutions on single-phase, 200-volt, 50-cycle circuit. The starting torque obtained with the short-circuit rotor machine was ·45 full-load torque with 1·25 times full-load current, while the wound rotor machine gave ·75 full-load torque with full-load current. The slip is somewhat greater with the wound rotor, which would, moreover, pull out of step rather sooner than the short-circuit rotor. The difference between the results obtained with the short-circuit and wound rotors on polyphase working is practically the same as that on

* Paper read before the Leeds Local Section of the Institution of Electrical Engineers.

Digitized by Google

single-phase, though with the polyphase system the results themselves are much better, as will be shown later.

Speed regulation has been so far, perhaps, the least satisfactory feature of the induction motor. The usual methods adopted are: firstly, the insertion of non-inductive resistance in the rotor circuits; secondly, alteration of the number of poles of the stator, and, in the case of wound rotors, those of the rotor also; and thirdly, varying the voltage on the stator either by the insertion of resistance in the mains, or by transformer. With regard to the first of these methods, the one mostly in use, though possessing the advantage of simplicity, has the disadvantage of being uneconomical, being analogous, in fact, to the insertion of resistance in circuit with the armature of a direct-current shunt-wound motor. A further objection—one which also applies in the direct-current example—is the instability of the speed with varying load. If any considerable reduction in speed is attempted in this manner, it may become so susceptible to variations in the load as to render certain operations difficult or impossible. For many purposes, however, this method answers sufficiently well, and where the work is of an intermittent character the question of economy is not, of course, of much consequence. The second method, that of altering the number of poles, is not only complicated, involving many connections, particularly in the case of the wound rotor machine, and low efficiency and power factor, but is open to the further objections that the number of steps thus practicable is

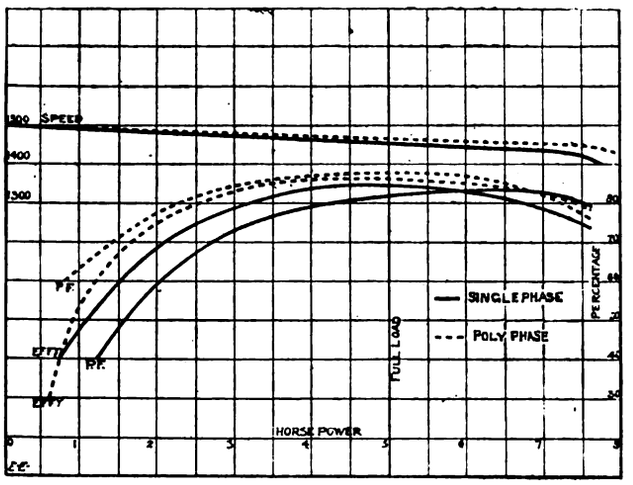

FIG. 2.

very limited, and that the system is too costly for general use. The third method, that of reducing the voltage on the stator windings, is the most wasteful of energy and the least effective. For the purpose of speed regulation, then, the wound rotor motor is the more satisfactory, though for some purposes, such as operating cranes, the short-circuit rotor with conductors of relatively high resistance, combined with graduated transformers for varying the voltage on the stator windings, is sometimes preferred for polyphase motors.

To compare, now, the performance of the motor on single-phase and on polyphase working, it must be remembered that the field produced in the single-phase motor is not a uniformly rotating field as it is in the case of a polyphase motor. When the rotor is at rest, a simple alternating current in the stator winding would produce only an oscillating field which would not cause the rotor to move at all. To start up the motor, therefore, a second winding is placed at 90deg. to the main winding, and by causing the current to lag in one winding and giving a lead to the current in the other winding, a phase difference is produced which creates a rotating field. But whereas the currents in a regular two-phase stator differ in phase by 90deg., those in the single-phase motor cannot be made to differ by anything like so much, and the resulting field is, in consequence, very irregular. As the rotor gains speed the field due to the combined action of the stator and rotor currents becomes more uniformly rotating, but never attains to the uniformity of the field produced by polyphase currents. For the above reason, motors of this type have not nearly so good a starting torque on single-phase as on polyphase circuits. And, for the same reason, the maximum running torque and brake horse-power of the motor is less when working single-phase than polyphase, and the single-phase motor will, moreover, pull out of step and stop with less overload than the polyphase motor will carry. Table I. shows the performance of the motor with regard to starting torque and current on single and two phase circuits of 50 cycles, 200 volts, and with short-circuit and wound rotors respectively. The superiority of the polyphase motor in this respect is clearly shown.

TABLE I.

	Single-phase.		Polyphase.	
	Starting current.	Starting torque.	Starting current.	Starting torque.
Short-circuit rotor	1·25	·45	1·25	·75
Wound rotor	1	·75	1	1

Note.—The figures refer to the normal full-load values.

The curves in Fig. 2 show also that the efficiency and power factor are higher in the case of the polyphase motor and that the slip is greater in the single-phase motor. The lower efficiency of the single-phase motor is accounted for by the greater iron losses due to the irregular flux and to the torque being lower on account of the irregularity of the field. And the power factor is also lower because the greater slip of the rotor retards the rotor field, which consequently becomes more out of phase with and thus opposes the stator field. The leakage coefficient and self-induction of the stator winding are thus increased and the power factor is, therefore, reduced. A great deal of attention has been paid to the methods of starting the single-phase motor, the principal object being generally to obtain as great a phase difference as possible between the currents in the main and starting coils. Condensers, which were formerly extensively used in this connection, have been abandoned on account of the trouble they gave through heating, varying in capacity with varying temperature, and by breaking down. Choking coils were also much more used than at present, the required self-induction now being usually obtained by suitably winding the auxiliary coils. The method of starting adopted by the author is to connect the main and starting coils in series and a non-inductive resistance across the starting coils—that is, in series with the main winding to which it gives a lead—while the self-induction of the starting coil gives the current flowing in it a considerable lag. The auxiliary winding occupies about one quarter of the stator winding space, and is wound in the centre of the main poles, where the main winding could not be usefully employed. It is usually wound with either one-half or twice the number of turns of the main winding. The author prefers the fewer number of turns on account of the otherwise high induced voltage continually on the windings tending to break down the insulation. In some makes of motors this risk of failure of insulation is still further increased by one end of the auxiliary coil being left connected to one end of the main winding, in which case the voltages of the two windings are in series. Thus, in a 200-volt motor the voltage on the windings may be about 550 volts, depending upon the phase difference of the voltage in the windings.

There are several means by which the starting torque of the single-phase motor may be somewhat improved, but which involve lower efficiency on load. And, as in most other problems in engineering, the question as to how far the running efficiency shall be sacrificed to improved starting performance is a matter of compromise. The results actually obtained, depend, of course, upon the details of design, particularly with regard to the flux densities, shape of the stator and rotor teeth, and length of air-gap, as well as upon the materials employed, particularly the quality of the iron in the stator. While the single-phase motor cannot upon equal terms compete with the polyphase motor, it is, nevertheless, in its better forms, an excellent machine.

The question of frequency is a very important matter with regard to induction motors. In the first place, the torque exerted by the motor is inversely proportional to

Digitized by Google

the frequency of the supply current, and a given size of motor will, therefore, be capable of giving twice the horse-power on, say, 50 cycles that it can give at the same speed on 100 cycles. In order, therefore, that the motor may give the same maximum horse-power on 100 cycles as on 50 cycles, the speed must be doubled. The loss due to hysteresis is directly proportional to the frequency. If, therefore, the frequency is greatly increased, the induction—and therefore the torque—must be much reduced to prevent heating of the iron and noise. But the magnetisation curve not being straight, the watts spent in magnetising are not diminished in the same ratio as the induction is reduced. Thus the iron loss is greater at the higher frequency, and, other things being equal, the efficiency of the motor is, therefore, lower. And the leakage coefficient being greater at the higher frequency, the power factor is, therefore, lower. This again, by increasing the currents, increases the $C^2 R$ losses, which, therefore, further reduced the efficiency. The hysteresis loss and leakage coefficient increase much more rapidly on the higher range of frequencies than on the lower. For example, the difference is much greater between 50 cycles and 100 cycles than between 25 and 50 cycles.

The curves in Fig. 3 show the difference in the efficiency, power factor, and slip of the same size of motor as before referred to when giving 5 b.h.p. on 50 cycles at about 1,430 r.p.m., and the same horse-power on 100 cycles at 1,880 r.p.m. It will be here observed that the speed on

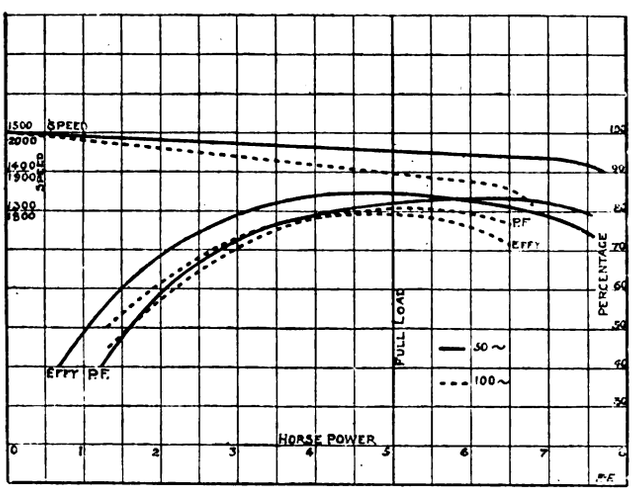

FIG. 3.

100 cycles is not, for the same horse-power, double that on 50 cycles, as would have been expected from the statement above. But it may be explained that this was due merely to the exigencies of manufacture, the same standard stampings having been utilised in each case and the windings varied to obtain the required output with the best results. While this arrangement occasionally necessitates the use of a machine somewhat larger than actually required, economies in manufacture are effected which repay the extra cost of material involved. When it is remembered that there are in the United Kingdom alone over 100 alternating supply systems, of which about 86 are single-phase, working at no less than 17 different frequencies, besides two-phase and three-phase, each with their own variety of frequencies, it will be understood that a manufacturer could not profitably make so great a variety of special patterns as would be required to obtain the greatest possible effect from a given size and weight of machine in every case. High frequency is not only prejudicial to efficiency, power factor, and torque, but is particularly detrimental to good starting performance.

TABLE II.—Starting Torque and Current on 50 Cycles and 100 Cycles of 5-h.p. Motor (Short-Circuit Rotor)—200 Volts.

Cycles.	Starting current.	Starting current.	R.P.M.
50	1·25	·45	1,430
100	2	·43	1,880

This will be seen from Table II., which gives the starting torque and current of the 5-h.p. motor on 50 cycles and 100 cycles respectively. It may be remarked that on circuits of 100 cycles about twice the full-load current is usually taken for starting short-circuited rotor motors, whereas on 50 cycles the starting current does not usually much exceed the normal full-load current.

High periodicity, then, to the motor user implies (1) higher cost of motors and (2) higher cost of working, and to the electricity supply undertaking it means (*a*) lower day load (because of the less inducements to power users to adopt the supply) and (*b*) greater proportional loss on mains, etc., on account of lower power factor of motors. Most of the systems having frequencies above 50 or 60 cycles were established before induction motors were practically thought of. Some of these are, happily, being gradually changed over to 50 or 60 cycles, and it would be well if a frequency of 50 cycles were adopted whenever possible. Standardisation in such matters greatly promotes economy and excellence in manufacture, promptitude of delivery, and is, from every point of view, a consummation devoutly to be wished.

In concluding these notes, a brief reference to the single-phase repulsion motor may not be out of place. If a copper ring is suspended in an alternating field, it tends to turn so that its plane is parallel to the direction of the flux, in which position it does not enclose any magnetic lines. If placed with its plane at right angles to the flux, it will not move, the tendency to turn in one direction being balanced by an equal tendency to turn in the other. Midway between these two positions—that is, at 45deg. to the flux—the tendency to turn would be at its maximum, provided that the currents induced in the ring were in phase with the primary field. Owing, however, to the self-induction of the ring causing the currents induced in it to lag, the position of the ring that gives maximum torque is moved correspondingly forward. If, therefore, an ordinary direct-current armature is placed in an alternating-current field and the brushes given a slight lead in either direction, and short-circuited, the armature (or rotor) will rotate. The function of the brushes is merely to short-circuit the coils as they successively come under the poles, and only those coils that are thus short-circuited are exerting a torque. The object of connecting the brushes together is—if the armature has a parallel winding—to equalise any irregularity of pressure, just as equalising rings are sometimes employed in multipolar direct-current armatures. If the armature is series-wound, the connecting ring is required to short-circuit the coils. The speed characteristic of such a motor is similar to that of a series-wound direct-current motor—it will race if run without load and the torque exerted varies inversely as the speed—and is, therefore, greatest at starting. If the armature windings are suitably connected to three slip-rings to enable resistance to be inserted at starting, and which can be gradually cut out as the motor gains speed, the starting will be improved and the starting current reduced. The effect of connecting the rotor windings in this way is that currents flow in all the conductors, thereby exerting a torque just as in an induction motor. And as the speed of the rotor increases up to synchronism the currents in the rotor come more into phase with those in the stator, and thus the torque due to this inductive effect increases with the speed. We have thus a compound effect, which results in a gradual decrease of torque from that due to the initial repulsion effect to the maximum running torque of the machine as an induction motor. For operating hoisting machinery, and many other purposes, such a motor is very well adapted.

On a 50-cycle circuit the starting torque may be as great as twice the full-load torque with less than 1·5 times full-load current, while three times full-load torque may be obtained at starting with about twice the full-load running current. And if when the motor has run up to speed the slip-rings are short-circuited, the motor will run practically as an ordinary induction motor. If the brushes are left on the commutator they continue, of course, to short-circuit the coils, which, therefore, continue to exert a torque due to the repulsion effect and tend to race. On the other hand, the induction action of the remaining conductors tends to run the motor at synchronism. The result is that, when

Digitized by Google

running light, the speed of the motor is a little above synchronism.

The efficiency and power factor of the repulsion motor are not quite so high as those of the induction motor, the current taken for the same horse-power and on the same voltage and periodicity being about 10 per cent. higher; and the horse-power of the motor is roughly 70 per cent. of that which it would be as a single-phase induction machine. Reversing the direction of rotation may be effected either by shifting the brushes to the other side of the neutral position on the commutator, or by shifting the position of the poles themselves. The latter may be accomplished by employing two sets of windings on the stator inclined to one another at the same angle through which the brushes would otherwise have to be moved. Either winding can, of course, be brought into operation by a simple two-way switch. The stator winding is switched directly on to the mains, and the starting current may be kept within the limits usually required by means of the regulating resistance in the rotor circuits. As is well known, when a circuit carrying a current is suddenly opened, the current tends to jump across the break in the form of a spark. And the tendency to spark as the short-circuited coils leave the brushes will, therefore, be understood. This has been, in fact, a serious difficulty with the repulsion motor. However, if the reactance voltage is kept sufficiently low, and the machine provided with slip-rings—so that the circuits are not really broken—the difficulty of sparking may be quite overcome. The prevention of sparking may, indeed, become more difficult in machines of large size, but with regard to that the author has not sufficient data to give particulars.

ROLLER BEARINGS.

BY T. W. HOW, C.E.

Under the auspices of the Tramways and Light Railways Association an interesting paper was read at the Society of Arts' rooms by Mr. Thomas W. How, C.E., F.R.G.S., on "Roller Bearings," with special reference to their application to tramway and railway rolling-stock. The chair was taken by Mr. A. L. C. Fell, M.I.E.E., chief officer, London County Council tramways.

The author claimed that as a result of very many years' persistent effort, practical experience, and exhaustive tests, it was now possible to give reliable data, based upon trials made under varying conditions and by independent authorities, extending over a series of years, on the advantages of roller bearings. After dealing in detail with the technical requirements of a satisfactory roller bearing for heavy and light loads, in which he showed that efficiency largely depends upon true parallelism, proper spacing of rollers and proportionate diameter, length and hardness of rollers, he gave examples of various contrivances for spacing the rollers, regarding the "Empire" floating cage as the most satisfactory owing to its simplicity and easy adjustment. He advocated the employment of solid rollers of special quality steel rather than of spiral or hollow ones, or rollers threaded on spindles. The want of success of earlier experiments made with roller bearings was due to excessive rigidity and improper load adjustment. These are now obviated by means of swivel seatings, so that the alignment of the load is evenly distributed. The author combatted the statement that roller bearings are not suitable for railroad or other rolling-stock because of earlier failures, and he referred to the brilliant successes in applied mechanics which have been the outcome of earlier experiments attended by many failures.

Having given some interesting and conclusive examples of the successful application of roller bearings to shafting and heavy coal-weighing shoots, the author turned his attention to the application of roller bearings to tramway and railway vehicles, and claimed that the starting effort in these vehicles has been proved to be 3lb. per ton of load, with its consequent reduction in coal consumption, electrical energy, and other motive power. After quoting the results of tests made several years ago at Birmingham and Southport, where the economy in current consumption was shown to be from 30 to 40 per cent., the author cited more recent tests made on the Wolverhampton and Croydon tramways respectively, where in the former case a proved economy in current consumption of 15 per cent. was obtained, and in the latter a similar economy was also shown equal to a saving in current of £37. 14s. per car per annum. Examples of railway tests were also given, the most recent being that on the London, Brighton, and South Coast Railway—a complete train fitted throughout with roller bearings which was put into regular service in November last. Notwithstanding that about two-thirds of the total coal consumption of the whole train was required for the engine alone, the test figures show that an economy of 15 per cent. in coal consumption was obtained on the drawbar pull. Taking only 10 per cent., however, as an average economy, this equals a saving of 100 tons of coal per train per annum, and, adding the savings in oil, etc., an economy of £100 per train per annum is shown over the cost of running with ordinary axle boxes. The results of exhaustive tests on the Indian State railways were given, which showed an economy in coal consumption of from 9 to 12 per cent. Taking 10 per cent. as the mean with coal at 10s. a ton, the economy is equivalent to £67. 10s. per train of six coaches per annum. Other favourable examples were given, and the author contended that extended experience had now amply proved that the efficiency and durability of roller bearings constructed upon proper principles are fully assured, whether they be applied to railway or tramway rolling-stock or to other fixed or movable machinery, and that their adoption is a necessity in all cases where cheap power is required, or where existing power stations or rotary machinery are working up to their full limit and have not room for expansion.

The lecture was illustrated by lantern slides, and a number of sample parts were also shown.

FORTHCOMING EVENTS.

FRIDAY, OCT. 27.

Physical Society.—At 5 p.m., "The Theory of Phasemeters," by Dr. W. E. Sumpner; "Apparatus designed for Measuring the Coronal Radiation during an Eclipse," by Prof. H. L. Callendar, F.R.S.

Institution of Electrical Engineers (Glasgow Section).—Fourth annual dinner at the Grosvenor Hotel, Glasgow.

Junior Institution of Engineers.—At 8 p.m. (at the Westminster Palace Hotel), annual general meeting and first meeting of the Incorporated Institution.

TUESDAY, OCT. 31.

Faraday Society.—At 8 p.m., "Alternate-Current Electrolysis," by Prof. Ernest Wilson; "Alternate-Current Electrolysis as shown by Oscillograph Records," by Mr. W. R. Cooper; "Notes on the Crystalline Structure of Electro-Deposited Copper," by Prof. A. K. Huntington; "Some Observations Respecting the Relation of Stability to Electro-Chemical Efficiency in Hypochlorine Production," by W. Pollard Digby, A.M.I.E.E.

THURSDAY, NOV. 2.

Rontgen Society.—At 8.15 p.m., "Ruhmkorff Coil," by Prof. Wertheim Salomonson (of Amsterdam).

Civil and Mechanical Engineers' Society.—At Caxton Hall, "Sea Defences," by Baron H. T. H. Siccama, M.I.C.E.

FRIDAY, NOV. 3.

Junior Institution of Engineers.—At 8 p.m. (at the Westminster Palace Hotel), presidential address by Mr. Dugald Clerk, M.I.C.E., on "The Problem of the Gas-Turbine."

SATURDAY, NOV. 4.

Birmingham Electric Club.—At 7.30 p.m., "Electric Furnaces," by Mr. J. H. Stansbie.

Institution of Civil Engineers.—Nov. 7, at 8 p.m., inaugural address by Sir Alexander Binnie and presentation of awards.

Institution of Electrical Engineers.—Nov. 9, at 8 p.m., the president (Mr. J. Gavey, C.B.) will deliver his inaugural address.

Lytham.—A company is about to be formed to take over the electric lighting provisional order, and the contractors will be Messrs. Foote and Milne, Limited, of Westminster. The installation will be on the three-wire system, and the consulting engineer (Mr. G. E. Fletcher) estimates the cost at £13,500.

GOVERNMENT CONTRACTS.

Every year a return is made of money spent by the Government in contracts abroad, and every year we have to read and hear diatribes against such transactions. So far as the electrical industry—or, indeed, any other industry for the matter of that—is concerned, the one expenditure that is a blot upon the sheet is an item of £220,054 for telephonic apparatus. The Government expenditure for telephonic apparatus is but a small part of the yearly expenditure for telephonic apparatus in this country, and we fear that could a strict examination of the facts be made it would be found that the bulk of our telephonic apparatus comes from abroad. We are well aware that half a dozen reasons have been advanced for this state of things, but, while the reasons are interesting, they are of little real value unless a practical remedy is found. One manufacturer lays great stress upon our fiscal system as a cause, and urges a change as a remedy. Probably there is much truth in his arguments, yet certainly they do not completely solve the problem. Now, there is no absurdity in approving as well as condemning the same individual, for just as few people are always in the right, so it is most improbable they should always be in the wrong. Hence we may safely commend the Government or other authorities for purchasing the best, while condemning them for putting obstacles in the way of cheap and efficient production. The one important point to consider is the statement that the foreign-made apparatus is better than is obtainable in this country. The point is highly debatable, and has not yet been proved, at any rate, to our satisfaction. Even if the suggestion be true, the cause might well be attributed to our fiscal and economic policy, which increases cost of production; and as the sale prices must approximate towards the same amount, it is easy to understand why costs have to be kept down at all risks in order that some business may be obtained. If the Government pays £220,054 a year for telephonic apparatus from abroad that is better than similar apparatus at the same price produced at home, it is to be commended; but at the same time if the cause of the worse material here is to be traced to the negligence and inactivity of the Government, then the condemnation of the Government must be far and away greater than the commendation. The history of telephony in this country is one of the most interesting even from the manufacturing point of view. We ought to have been in the forefront of manufacturing, but we are not. The same statement can be truthfully made of other branches of manufacturing, and it will prove a hard nut to crack for politicians to tell us why capital from abroad has had to be brought into this country to exploit and develop various branches of electrical manufacturing. So far as this state of affairs is due to politics it means that there is a total decay of political virtue, that we are broken up into small parties, cliques—every clique thinking of private interest and forgetting the public. Broad-mindedness is almost entirely wanting, and the nation is suffering from wilful and not from simple, helpless ignorance. It was cliquism and wilful ignorance that brought about the condition of affairs telephonic, and has necessitated the spending of money abroad. At the present time everybody interested in these matters wants to know what the next move will be. There is no certainty of anything, except the uncertain. Out of the huge expenditures of the Government comparatively little is spent abroad, this telephonic item being by far the largest that interests us; and we call attention to it, not so much for itself, as for its indicating the larger purchase in other directions. The march of progress means that capital must be sunk in the production of apparatus to meet the

Digitized by Google

wants of modern requirements. In many instances capital is not forthcoming; hence development cannot take place at home. It is forthcoming for production abroad, and the early birds abroad have the pick of the world's markets. They are always a little ahead, because they were first. This country has been ahead in its business because it had the run of the world's market before any competition was possible, but now it leaves others to take the initiative—to produce and obtain a market—and expects to find it as easy to oust as to retain. A wrong policy, a ruination policy, but one that seems to be gaining ground. The world moves on, and what was possible half a century ago is impossible now. Telephony is not the only direction in which the markets of the world are occupied, and if this country does not soon waken to the altered conditions of affairs, its business will be like the old grocer's who kept on in the way of his grandfather and saw his rivals successful.

RAIL CORRUGATION.

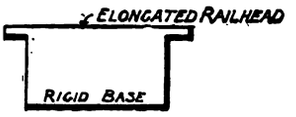
BY ROBT. B. HOLT, PERMANENT-WAY ENGINEER, CITY TRAMWAYS, LEEDS.

There has been so much discussion from time to time as to the effects of expansion and contraction on tramway rails, and so many theories propounded, that in these days of close joints and welded rails one is apt to wonder at the resurrection of a subject which appears to have been settled satisfactorily, by both theory and practice, for some considerable time. I claim the readers' indulgence and beg to present the old subject in a new light—viz., with regard to the corrugation of rail surfaces which is becoming so prevalent, and such a source of anxiety to tramway managers and engineers.

Before entering upon the relation between expansion, contraction, and rail corrugation, it may be interesting to consider a few items forming the subject matter of a very clever paper by C. V. Boys, Esq., F.R.S., which appeared in the *Tramway and Railway World* in 1902 at a time when the question of welding tramway rails was being given much consideration. The author of this paper states: "That a change of temperature of 10deg. C. represents an elongation of nearly 7in. in one mile of welded rail, also that a steel rail can be compressed or extended a two-thousandth part of its length by a force of 14·223lb. to the square inch; the same rail when warmed 1deg. C. will become longer by eleven-millionths of its length. Combining these figures, it will be found that if a steel bar is warmed 1deg. C. and at the same time subjected to a longitudinal compression of 313lb. to the square inch of section it will not change in length at all, or if warmed 10deg. C. and compressed with a force of 3,130lb. to the square inch of section it will retain its original length. So far as the rail is concerned, a change of temperature of 10deg. C. in the rail will not do any harm. For rails exposed to the sun by day and the sky by night 10deg. C. is not one quarter of the possible change of temperature, but the rails being buried except at the head, though 10deg. C. may be exceeded, it can never penetrate sufficiently into the lower part of the rail as to set up longitudinal stress approaching destruction." Also that "the adhesion between the rail and the road will be sufficient to withstand the longitudinal force."

Practice has proved Mr. Boys's theory beyond all possible doubt with regard to the body of the rail; there has been no perceptible elongation of rails and subsequent damage to both tracks and roadway. The results on the whole with close joints have been more satisfactory; and with regard to welded rails, they are the acme of perfection—that is, if welded when rails are laid—there is no drop of the car at the joint, no "hammered-out" ends, deteriorating day by day; and in place of these evils we have easy running with oscillation reduced to a minimum.

But to return to corrugation; this new disease which is shortening the life of our rails, what is the cause of it? The writer does not presume to say, but rather to point to that which appears significant from a practical standpoint. If a change of temperature of 10deg. C. represents an elongation of 7in. in a mile of exposed rail, what effect has this or a much greater change of temperature on the surface of an ordinary tramway rail? The lower portion being buried, of course. We may take it that it is not possible for an upper layer of the rail head to elongate, and the lower part to retain its normal length, when the joints are close, as shown in the sketch. What will result from the effects of the expansion of the upper part of the rail head under a change of temperature of from, say, 10deg. to 30deg. C. or more?



It appears to one, then, taking a practical view of the case, that as this assumed upper layer, which is exposed to all the changes of temperature, can neither elongate nor shorten longitudinally, it must naturally take a course where there is less resistance. It is, therefore, the opinion of the writer that the stresses called into play by a rise of temperature exert themselves along the surface of the rail in a longitudinal direction, and the top layer, being unable to elongate in a straight line, it buckles or corrugates in the way now, unfortunately, so well known to all connected with electric tramways. Precisely the same result can be obtained, taking a humble example, by applying end pressure to some thick elastic material such as soft pitch. Of course, the corrugations, if arising from this action, may be almost imperceptible to begin with, but they will rapidly become more evident by the action of the rolling-stock.

Corrugation is a growth of recent years, and in the days when $\frac{3}{16}$in. was allowed to counteract the effects of expansion, corrugation was unknown. Was this because the upper layer of each rail had room to expand? Take the case of a track the writer has heard of. It has been down seven years, and corrugation is only now appearing. Provision was made for a small amount of expansion at the joints; but in course of time, the rails probably being somewhat soft, this gap has disappeared owing to the metal rolling over it. Does it not seem to point to the effect of the temperature on the rail head? The same can be said of tracks that have been welded after being laid and used for a similar period. When they were welded, thin rail sections were inserted between the rail ends to close the gap, and within a year or two the corrugation appears.

Again, what a number of old tracks, tracks that were neither anchored nor concreted over the rail base, are deformed and rendered a positive switchback owing to the rails "hogbacking." There is something significant in the very appearance of a track in this condition. We shall probably find that the rails were of a much lighter section than those now used, and were not laid in such a rigid manner, therefore it appears possible that the variations of the temperature have some little to do with the action likewise.

This article has been written with a view to opening a discussion on the momentous subject of corrugation, in the hope that it will be freely criticised and the real cause discovered; at the same time the writer considers that it is far better to combat with corrugation than to revert to the old form of joint.

Madrid.—The Public Works Department require designs for a scheme of electric tramways in the town. Particulars from Direccion General de Obras Publicas, Madrid. Designs and estimates by Nov. 27.

TURBINES v. RECIPROCATING ENGINES.

BY DECAPOD.

As turbines are now becoming close running rivals with reciprocating engines for different classes of work, chiefly electric generator driving and ship propulsion, a valuable criticism on the operation of the two methods of obtaining the most efficient and reliable prime mover may be raised. In the case of the reciprocating engine, its operation is so well known that little can be said to enable it to be understood better than it is at present; it has almost reached the peak of its efficiency and reliability of operation for long runs under the worst conditions, such as driving a generator for heavy railway traction or shipwork in a heavy sea. Limits of steam pressure and temperature are low—450deg. F. for steam temperature is as high as can be considered safe for keeping good smooth rubbing surfaces, such as valves, pistons, and rods; higher temperatures necessitating expensive lubricating oils and a certain amount of uneasiness on the part of the man in charge if the engine is running with fine clearances. Then if surface condensers are used, there is always the trouble of extracting the oil from the hot-well before water can be used again for boiler feed. With triple-expansion engines it has been proved that a 26in. vacuum gives the best results, and, further, there is a limit to the expansion carried out in the low-pressure cylinder due to the condensation and re-evaporation of steam on the cylinder walls, etc. The advantages of reciprocating engines over turbines for shipwork is in the manœuvring, the small size of propellers necessary for the high speed of turbines making it more difficult, especially from rest in narrow waters.

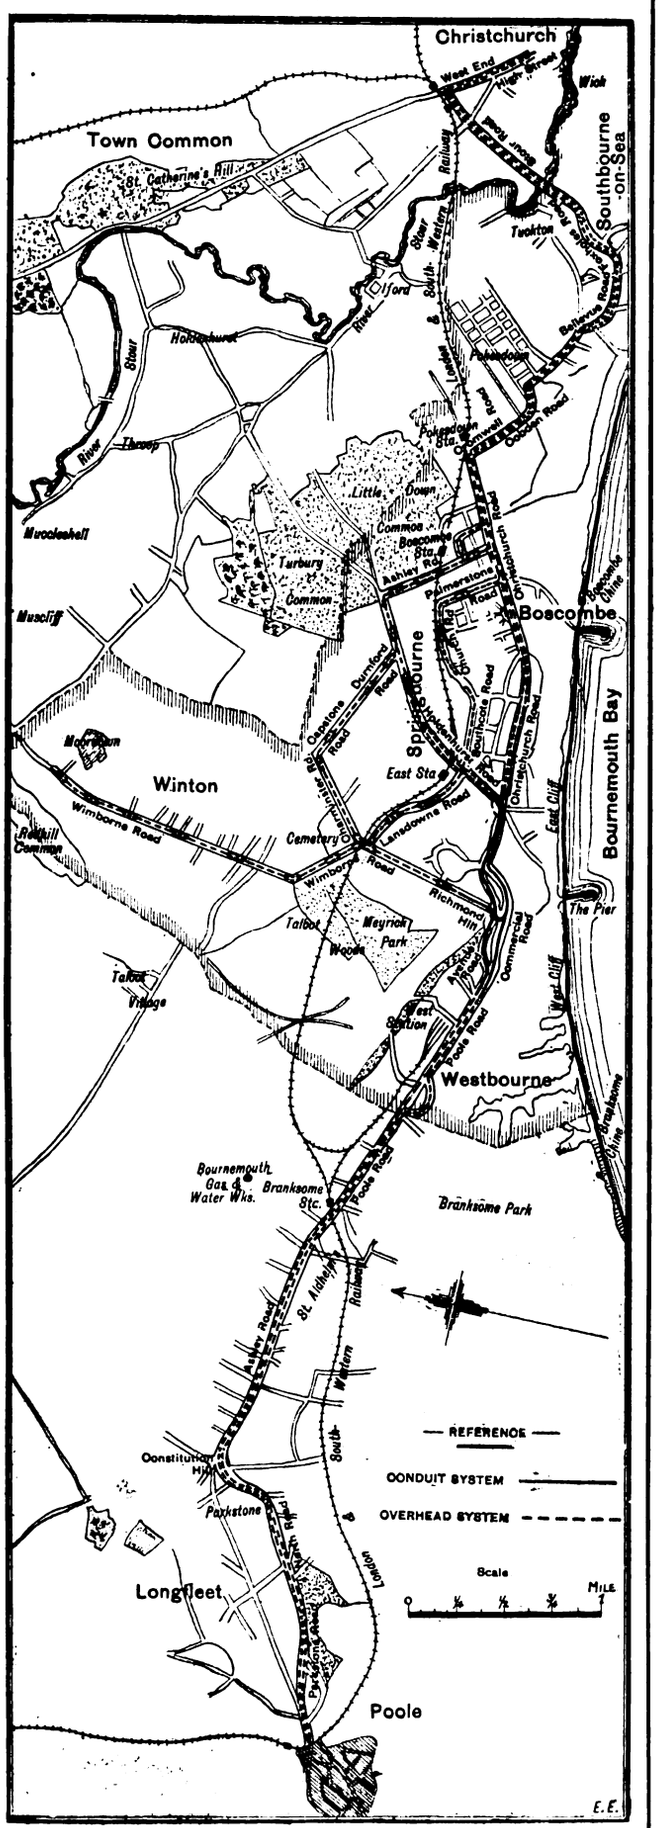
Trials have been made which show that turbine steamers going full speed ahead can be brought to rest in about a minute and a half. This is a good result, but actual experience has shown the relative inadequacy of going astern from rest. The case of the turbine is a most favourable one especially for central stations, it being an ideal drive for alternating-current generators in parallel on account of its equal turning movement. The turbine being a purely rotary motion with no rubbing surfaces, high pressure and temperature steam can be used with its full advantages, the only thing being slightly increased peripheral blade clearances for extra high superheat. The steam consumption of a turbine can be improved by 10 per cent. for 100deg. F. of superheat with steam at 160lb. square inch. Then, again, it pays to have the best vacuum possible, and the steam can be expanded to its utmost limit. The gain from an increased vacuum is so great that it is advisable to pay great attention to the design and upkeep of the condensing plant. For shipwork it is sometimes usual to fit a vacuum augmenter, by which means it is possible to maintain a vacuum of 28½in. in the condenser. Another good feature of the turbine is that it requires no lubricant mixed with the steam, therefore obviating the necessity of any oil extraction from hot-well water. In large turbines for central stations it is usual to have the bearings lubricated by the oil gravity system—that is, with a tank some 40ft. above the engine-room floor level, into which the oil is pumped from another tank below the engine-room floor level, the oil running from top tank through the bearing and into the lower tank to be filtered and cooled, then pumped up to the top tank to be used over again. Oil treated in this way will last for months, care being taken to keep water out of the oil, as it sometimes leaks through from the water-jacket on large bearings, on account of leaky castings. As in all engines, the governor is a very important consideration; a fly-ball type of governor is made use of. The speed of the turbine can be varied within all the limits of the governor spring whilst the turbine is running. This is particularly useful for bringing alternators into synchronism and adjusting their differences of load when in multiple. There being no variation of angular velocity in the turbine, which is necessarily present in reciprocating engines, heavy synchronising currents between two alternators in parallel are avoided. All power being transmitted rotatively, foundations are cheaper than for the same output in reciprocating engines. Many people imagine that the blades wear under the action of steam, but experience shows that with superheated steam this is not so. In the case of where steam is admitted through nozzles, slight wear is noticeable in the nozzles owing to the tremendous velocity of the steam. If there is any water in the steam, this wear is increased tenfold. The bearings of a turbine require to be run with very fine clearances, ·008in. being usual with forced lubrication. Very fine centring of the spindle in cylinder is necessary, as the peripheral blade clearances in sizes up to 500 h.p. are usually only ·02in. with 100deg. F. superheat; with sizes of 7,000 h p, with the same superheat, ·08in. clearances are necessary. The spindle should always be in perfect running balance on account of the fine peripheral blade clearances. The usual method of balancing heavy spindles is to lay them on knife-edges, gravity causing the heavy parts to come to the bottom. This method usually suffices, but no degree of real accuracy can be attained, as one cannot tell for certain which end requires the additional weight to bring it into balance. With smaller sizes it can be run up to speed and marked with a coloured pencil at different points which shows where to add additional weight. A small body revolving at 5,000 r.p.m., the light side is always the one that comes out, so that weight should be added where the marks are. In some cases the marks are different at each end, when weight needs to be added at each end to suit. For slower speeds than 5,000 r.p.m. the marks usually come at certain angles, leading the light side; this can easily be found by trials. As there are so few moving parts in a turbine compared to the numerous moving parts in a reciprocating engine, the repairs and replacements are small in comparison. Greater economy in oil and attention is on the side of the turbine, as they run cleaner, and all that has to be done is to turn on the steam and keep an eye on the oil to bearings. The chances of breakdowns on both the reciprocator and the turbine are probably equal, and the most serious breakdown for a turbine is the wearing down of the balance pistons through allowing them to come in contact with the cylinder casing. As the rings of these pistons are solid with the main spindle, it means turning off the whole of the piston and shrinking on a new end. This is a long job, and means throwing the turbine out of service for at least four weeks. Another serious breakdown is likely to happen from loss of oil to bearings. Such accidents have happened, causing bearings to seize and put such a strain on the spindle as to bend it. Once bent, it is difficult to get it back to its original position and seldom to make it run as true as before accident. A strip in the blades is for shore work usually only a stoppage of about five days in small sizes, and repairs can be effected on sight with ease, the reblading not being as difficult as it would appear to be. With good tools and men used to the work, it is surprising how soon a few thousand blades can be fixed in position. There is usually no sign indicated previous to a strip, and the first thing noticeable is a sudden grinding, then a full stop, the blades shearing off close to the main body of the spindle and becoming wedged between the spindle and the cylinder casing, no damage being done to any other part beyond the actual blades. The usual cause of strips may be put down to too fine clearances with excessive superheat, spindle being out of balance, and shaft whipping causing blades to rub, a heavy dose of water from boilers while on load, or a weak blade breaking off and fouling. A strip does not mean the whole of the blades, and may be anything from two rows to twenty. These three breakdowns are the only ones that can happen of any serious moment, and with the ordinary amount of care and intelligence it can be proved that the turbine is becoming as reliable as the best reciprocating engine.

BOURNEMOUTH TRAMWAYS.

The accompanying map of the Bournemouth tramways shows the extensions referred to in our last issue. The extension on the west to Poole, it will be seen, lies within that borough and the Branksome urban district, while that on the east to Christchurch lies partly within the borough of Bournemouth and partly in Christchurch. The former

Digitized by Google

consists for the most part of a line recently purchased from a local company, while the latter is of entirely new construction, as stated in our previous reference. With



Map of Bournemouth Tramways System.

regard to the extension to Poole, it may be added that Branksome is shortly to be incorporated with that borough. The distance between the termini at Poole and Christchurch respectively is about 10 miles, and the conduit sections of tramway occur almost in the centre of the system as shown. Work on the Christchurch extension was commenced on June 1 last by Messrs. J. G. White and Co, Limited, who secured the contract for the permanent way at £38 960. The construction of a new bridge over the river at Tuckton was involved, and the contract for this, including abutments, was let to the Yorkshire Hennebique Company at £4,500. The amount of the British Electric Equipment Company's contract for the overhead line work was £4.315 and that of Messrs. Johnson and Phillips, Limited, for the feeder cables, etc., £5,405. We find we were in error last week in crediting Messrs. Callender's Cable and Construction Company, Limited, with the whole of the cable work for the Bournemouth tramways. They supplied and laid the cables for the original scheme, but not for the Christchurch extension. It may be repeated here that the route length of this extension is 3½ miles, and the total length of single track laid about 5½ miles. Thus the new track is not double throughout as it is represented to be on the map.

In two respects the system of tramways completed by these extensions is especially noteworthy. Firstly, it illustrates the possibilities of the conduit and overhead trolley systems in combination; and, secondly, gives a foretaste of that commonsense era when local authorities shall co-operate to provide improved facilities for intercommunication between towns and districts within natural areas of relatively dense population.

CONSTRUCTION OF CANADIAN NIAGARA POWER COMPANY'S 100,000-H.P. HYDRO-ELECTRIC PLANT AT NIAGARA FALLS, ONT.*

BY CECIL B SMITH, MA.E, M CAN SOC C E.

When the writer became resident engineer for this company in August, 1901, he found that the location of the works and discharging tunnel had been already decided upon, and a shaft for tunnel construction partly sunken, and under directions from Consulting Hydraulic Engineer Herschel the turbine units were being given preliminary study by Escher, Wyss, and Co., who also finally designed them. Aside from the tunnel, which evidently should be built at once of full capacity, the construction then authorised was for a canal of 50,000 h.p., with temporary cribbing on the south side, a wheel pit for 50,000 h.p., and machinery and power house for 30,000 h p., but the company in 1902 decided to build the canal for 100,000 h.p., the wheel-pit for 110,000 h.p. (one 10,000-h.p. unit as a spare), to erect a power-house for 50,000 h.p., and equip it with machinery to the same extent; and this plant, along with conduits for carrying underground cables to Niagara Falls, N.Y., and to a transformer station for 25,000 h.p. outside Queen Victoria Niagara Falls Park, is now practically completed, and is in partial operation.

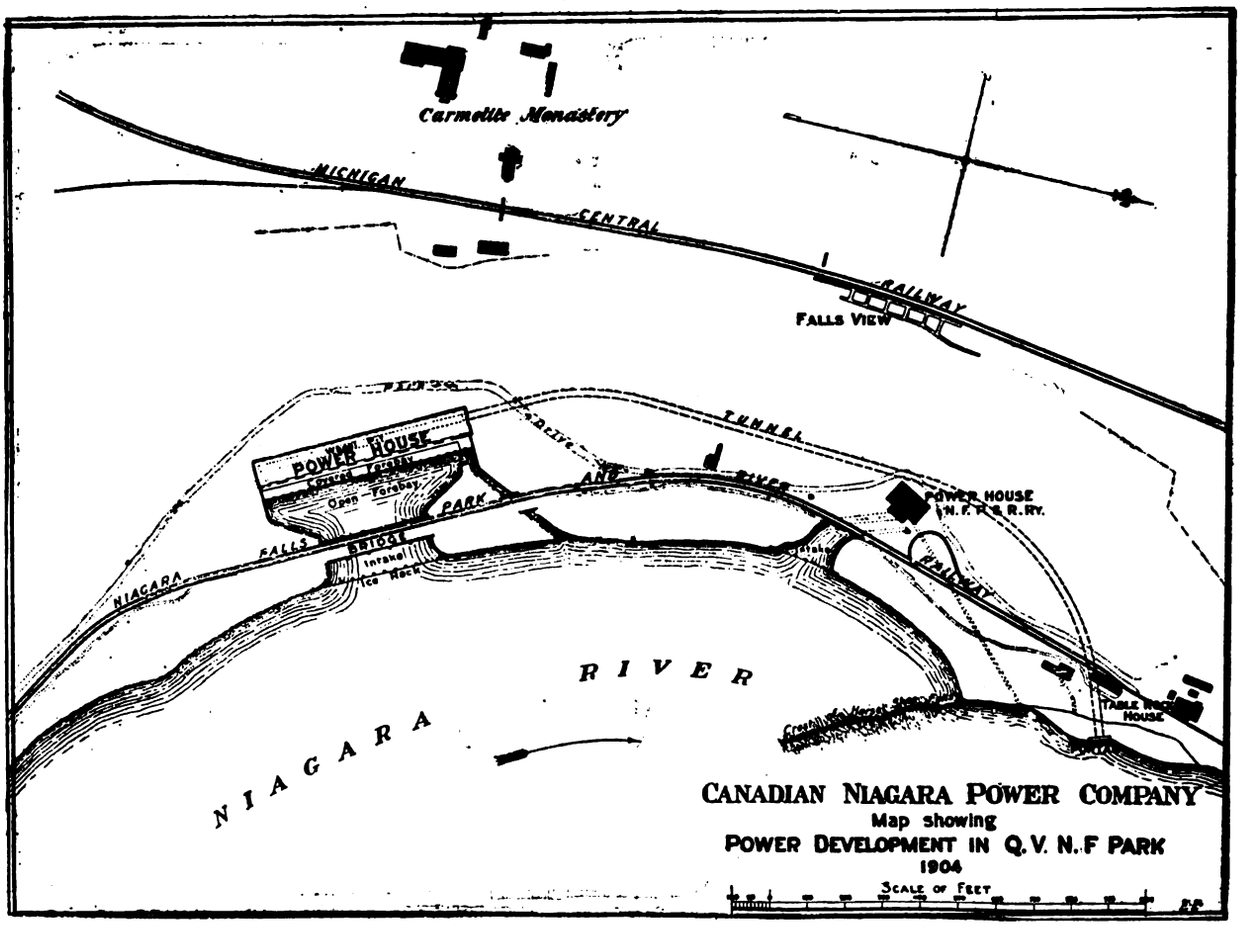
Some hazardous and approximate soundings had been taken in the Niagara River at the canal entrance, but they gave assurance that the depth of water adjacent to the shore was sufficient without extending operations very far out into the rapids, and a cofferdam was built. The cribs, if placed separately, would have been in rather unstable equilibrium, and the contractor accordingly sunk them in pairs, with turnbuckles in place, using temporary binding timbers to hold each two cribs in correct relative position until sunken into place, after which these timbers were removed by divers. The soundings for each crib were taken from a platform extending out over the water from the cribs previously placed, and the bottoms of the cribs were framed upside down, so as to fit the inequalities of bottom, denoted by the soundings. A floor for sustaining the rock filling was also placed in each crib as nearly as possible to the bottom, and the cribs were partly loaded before being floated into place. In order to hold on to the cribs when placing them in a current of 10ft. to 12ft. per second, several lines of wire rope operated by hoisting engines were used, and only one mishap occurred, when the bottom of the large corner crib was torn off. It was

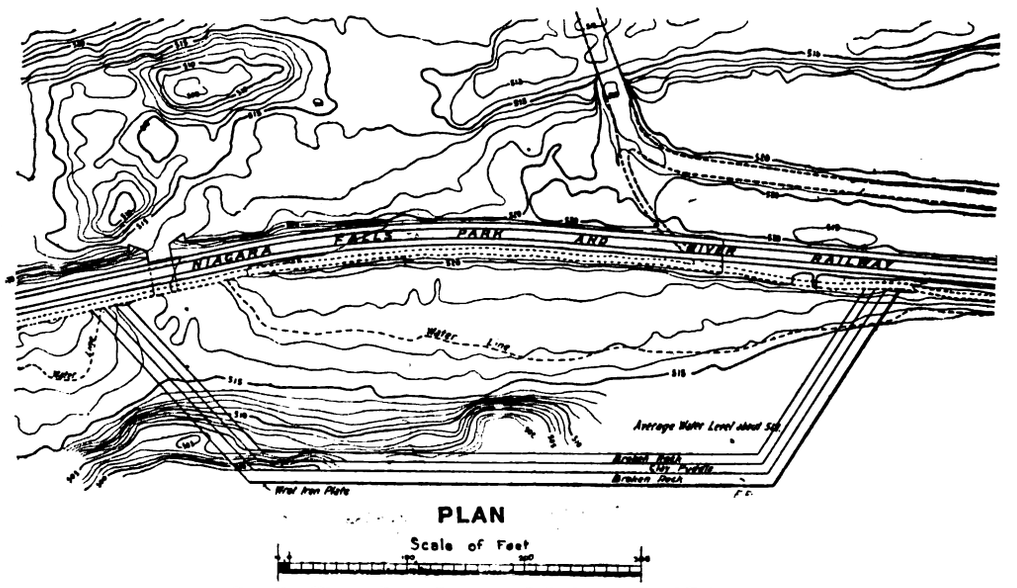
* Abstract of paper read before the Canadian Society of Civil Engineers.

Digitized by Google

found advisable to add vertical binding timbers, not shown on plan, when cribs were to be placed in the heavy current. These are being found of advantage also during the removal of the cofferdam.

The puddle used was composed of about two-thirds gravel and one-third clay artificially mixed, as a natural mixture could not be obtained within a reasonable distance, and this mixture was found to fall quickly into place whenever leaks opened up, and could be rammed into a perfectly water-tight mass. It was found best, however, to keep the puddle wall well below water-level on one side, so as to enable leaks to be promptly reached and the puddle to settle quickly. The continuous decking was built in place as soon as cribs were filled with rock, and being tied across by timbers above water and turnbuckles below, the cofferdam acted as one mass. In placing tongued and grooved sheeting it was broomed down by hand mauls on to natural bottom, and fitted snugly around timber ties and turnbuckles, after which all openings at bottom, located by divers, were made tight by piling bags of rich cement mortar and ramming them into the apertures. When the cofferdam was pumped out by a battery of 12in., 10in., and 8in. centrifugal pumps lifting about 10,000 gallons per minute, it was found that there was, even after temporary leakage through puddle had been cut down to nominal proportions, a heavy flow of water through the boulders and gravel lying between the cofferdam and solid rock, and as this would have to be handled for over two years it was considered advisable to take steps to stop it, and a puddle trench was sunk to rock at each end of area unwatered, being carried in each case from shore to adjacent points on inside of cofferdam. The cofferdam proper was sheeted on inside between these two puddle cut-off walls, with double tongued and grooved sheeting extending from above water-level down to solid rock, layers of tar paper being placed between the two layers of sheeting, and in order to





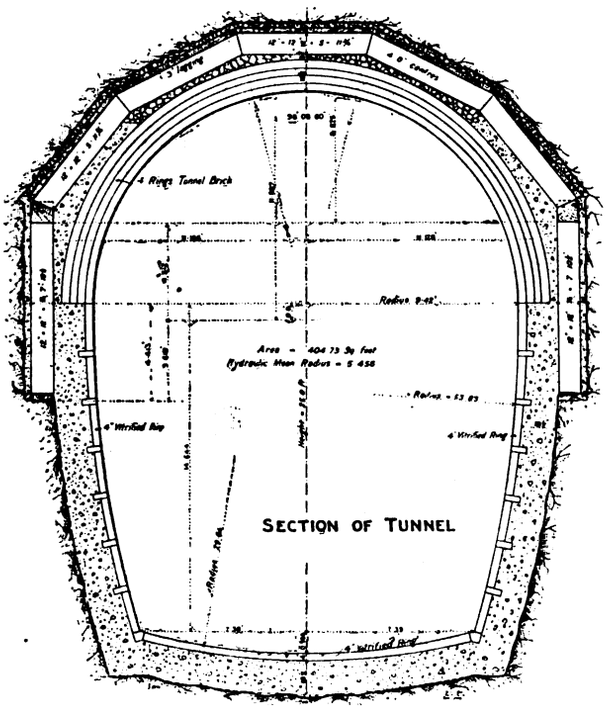
Canadian Niagara Power Company—Cofferdam for Canal Entrance.

Digitized by Google

seal the bottom a toe of rich concrete was carried along the bottom, being tied to the rock by thoroughly washing the surface of same, and spiking a heavy line of timber, about 12in. above the bottom, to the sheeting. This interior sheeting held the pressure of water against it until torn off when letting water into the canal, and the whole leakage was cut down to about half of the capacity of one 8in. pump during this period of over two years.

The original intention of the company was to build a steel bridge across the entrance canal, but it was subsequently decided to build a stone and concrete bridge 55ft. wide, composed of five spans of 50ft. each. Canal walls of rock-faced coursed ashlar, backed by 1 : 3 : 5 concrete, were carried out into the river by 50ft. curves. The wheel-pit, which is 570ft. long and 18ft. wide after lining, was excavated through 15ft. of boulders and gravel, 100ft. of limestone, and 50ft. of shale, the sides being separated before blasting by channelling.

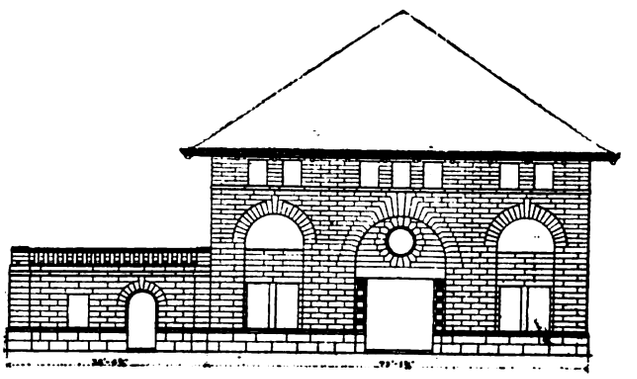
The original design for the tailrace tunnel was of a section 21ft. high, with brick lining 16½in. thick, but this was finally modified to the present section, which is 25ft. high, and has a composite lining, the bottom and sides being of concrete, faced with 4in. of highly-burnt brick,



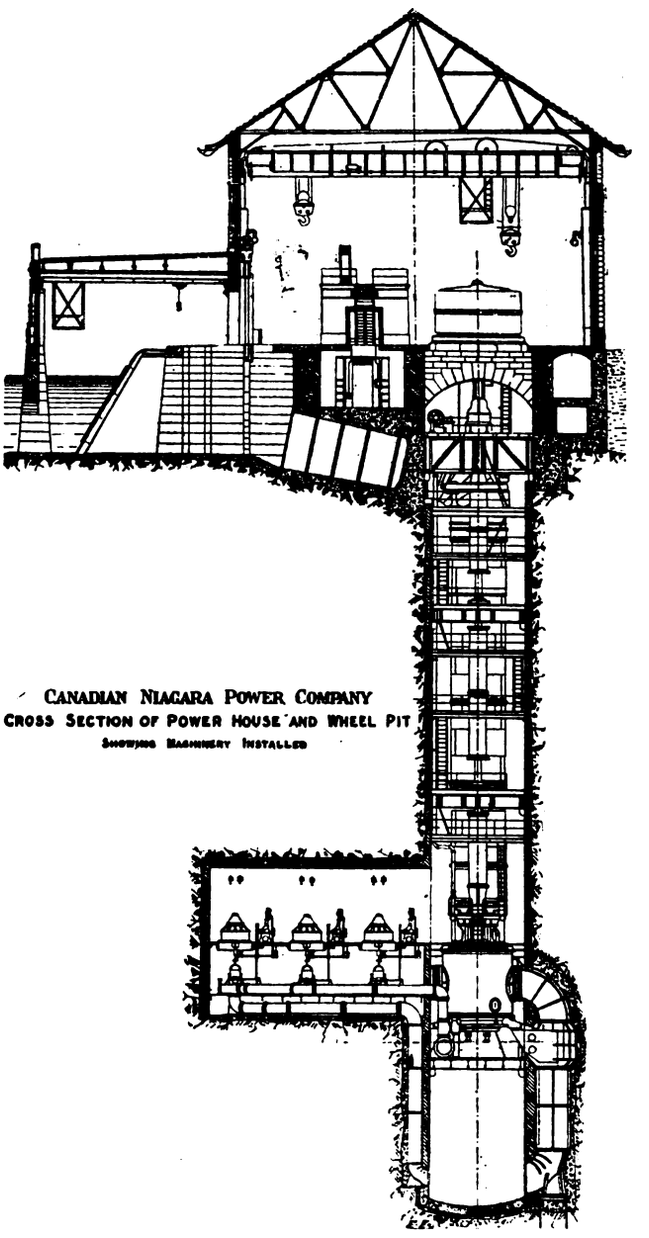
Canadian Niagara Power Company—Section of Tunnel.

while in the arch a brick ring with dry packing was adhered to on account of the difficulty which would have attended the building of a concrete arch. When the discharge tunnel was built for the Niagara Falls Power Company there was no exact information as to the value of the friction coefficient for a brick-lined channel of such large dimensions carrying water at a high speed, and even when the present tunnel was commenced the United States tunnel had not yet been tested to its full capacity, nor properly calibrated, but an examination in the winter of 1902 showed the brick lining, although of a very ordinary quality, to be absolutely intact, unworn, and slimed over after seven years' use, with water flowing at about 27ft. per second. Still, to make assurance doubly sure, the brick facing of the present tunnel was made of a superior burnt smooth brick, and the section made about 20 per cent. larger than the earlier one, so that the velocity will be slightly increased as the grade of 7ft. per 1,000 is continuous, and the alignment of the tunnel very favourable, consisting of two curves of long radius with direct outlet in line with wheel-pit. This tunnel is 2,200ft. long, including the headworks at portal, which consists of a square headwall 60ft. wide, 12ft. thick, and 55ft. high, extending to a depth of 35ft. below water-level, resting on a foundation well into the Medina sandstone; from this headwall the tunnel rises in an ogee curve for some 80ft. to the tunnel proper, and this portion is lined with 2ft. of granite, which it was considered advisable to use in place of brick, owing to the excessive speed of the water when dropping to the river-level, it being understood that the invert of the tunnel at the top of the ogee curve is at the low-water river-level.

The excavation was carried both ways from a shaft sunk midway between the portal and wheel-pit, and was



FRONT ELEVATION OF POWER HOUSE



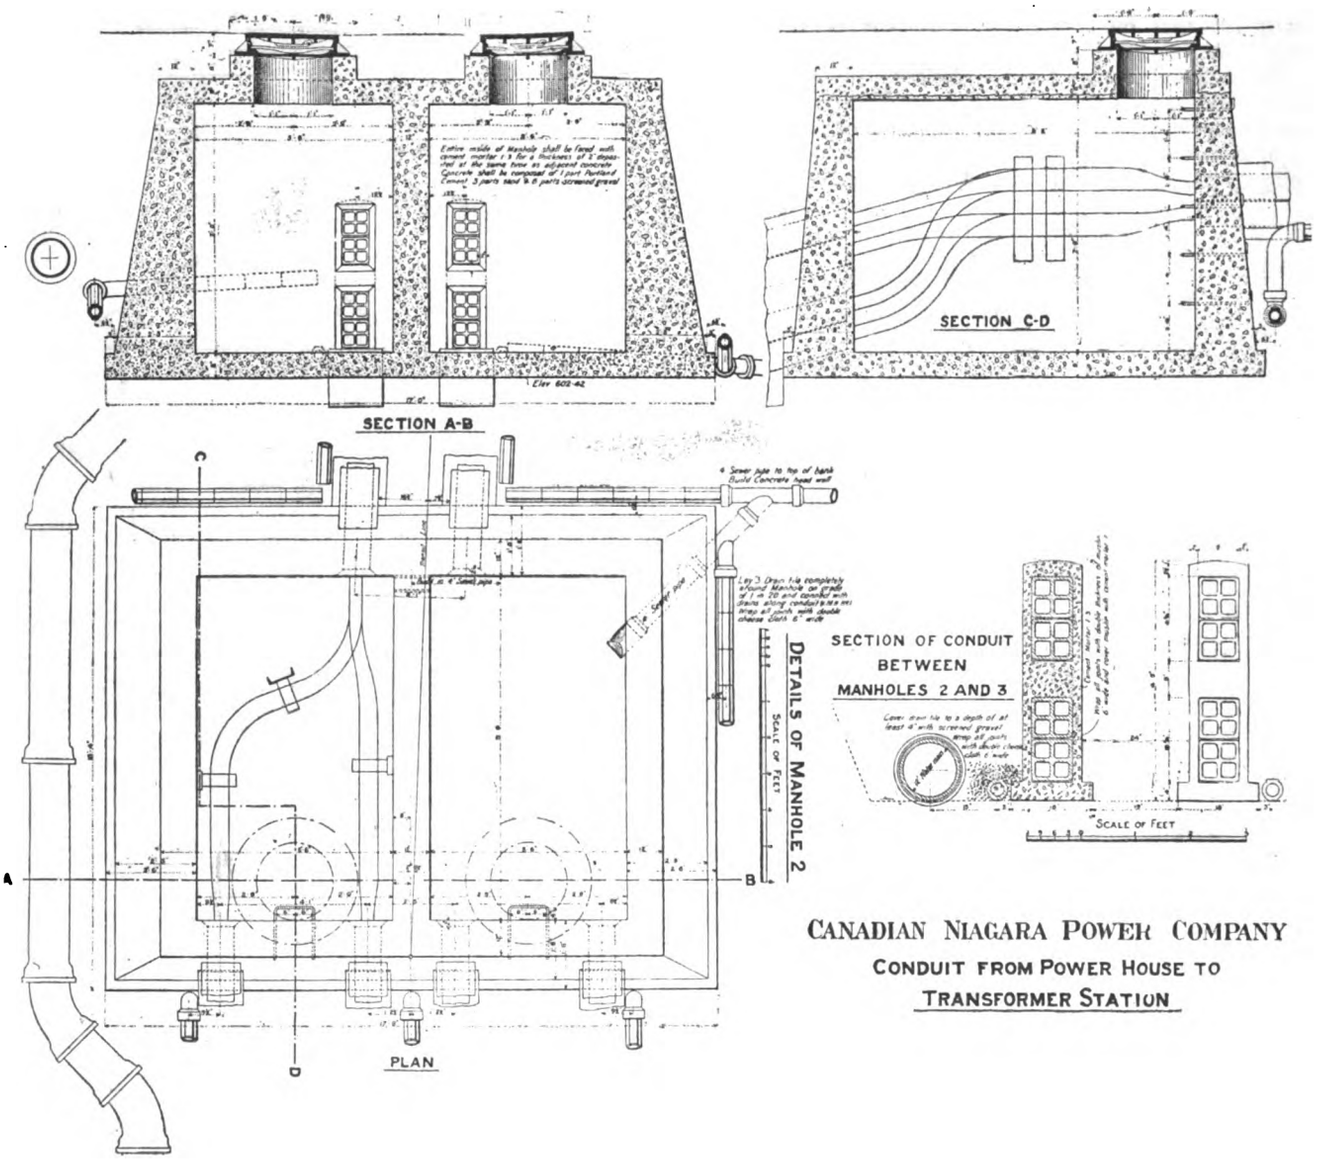
CANADIAN NIAGARA POWER COMPANY
CROSS SECTION OF POWER HOUSE AND WHEEL PIT
SHOWING MACHINERY INSTALLED

also carried in several hundred feet from the portal, and although the alignment was fixed from two piano wires 12ft. apart, suspended in the shaft, the instrument work at point of meeting of headings was found to be almost perfect, which must be looked on as a result of extreme care in the use of plumbobs, and taking the average of a large number of observations in this and surface instrument

Digitized by Google

work. Owing to the upper portion of the tunnel being in shale, it was necessary to carry a full timber roof consisting of five centred 12in. by 12in. rings 4ft. apart and 3in. lagging, and these were put in place, along with the wall plates, as fast as the headings were driven, while the plumb posts, carried down to limestone, were inserted at the time the two benches were being taken up. The original idea was to use yellow pine timber, but this was modified by substituting hemlock for centres and plumb posts, where the stresses would be compressive, and, although they were much abused by blasting, the result was satisfactory, owing to the absence of much water to soften and swell up the shale roof; the portion of roof adjacent to the wheel-pit was subject to leakage when the pit excavation was being done just above the tunnel level, and at this point the roof timbers were badly crushed, and the centres settled several inches, the fibres of the hemlock segments being forced into one another.

The process of lining the tunnel was as follows: The concrete invert (1 : 3 : 5) being laid, the vitrified brick invert was placed as far as the corner specials; side forms were then put up, and lagging, wedged back 4½in., was placed as high as the first course of brick headers. After the concrete side walls were built up to this height, the lagging was removed, and the brick facing carried up to and including a header course, after which the process was repeated to the springing, the only variation being that dry packing was used between and behind the plumb posts, in place of concrete shown on plans. The brick arch was built in the ordinary way on full centres, and 4in. by 4in. lagging, a night man building in the key of the arch work done during the day, and labourers placing dry packing above the haunches and driving it home against the roof timbers, also removing centres after being in position two or three days, and bringing them forward to a new position. After side forms and arch centres were removed, the whole tunnel was scraped clear of all mortar with sharp iron tools, leaving the surface smooth and clean. It is believed that a very low friction coefficient will exist in this tunnel, especially when the walls become slimed over with deposits from water, such as have formed on the walls of the Niagara Falls Power Company's tunnel. The shaft for this tunnel was sunk from May to September, 1901. Excavation was completed December, 1902, and lining and headwall in May, 1904, after which the shaft was bricked up, and outlet excavation at portal completed during the summer of 1904. No attempt was made to hasten the completion of this portion of the plant before the machinery installation demanded it, otherwise much greater speed could have been made.



Power-House.—The superstructure covering the generators and switchboard, etc, is a heavy steel-framed building, at present covering five 10,000-h.p. units, but the design is for a complete building 600ft. long, covering 11 10,000-h.p. units, with main entrance at the north end. The main building is 40ft. high to the eaves, and has crane girders 31ft. above the floor, this height being necessary for proper movement of large loads from one part of the power-house to another, after the machinery was installed. The proper light effect is obtained by large arch windows below the crane girders, and a series of smaller square ones just below the eaves. The exterior walls are of Queenstone gray limestone, with sufficient tooling for rich quiet appearance, and the interior lining consists of a wainscoting of enamelled brick up to the window sills, then a belt course of green-veined Vermont marble in line with marble window sills. Above this the lining will be buff

Digitized by Google

brick, which will give ample light in the daytime, while at night there is an arc light on each side of the power-house every 24ft. The roof of the main power-house is of steel and terra-cotta tile only, the tiles being interlocking green Ludowici, pointed with mortar, and the eaves are carried well out with a slight upward curve, ending in heavy copper gutters.

The forebay room is attached to the east side of the power-house, and has a flat steel and concrete promenade roof, with an asphalt and tile floor. It is surmounted by a stone parapet wall with 24 foot panels, it being proposed to place electric light columns and flower vases at the panel posts; while, for the purpose of throwing light into the room itself, in addition to arch windows every 24ft, there is a wide continuous skylight in the roof adjacent to the power-house. In the forebay room a five-ton travelling crane spans the whole width, and will assist in keeping racks clean, and lifting them when necessary. All the main window frames are metal, which leaves only the window sash and small upper window frames of wood, so that, practically speaking, the building is strictly fireproof. At the north end the main entrance door will be of bronze with carved side columns, and surmounted by a panel containing the company's seal; while stretching across the north end of the power-house will be a visitors' gallery, from which the best view of the interior of the building can be obtained.

Underground Conduits.—In order to convey current from the power house two lines of conduits were constructed, of the style shown in the illustration, one of which, 2,200ft. long, leads to a transformer station located outside the public park, and the other, 1¼ miles long, extends from the power-house through the park to the upper steel arch bridge. The four-way ducts are embedded in a 1 to 7 gravel concrete, and are spaced generously so as to provide proper heat radiation, it being found that in a large group of cables the centre ones do not have the carrying capacity of the outer ones. The manholes are also entirely of gravel concrete, and are drained thoroughly with 6in. tile, into which are carried the farm tile, laid alongside the ducts themselves; and a curtain wall divides the manholes into two parts, while a further separation in case of fire is obtained by soapstone slab partitions lying horizontally between each group of cables. The ordinary type of manhole carries the cable straight through without any appreciable bends, and a 12in. water-main is used for carrying water from the pumps, located in the power-house, to the water-cooled transformers and stand-pipe situated outside the park on the company's land.

(To be continued.)

ISLINGTON ELECTRICITY ACCOUNTS.

The accounts of the Islington electricity department for the year ended March 31, 1905, show a total expenditure on capital account to that date of £406,436. Abstracts of the revenue account and balance-sheet are given herewith.

REVENUE ACCOUNT.

PERSONAL.

Mr. John E. Pitcairn, J.P., tramways manager, was entertained to dinner last Friday evening in celebration of the completion of 21 years as manager of the Edinburgh and District Tramways Co.

Mr. Eric S. A. Smith, of 51, Trinity-road, Bridlington, has been appointed canvasser for consumers of electrical energy at the Batterseas electricity works at a wage of £2 a week and commission.

Mr. Richard Jones, late manager of the Electric Construction Works, Bushbury (who is succeeded by Mr. H. Jones, new works manager), was last week at a complimentary dinner presented with a handsome marble timepiece, a pair of bronzes, and a purse of gold.

Mr B. Sherman has resigned his directorship of the Amalgamated Dry Batteries, 16-17, Devonshire-square, E.C., and Mr. F. Heron-Rogers has been elected in his place.

Mr. E. Trenam, controller of the Central Telegraph Office, St. Martin's-le-Grand, is retiring under the age limit after a long and useful service. He was appointed traffic manager, secretary's office, in 1900, deputy-controller in 1901, becoming controller of the central telegraph office in 1902.

Mr. E. Fenton, who has been a student in the York electricity works for the past four years, has been appointed junior assistant mains engineer. This appointment was inadvertently inserted under "Appointments Vacant" in a previous issue.

A smoking concert was held last Friday evening by the members of the Recreation Club of the Hull tramways electrical engineering department. During the proceedings a saddle was presented on behalf of the club by the chairman, Mr. J. Wilkinson, to Mr. H. Garrington, the chargeman over the electrical department at Liverpool street, who is shortly leaving the Corporation's employ to return to his previous occupation of farming.

The Willesden Board of Guardians have appointed Mr. A. Moorhouse, of Burnley, engineer-in-charge in connection with their electrical installation.

The Northampton Institute have made the following appointments for instructors in mathematics for their engineering courses: Mr. D. Heron, M.A., for day courses, and Mr. W. H. Pretty for evening courses.

Mr. R. Hugh Seabrook, of Barking, has been appointed electrical engineer to the West Ham Corporation.

LEGAL INTELLIGENCE.

CLAIM FOR DAMAGES.

At the Scarborough County Court on Tuesday last, before his Honour Judge Raikes, the Scarborough Tramways Co. were sued by George Weatherill, cab proprietor, Scarborough, for £148. 12s. 6d. for damages caused to his horse and landau; £66. 12s. 6d. had been paid into court with denial of liability.

The counsel for the plaintiff stated that the claim related to an incident of July 3, on which date plaintiff was driving from Valley-road to Westborough, and at the time was proceeding up Falconer's-road, down which road there was a double set of tram-lines. As plaintiff drove up Falconer's-road he saw in front of him a cab, driven by a man named Cattle, going up the hill ahead of him, and that the tram which was stationed near the Aquarium had started, and was coming up the hill. Both drivers knew that it was impossible for the tram to pass if they continued driving up the left side of the road, so they both drew into the middle of the road and allowed the tram to pass them. The car went ahead some little distance up the hill, and the cabdrivers resumed their journey, but the car had not gone far before it stopped and immediately began to back. It backed into Cattle's horse, which was forced back, the cab to which it was attached crashing into plaintiff's horse. As a result the latter "locked" the landau and backed towards the wall, causing the landau to cross the rails. The tram travelled down the hill into the landau at such a furious speed that it took the landau bodily down the hill. The landau was overturned, the occupant was thrown out, and plaintiff was thrown into the road. The tram was not pulled up until it got to the bottom of the hill, and the driver explained that his brakes had failed to act. There could be no question of presumption of negligence on the part of the defendant company. The admission of the driver that his brakes would not act was conclusive. That was not the first time occurrences of that sort had taken place in Falconer's-road and other hills. The trams in Scarborough had to ply in places which, on account of the steep gradients, required large motive power, which, it was suggested, they had not got; and what was more, the company required a system in regard to the structure of their cars which would enable them in emergencies of that sort to ply the brakes effectively. Evidence was called to show that that very driver had assisted in bringing a car up Falconer's-road on a previous occasion, which twice or thrice had refused to answer to the brake, showing the imminence of an occurrence of that sort.

For the defence it was urged there was no suggestion of defect in the tram. The company were prepared to meet the question of alleged negligent driving and management, but no suggestion had been made of any defect in construction. The suggestion as to the brakes being unable to control the car was utterly without foundation. What led to the accident was deliberate. As the driver of the up car was going up the hill he saw that a rolly was coming down quickly and attempting to get between the up and the down car, and the driver of the up car saw that unless he stopped, the rolly and its attendant would be crushed between the two cars. He stopped his car, therefore, and reversed it, not knowing that the two cabs were behind him, but he pulled up the car within two lengths, and there was nothing like the car running away.

The driver of the car gave evidence, stating he stopped his car and reversed the motors to prevent the rolly coming down being crushed between his and the down-coming car. He did not know there was anything behind until he had run into the cab.

His HONOUR held that that was negligence on his own evidence. He had no right to reverse his car and go back without ascertaining whether anything was behind. He gave judgment for £93. 14s. 6d.

MUNICIPAL ELECTRICITY.

At the Brompton County Court on Friday last Sir Wm. Selfe heard an action brought by the Hammersmith Borough Council against Mr. J. B. Mulholland, proprietor of the King's Theatre. The claim was for electricity supplied to the defendant for a period lasting from May 25 to July 31, 1903, which had been reduced by mutual agreement from £80. 10s. 6d. to £52. 17s. 3d. This reduction had been made necessary by the fact that the first amount was arrived at from the reading of a faulty meter.

For the defence it was said that Mr. Mulholland was counter-claiming for £152 odd in respect of his loss of receipts by reason of the plaintiffs' failure to provide a continuous supply of electric current in respect of extra limelight which had to be provided, and of additional work which had to be done on account of plaintiffs' failure to instal their motor-generator at the time specified.

Mr. BELL, electrical engineer to the Hammersmith Borough Council, said that the local authority agreed to supply electric current to Mr. Mulholland at the King's Theatre when that place was in course of erection. The Council only supplied alternating current, but they agreed to have a generator installed whereby the alternating current could be converted into continuous current for the defendant's purposes. The defendant had continued to use the Council's electric current ever since, but he had not paid the account in which the mistake had been made.

On the counterclaim the Council submitted that there was no contract to supply continuous current before Dec. 1, 1903, and that therefore there had been no breach, and defendant had suffered no loss at the Council's hands; and, secondly, that the claim did not come within the jurisdiction of the Court.

On the other side it was argued that the Council were not bound to supply the defendant with alternating and continuous current, but seized the opportunity of doing so, because they knew it would pay them about £700 a year.

Digitized by Google

The JUDGE suggested that since a point had been raised concerning his jurisdiction, the parties might possibly come to some arrangement.

A consultation was held, and counsel announced that an agreement had been come to. Claim and counterclaim would be withdrawn, and the parties would pay their own costs.

COMPANIES' MEETINGS AND REPORTS

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.

The third ordinary general meeting of this Company was held on Tuesday last under the chairmanship of Mr. Charles T. Yerkes. The directors' report, which was presented at the meeting, stated that the works which are being carried out by the Company on the Metropolitan District Railway, the Baker-street and Waterloo Railway, the Great Northern, Piccadilly, and Brompton Railway, the Charing Cross, Euston, and Hampstead Railway, and the power-house, have made satisfactory progress since the date of the last report. Electricity has been supplied from the power-house at Chelsea through the transmission lines to Earl's Court, and thence through the District Company's own cables for the past six months, for the operation of that company's railway system. Five of the turbo-generators have been installed. The sub-stations for the operation of the District Railway are all completed and operating. The sub-stations for the Baker-street and Waterloo Railway are nearing completion and the machinery is being installed. The sub-stations for the Great Northern, Piccadilly, and Brompton Railway and the Charing Cross, Euston, and Hampstead Railway are in course of erection, and the machinery is being manufactured. All the work of construction on the Metropolitan District Railway has been finished. All of the lines have been opened for public traffic with electric trains. A few steam trains still continue to run during the rush hours, but they will be replaced by electrical trains before Nov. 1. A serious delay occurred in the delivery of the rolling-stock, which was contracted to be delivered during the months of November and December of last year. The balance of cars for this railway will be delivered this month. All electrical equipments for the cars have been received. The new car shops at Mill Hill Park, which have been equipped with the most modern and up-to-date appliances, are in full use, and it is expected that a very large saving in expenditure will result. All of the stations are now lighted with electricity. The construction of the tunnels and shafts between Baker-street and Westminster Bridge-road on the Baker-street and Waterloo Railway has been completed. Lifts are being installed, and the tiling is nearly completed. The permanent way is completed, and the conductor rails are being bonded. The car and repair shops at St. George's-circus are finished and completely equipped. The electrical apparatus for all the trains has been delivered, and is ready to be installed on the cars. A delay has occurred in the delivery of the rolling-stock, which has to some extent retarded the opening of the line, but it is hoped that the line will be opened for public traffic during the month of March next. The balance-sheet shows that the issued share capital amounts to £2,500,000, and there are £7,000 000 5 per cent. profit-sharing notes, other items bringing the total liabilities to £13,651,354. Among other expenditure to date is £8,257,591 on railway construction, and £1,218,697 on power-house, etc., at Chelsea.

In moving the adoption of the report, the CHAIRMAN stated that rapid progress had been made, and several matters had nearly reached the concluding point. Everything had been found to work as satisfactorily as could have been wished. A pleasing feature was that they were well within their estimates. All of the machinery was working well, and the receipts of the District Co. were increasing. Wherever electricity was in full force splendid results were being shown. In certain places steam had still to be used, but this would not be the case much longer, and he felt convinced that their most sanguine expectations would be fully realised.

Lord FARRER seconded the motion.

The CHAIRMAN, in reply to an inquiry, stated that experiments were being made as to the division of classes on the lines. It was not known precisely what the first-class passengers were going to do. Experience had shown that the Company had been giving 14 per cent. of space in the cars to carry 7 per cent. of the passengers. The Board had expected that there would be scarcely any first-class passengers, but in this view they had been mistaken. Their numbers, however, fell very low at first, but in the last three or four weeks they had increased, and they were now about 8 per cent. of the total. The whole question would be regulated according to the directors' experience, and if it were found that first-class cars were not required, they would be taken off. The chairman, in further reply, stated that a good deal more was seen in the newspapers about the smoke nuisance than was seen at the power stations themselves. There was only one power-house at Chelsea, and the smoke had been reduced "to the merest minimum." The only fault they had to find with the power-house practically was the great noise, and the Westinghouse Co. were now making every effort to get rid of this objection

The motion was then unanimously adopted.

EDISON AND SWAN UNITED ELECTRIC LIGHT.

The twenty-second ordinary general meeting was held last week, Mr. Henry Wolfenden presiding.

The CHAIRMAN, in moving the adoption of the report (particulars of which appeared in our issue of the 6th inst.), said that when they last met he expressed the hope that the Board would be able to declare a dividend on the present occasion. This forecast had been fulfilled. It was true that the dividend was only a small one, and was not a very adequate return for the years of waiting which the shareholders had undergone, but he ventured to suggest that they should regard it, not so much for what it was, but as a ground of hope for better things in the future. During the year the directors had endeavoured to conduct the business prudently and progressively, keeping ever in view a high standard of quality for the Company's productions and a reasonableness in their selling prices. He did not consider that any advance they showed in trading results was owing to an improvement in the state of trade generally during the past financial year, which had been a period rather of "marking time" in business as a whole, but since June 30 there had been distinct evidence of an improvement in trade, in which the Company had shared. He moved that a dividend of 2½ per cent. on the A shares be paid.

Mr. E. B. ELLICE CLARK seconded the motion.

Mr. JOHN BALFOUR congratulated the directors upon their success; they had, he added, rescued the Company from the throes of financial death. He moved a resolution voting them 750 guineas in appreciation of their services.

Mr. CRISP (the solicitor) pointed out that such a resolution was not legal unless special notice of it had been given; and it was agreed to insert notice of the resolution in the circular convening the confirmatory meeting.

The report was unanimously adopted.

A further resolution was also carried reducing the capital of the Company from £941,090 to £888,071, by cancelling paid-up capital which had been lost or was unpresented by available assets.

ANGLO-PORTUGUESE TELEPHONE.

The secretary, in a circular to the share and debenture-stock holders, states that the managing director (Mr. F. W. Kerr) has just returned from Portugal, and reports to the Board that the condition of the Company's affairs generally is very satisfactory. Since the installation of the common battery system in Lisbon a great improvement in the service has taken place, and Mr. Kerr received assurances from all sides that the service now leaves nothing to be desired. Three new exchanges—Caxias, Queluz, and Cintra—have recently been established; the work of installing exchanges in Almada and Barreiro, on the south side of the river, has now been commenced, and the necessary permissions for laying the cable under the River Tagus, to connect these places with the central office, have been obtained from the authorities. In Oporto the reconstruction of the system has been followed by a steady increase in the number of subscribers, and the future prospects in this place are also distinctly encouraging. The relations of the Company with the Government authorities continue to be most satisfactory. The proposal of the Company to establish telephonic communication with the south side of the River Tagus has been cordially received, as it supplies a want which has long been felt. The issue of £50,000 5 per cent. debenture stock, sold to the Consolidated Electrical Co., in April last, for £45,500, was all subsequently paid for on the due dates. The proceeds have been applied by this Company to the redemption of all outstanding debentures of earlier date; the debt due to the contractors has also been discharged, and the balance (£10,162) has been invested temporarily in short-date Colonial Government bonds, pending its requirement for the extension of the Company's telephone system in Portugal.

EASTERN EXTENSION, AUSTRALASIA, AND CHINA TELEGRAPH.

The report for the half-year ended June 30, 1905 (to be submitted to the meeting on the 1st prox) states that gross receipts during that period have amounted to £348,850, against £300,058 for the corresponding half-year of 1904. Working expenses, including £21,457 for maintenance of cables, absorb £135,960, against £141,707 for the corresponding period of 1904, leaving a balance of £912,900. From this is deducted £3,384 for income tax and £14,615 for interest, etc., on debenture stock, leaving £194,900 as net profit for the half-year. After adding £22,181 brought forward, there is an available balance of £217,081. Two quarterly interim dividends of 1¼ per cent. each, amounting to £75,000, have been paid for the half-year, leaving £142,881, of which £100,000 has been transferred to the general reserve fund, and the balance of £42,081 is carried forward.

WESTERN TELEGRAPH.

The revenue for the half-year ended June 30 amounted to £283,360, and the working expenses to £116,665. After providing £14,146 for debenture stock and debenture interest and sinking fund, and £5,136 for income tax, there remains a balance of £147,411; to this is added the sum of £3,891 brought forward from Dec. 31 last, making a total of £151,303. A quarterly interim dividend, amounting to £31,189, has been paid, and £60,000 transferred to the general reserve fund and £5,000 to the maintenance ships' reserve fund. The directors now recommend the declaration of a final dividend of 3s. per share, making, with the interim dividends, a total dividend of 6 per cent. for the year, and also the payment of a bonus of 2s. per share, both free of income tax, which together will amount to £51,982, leaving a balance of £3,131 to be carried forward.

ROSARIO ELECTRIC.

The report for the year ended June 30 last (to be presented to the meeting on the 31st inst.) states that the balance at credit of profit and loss account is £13,293, to which must be added the amount brought forward, £913, making a total of £12,206. The directors propose to allocate to amortisation of concessional rights, £500; depreciation on buildings, plant, and machinery, £1,981; depreciation on tools, stores, and furniture, £82; writing off half of the expenses of issue of 8,000 preference shares, £1,267; and after paying a

Digitized by Google

dividend of 3s. per share on the ordinary shares there remains to be carried forward £2,667. The number of 8-c.p. lamps connected, including theatres (about 11,300 lamps) at June 30, 1905, was 67,994. In view of the continued demand for lighting and power, the directors have ordered a fifth steam dynamo and accompanying boilers and accessories of 500 kw. capacity. The old station plant is still partially in use for serving the street-lighting. It will be necessary to increase the capital of the Company very shortly in order to meet the satisfactory expansion of business. Mr. Western, one of the directors, is now in the Argentine Republic. After the Board have received and considered his report, an extraordinary general meeting will be summoned to deal with the subject.

STIRLING AND BRIDGE OF ALLAN TRAMWAYS.

The annual general meeting of the shareholders of this Company was held in the secretary's office at Bridge of Allan last Saturday. Mr. T. A. Mortimer, Edinburgh, presided.

In moving the adoption of the report, the CHAIRMAN pointed out that there was an increase of £185. 4s. 5d. on the earnings as compared with the previous year, and of that increase the St. Ninians section contributed nearly £100. The expenditure under revenue showed an increase of £45. 10s., due to extra cost of horsing and increased taxes. The sum at credit of revenue was £793. 5s. 5d., as compared with £652 last year. He moved the adoption of the report, and that the dividend be 4 per cent. on the preferred and second preferred shares, and 2½ per cent. on the ordinary shares. Last year the amount written off was only £38.

Mr. KINROSS seconded, and the adoption of the report was agreed to.

Mr. Brand and Mr. Kinross were re-elected directors. Mr. E. Morrison, the auditor, was re-elected.

NEW COMPANIES REGISTERED.

London Outer Circle Railway Syndicate, Limited.—Capital, £20,125. Objects: to promote a company for the construction and working in the counties of London, Middlesex, Hertfordshire, and Essex or elsewhere of a railway or railways for the carrying of passengers, minerals, and goods by means of steam or electric traction or otherwise, and to apply for a special Act of Parliament relating thereto. Registered office: 266 and 267, Salisbury House, London-wall, E.C.

Hopper and Co, Limited—Registered Oct. 12. Capital, £8,000, in £1 shares. Objects: to adopt an agreement with P. Hopper and H. Wilson, and to carry on the business of electricians, electrical and general engineers, ironmongers, builders of electric tramcars and other vehicles, manufacturers, importers and exporters of and dealers in dynamos, motors, telephones, bells, batteries and electrical apparatus, etc. No initial public issue. Registered office: Elmsdale Works, Elmsdale road, Walthamstow.

Star Foundry (Brighton), Limited—Capital, £5,000. Objects: to acquire and carry on the business recently carried on at the Star Foundry, Bread-street, Brighton, and now at the Star Foundry, Shoreham-road, Portslade, as Geo. Burstow and Sons, as ironfounders, mechanical and electrical engineers, etc. Registered office: Star Foundry, Shoreham road, Portslade, near Brighton.

Electrical Instrument Manufacturers, Limited.—Capital, £5,000. Objects: to carry on the business of electrical engineers, contractors, etc., with a view thereto to enter into an agreement between T. Ward of the one part and H. G. Matthews of the other part.

Diamond Electric Lamp, Limited—Capital, £20,000. Objects: to adopt an agreement with H. Diamant and A. Chiesa, and to carry on the business of manufacturers of and dealers in arc lamps, electricians, mechanical and electrical engineers, manufacturers and suppliers of electricity for light, heat, motive power, or otherwise.

International Electric Railways and Water Power Syndicate, Limited.—Capital, £12,000 in £20 shares. Objects: to acquire concessions, rights, powers, or privileges relating to the construction of, and to construct, maintain, work, and use railways or tramways adapted to electric or other traction in any part of the world, etc.

Liens Registered.

Electric Conversion Syndicate, Limited.—An equitable charge, dated Oct. 13, 1905, to secure £16,500, has been registered. Property charged: uncalled capital to the extent of 7s. 6d. per share on 32,350 £1 preference shares in this syndicate; £47,500 first mortgage debenture stock of the South Lancashire Electric Traction and Power Co., Limited; 20,638 £1 fully-paid preference shares in the Sunderland District Electric Tramways, Limited; 18,441 £1 ordinary shares in the Durham Collieries Electric Power Co., Limited; 1,585 £5 preference shares in the North Wales Power and Traction Co., Limited; and 14,500 £1 shares in the Canadian Electric Traction Co., Limited. Holders: Messrs. Herbert Wagg and Russell, Southsea House, E.C.

Electric Safety Appliances Co., Limited (London).—A mortgage debenture, dated Oct. 14, 1905, to secure £100, charged on the company's undertaking and property, present and future, has been registered. Holder: R. J. Bott, 235, Phillip-lane, Tottenham.

APPOINTMENTS VACANT.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office. See advertisement.

Switchboard Attendant, Southend Town Council electricity works. Salary, £1. 1s. per week.

Assistant Lecturer and Demonstrator in Electrical Engineering, Leeds University. Salary, £175 a year.

Premium Pupil, Electricity Works, Canterbury. See advertisement.

Tramway Constructional Engineer for the Far East. Apply Box R 7, *Electrical Engineer* Office. See advertisement in last issue.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sell's Advertising Offices, London, E.C.

Resident Engineer, commencing salary £300, rising to £400 per annum; Sub station Superintendent, salary to commence at £250, rising to £350 per annum; and Shift Engineer, salary to commence at £150, rising to £250 per annum; Birmingham Corporation. Applications by Oct. 30. See advertisement in last issue.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Bermondsey.—Tenders for new plant will shortly be advertised for.

Vienna.—The Government Railways require tenders for telegraph tape. Tenders by Nov. 10.

Wimbledon—We understand that tenders will be called shortly for electric pumps for the sewage works.

Porto.—The Municipality require tenders for a concession for working the electric tramways in the town. Tenders by Nov. 8. Preliminary deposit, 100 contos de reis.

Stoke-upon-Trent.—The Guardians invite tenders for (1) rewiring a portion of the workhouse and cottage homes, and (2) replating the battery. Tenders by 9 a.m. on Nov. 1.

Felny (Belgium).—The Provincial Government require tenders for electric lighting of the town. Tenders by Oct. 31. Applications to the Town Hall, Felny, province of Hainault.

Shoreditch—The Borough Council invite tenders for the extension of plant at their Whiston street generating station. Tenders to the Town Clerk by Nov. 7. See advertisement.

Belfast.—Electric light and fittings are required in the Scottish Temperance Assurance Buildings, Belfast. Tenders to Mr. Henry Beaver, architect, 22, Donegall-place, Belfast, by Nov. 3.

Edinburgh.—The Parish Council invite tenders for an installation of intercommunication telephone system throughout the offices, Castle-terrace, Edinburgh. Tenders to the Clerk by 10 a.m. on Nov. 7.

Sao Luiz—The Municipality require tenders for electric lighting of the town. Tenders by Dec. 16. Particulars may be obtained from the Municipal Secretary of Sao Luiz in the State of Maranhao, Brazil.

Brisbane.—The Postmaster-General invites tenders for 150 branching system table telephones. Tenders by Dec. 1. Particulars may be obtained from the Postmasters-General at Sydney, Melbourne, Brisbane, and Adelaide.

Altrincham.—The Altrincham and Bowdon Administrative Sub-Committee for Education invite tenders for the electric wiring and fittings required for the Stamford Park new Council schools. Tenders to the Clerk by noon on Nov. 3.

Barrow-in-Furness.—The Corporation invites tenders for the supply and erection of a 500-kw. combined steam-engine and generator, balancer booster, switchboard, water-tube boiler, mechanical stoker, economiser, travelling crane, cooling tower, pipes, etc. Tenders by 12 noon on Nov. 13. See advertisement.

Clacton-on-Sea.—The Urban District Council invite tenders for the supply and erection of (Section A) gas-engines and dynamos; (B) switchboard; (C) underground mains; (D) accumulators; (E) meters; (F) crane; (G) buildings. Tenders to Mr. G. T. Lewis, clerk, by 3 p.m. on Nov. 6. See advertisement in last issue.

Spain.—The *Gaceta de Madrid* of Oct. 10 contains details of a concession for the construction of an electric tramway as an extension of that of the east of Madrid. Tenders must be sent in by Dec. 13 to the Director of Public Works, Madrid, in whose office particulars may be seen. A deposit of 1,899·95 pesetas, or about £60, is required to qualify any tender. Local representation is necessary. The same journal of Oct. 12 contains a notice of a concession granted to the Sociedad Los Tranvias de Zaragoza for the construction of an electric motor tramway in that city. The *Gacetas* may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

Netherlands.—The Board of Trade have been notified by the acting British consul at Amsterdam (Mr. F. A. Chambers) that the Zuid-Hollandsche Electrische Spoorweg-Maatschappij (South Holland Electric Railway Co.) will be prepared to receive tenders for the making of ground works, engineering, and additional works between the Ceintarbaan and "piket 120 by 70" (in connection with the works of Contract No. 14), the laying of rails and switches, and the supply and use of gravel ballast, as well as some works in connection with the railway, in accordance with Contract No. 17. The estimated cost of the work is 936,000fl. (£78 000). On Oct. 25, at 10.30 a.m., an explanation will be given, meeting place Café, "Plaats Lommerrijk," on the Bergweg, near Hillegersberg. Copies of the contract, with drawings, may be obtained from Messrs. Beversen and Van Hoorn Heerengracht, 38, The Hague, at a cost of 12·20fl. (£1. 0s. 4d.). Tenders should be written on stamped paper, and received before 1 15 p.m. on Nov. 2.

RESULTS OF TENDERS.

Southend.—The Town Council have accepted the tender of the Callender Co., at £25. 10s., for the supply of cable for repairing the overhead equipment.

Digitized by Google

Battersea.—The tender of West Bros., at £43. 15s. 6d., has been accepted for the supply of 10,000 tiles required in connection with the Nine Elms electric lighting scheme.

Kensington.—An order has been given to Henley's Telegraph Works for the supply of lead-covered cable at the price quoted by them—viz., £123 4s. 6d., less 2½ per cent.

Shoreditch.—The Borough Council have accepted the tender of Willans and Robinson, of Rugby, at £18,475, for two Willans-Parsons turbines with Siemens generators, together with condensers, etc.

Pontypridd.—The Electricity and Tramways Committee have decided to accept the tenders of the Brush Co., at £3,603, for the equipment of the tramway from Pontypridd to Hafod, and of Messrs. Henley, Birkenhead, at £2,585, for the laying of the cables.

Spain.—Messrs. Jackson and Phillips, Madrid, have contracted with the Compania minera industrial de Mancilla (Logrono) of Paris for power transmission scheme of 200 h.p. for a distance of 15 km. to the mines of this company. The contract includes the erection and equipment of an engine house, of 1,500 yards open channel, and 700 yards tunnel.

Great Western and Metropolitan Contract.—The contract for the equipment of the trains on the Hammersmith and City line of the Great Western and Metropolitan Companies has been awarded to the British Thomson-Houston Co. The contract is for 20 trains, the number of coaches per train being six. The equipment will consist of the B.T.H. type G.E. 76 motor and the Sprague-Thomson-Houston system of control.

Steam-Turbine Orders.—Messrs. Willans and Robinson, of Rugby, report the following contracts settled in favour of their steam-turbines: Four turbines of 1,000 kw. each for the Cleveland and Durham Power Co.'s new station at Middlesbrough; three turbines of 1,000 kw. each for Bruce Peebles' Durham scheme for supplying power to a number of collieries; two turbines of 1,000 kw. each for Bruce Peebles' Fife scheme; one turbine of 1,500 kw. for the Borough of Islington; one turbine of 1,000 kw. capacity for Drake and Gorham; and two turbines of 1,500 kw. capacity each for the Borough of Shoreditch.

Buralem.—The Markets Committee of the Corporation have received the following tenders for the lighting by arc lamps of the general markets:

Cross and Cross, Walsall	£82	0	0
E. M. Evans, Manchester	104	17	0
D. Wilson and Co., Huddersfield	133	13	6
Hooper, Neary, and Co., London	146	0	0
Wainford, Froggatt, and Francis, Stoke	152	0	0
Blackburn, Starling, and Co., Hanley	194	0	0

Engineer's estimate, £95. 10s.

London County Council.—The following tenders have been obtained in connection with the equipment of the through tramways route between the Strand and the Angel, Islington:

Supply of low-tension cables.

Callender's Cable and Construction Co., London	£4 025	4	4
British Insulated and Helsby Cables, Prescot	4 068	10	0
Siemens Bros. and Co., London	4,093	12	4
Anchor Cable Co., London	4,141	5	4

Note.—Although the amount of the lowest offer received for the cables was considerably in excess of the estimate therefor, owing principally to the increase in the market price of copper, the vice-chairman, in view of the great urgency of the work, authorised the acceptance of the tender.

Laying of cable-ducts.

J. A. Ewart, London (accepted)	£2,813	14	0
Reid Bros., London	2,974	8	0
British Insulated and Helsby Cables, Prescot	2 992	0	0
J. Mowlem and Co., London	4,435	0	0

The tender of Evered and Co., of Birmingham, at £275, has been accepted for the supply of switchgear for the sub-stations.

Paris.—The following results of the recent adjudication of Post Office tenders are available. Prices are per 100 km.: (1 and 2) 100,000 km. of 3mm. and 110,000 km. of 4mm. galvanised iron wire, Marcellot, Kurville (Haute-Marne), 304 50fr.; (3) 90,000 km. of 4mm. ditto, Forges tréfileries et pointeries de Oreil, 304fr.; (4) 100,000 km. of $^{11}/_{10}$ bronze wire, Cie des Tréfileries du Havre, 29, Rue de Londres, 309 50fr.; (5) 70,000 km. of $^{15}/_{10}$ ditto, Cie générale d'électricité 5, Rue Boudreau, 314fr.; (6) 60,000 km. of ditto, Cie générale d'électricité, 314fr.; (7) 95 000 km. of high-conductivity 4mm. copper wire, Forges de Franche-Comté, Besancon, 244 50fr.; (8) 80,000 km. ditto, Cie française des métaux, 242fr.; (9) 150 000 km. dicto, Mines et fonderies de Pontgibaud, 3 Rue des Mathurins, 242 75 fr.; (10) 95 000 km. of high-conductivity 3mm. copper wire, Sté d'electro-métallurgie de Dives, 241 40fr.; (11) 105 000 km. of 4mm. ditto, Cie des Tréfileries du Havre, 241 75fr.; (12) 105,000 km. ditto, Cie des Tréfileries du Havre, 240 75fr.; (13) 95 000 km. ditto, Grammont Pont-de-Chéroy (Isère), 243 50fr.; (14) 1,000 km. of 1mm. ordinary copper wire, Charpentier Page, Valdois (Haut-Rhin) 243 50fr.; (15) 80,000 km. of 2mm. bimetal wire, Cie française du bimétal, 194 50fr.; (16) 70 000 km. ditto, Sté d'électro-métallurgie de Dives, 11, Place de la Madeleine, 195fr.; (17) 7,000 km. of 3mm. ditto, Cie française des métaux, 10, Rue Volney, 192fr; (18) 19 km. of rubber-insulated, lead-covered, single-conductor telephone wire, type 88/1, Sté alsacienne de constructions mécaniques, Belfort, 390fr. per km.; (19) 40 km. ditto, two conductors, type 88/2, Sté industrielle des téléphones, 25, Rue du Quatre-Septembre, 815fr. per km.; (20) 20 km. ditto, three conductors, type 88/3, Geoffroy et Delore, Clichy, 3 700fr. per km.; (21) 30 km. ditto, De la Mathe, Saint-Maurice (Seine), 3 675fr. per km. All the contracts for telegraph and telephone accessories were let to French firms. The Colonial Office have accepted a tender for galvanised iron of the Forges de Franche-Comté as follows; for 100 km. of 2mm., 35fr.; 3mm., 34fr.; 5mm., 32 50fr.

BUSINESS NOTES.

TRACTION.

North-Eastern Railway.—It is reported that the North-Eastern Railway are about to electrify their system between Newcastle and Sunderland.

Southend.—The electrical engineer in his last return states that the traffic receipts for the past month had been £1,993, the rate per car mile being 13·97d.

Birkenhead.—At the next meeting of the Council a recommendation will be received from the Tramways Committee for a reduction of fares on two of the routes.

Ipswich.—At the borough police court last week James Miller was fined 20s. and costs for driving a cart in such a way as to obstruct the passage of an electric tramcar.

Bromley.—The Borough Council have decided by a large majority to seek statutory powers enabling them to undertake a service of motor omnibuses within the borough.

Rawtenstall.—At the last meeting of the Council the Mayor stated that there was no further information to be reported in reference to the tramways or electricity question.

Metropolitan District Railway.—The pneumatic Westinghouse system of signalling is being adopted by this company, and by the end of November will be completely installed.

Perth.—The new electric tramway system successfully went through the official Board of Trade inspection last week. The service is to be formally opened on Oct. 31 and for public traffic on Nov. 1.

Atterclife.—An old man was knocked down and run over by an electric tramcar when in the act of crossing the road on Wednesday week. At the inquest the jury returned a verdict of "Accidental death" and exonerated the driver from any blame.

Lucknow.—A license has been granted by the municipal authorities to the British Eastern Electric Power Co. sanctioning the construction of an electric tramway within the Lucknow Municipality. Particulars of the agreement will be found in another column.

Pontypridd.—Owing to their difficulty in getting a supply of local stone to complete the contract for laying the tramway within the stipulated time, the Council have agreed to grant the contractors, Messrs. Krauss and Co., an extension of six weeks.

South Lancashire Electric Traction Co.—It is reported that this company, which was in the hands of receivers, is about to acquire a new lease of life. Several large debenture holders have agreed to reorganise the concern and utilise its valuable properties.

Linlithgow.—At a meeting of the County Council held last Saturday it was reported that the National Electrical Construction Co. proposed to again ask authority to construct a tramway to Queens Ferry. The Council approved of a recommendation to oppose the application for compulsory powers.

Falkirk.—The electrification of the tramways is now completed, and the Board of Trade inspection of the route has taken place. The service has now been opened to the public, and, according to present arrangements, will be a five minutes' one, but in quiet times the cars will run less frequently.

Leith.—The section of electric tramways in Constitution-street and Bernard-street was inspected and approved of by the Board of Trade inspector last week. Until the Tramways Committee have a meeting to discuss the question of fares, there will be a penny fare from Bernard-street and Pilrig.

Poole.—The Council at a meeting last week decided to give their consent to the scheme for a light railway about to be promoted, the route to extend from the County Gates and running through Branksome Park and Sandbanks to Swanage. The Chamber of Commerce have given their support to the scheme.

Eastbourne.—The Motor Omnibus Committee recommend that, in view of the present small receipts on the Parade route, the service of motor 'buses be discontinued for the winter months. A total of 136,602 passengers had been carried on the 'buses during September, and the receipts amounted to £857. 0s. 7d.

Spain.—The Provincial Government of Navarro have given a concession for an electric tramway to Don Domingo Elizondo granting him the free use of the provincial highways and a subvention of 10,000 pesetas per kilometre, to be increased to 12,500 if he does not use the roads but only the bridges. The concessionaire has to pay to the Government half of his net profits after they exceed 6 per cent.

Grimsby.—The Town Council have approved a draft of an agreement to be entered into with the Great Central Railway Co. for the supply of electricity in bulk. The energy supplied will be charged for on the maximum demand system, a fixed charge being made of £4 per annum per kilowatt of maximum demand required at any one time, and, in addition, a charge of ¾d. per unit to be made for all current consumed.

Southsea.—A deputation waited upon the Council to urge the desirability of establishing a service of motor omnibuses to run through King's-road. The result was somewhat surprising, for a hint was dropped that it might be possible to institute a service of cars over asphalted roads which would not require the expense of a permanent iron way, but might be worked with a couple of overhead wires to carry the current.

Keighley.—At the October meeting of the Town Council the tramway statement which was presented showed that the receipts had been £4,648, and the expenditure £4,008, which left a balance of £640 on the working of the concern. After the payment of interest

Digitized by Google

and sinking fund charges, amounting to £2,352. 15s. 7d., there was a net deficiency of £1,612. 12s. 6d. on the year. The adoption of the accounts was moved and carried.

Horndean.—The light railway company have postponed their decision not to utilise the Corporation supply of electricity during the winter months. A special sub-committee of the Tramways Committee, at a meeting last week, considered the relationship between the Corporation undertaking and that of the company, and it was decided that if the company submitted a fair offer the question of purchase of the light railway would receive sympathetic consideration.

Weymouth.—The Trades and Labour Council, in a letter to the Corporation, urge their serious consideration of securing for the town powers to lay down and carry out a system of trams as recommended in scheme O by Prof. Kennedy, or in the event of their not doing so themselves to sublet these to a private company. It is stated that when the subject again engaged the attention of the Corporation the letter would be considered in conjunction with Prof. Kennedy's report.

Aberdare.—A London syndicate have asked the Council for their support in the promotion of a Tramways Bill in Parliament for Aberdare. They also stated that if such a Bill were carried and the Council found the money to construct the tramways, they would be prepared to lease the same. The Parliamentary Committee unanimously decided to have nothing further to do with the promotion of a tramways.

Durham.—At a meeting of the Rural District Council on Thursday week it was reported that a communication had been received from the Board of Trade stating that they had made an order sanctioning a further extension for six months of the period for completing the Durham and District Light Railways, but that the promoters had been informed that the Board would be unwilling to entertain any further application for an extension of time unless progress should have been made with the work.

Manchester.—We note that welded rail joints are to rule in Manchester. The system is being adopted along all new routes of the tramways, and less wear of the rails at the joints is anticipated in consequence. The electric tramcar building and repairing works erected recently by the Manchester Tramways Committee in Hyde-road were opened on Tuesday last by the Lord Mayor. The works, which cover about four acres of land, are said to have the most modern equipment of any in the country.

Dundee.—The recent *plébiscite* taken in connection with the running of Sunday cars has resulted in a large majority in favour of the Sunday service. Out of about 22 000 voters, 19,000 voted, and the majority amounted to over 4 000. The Tramways Committee have resolved upon an extension of the line to the eastern boundary at a cost of about £4,000. To carry out this work the Corporation is vested with statutory powers, the Act providing that operations must be completed by July 26 next year.

Haslingden.—The Town Council are preparing to promote an omnibus Bill in the next session of Parliament. Powers are sought principally for the reconstruction and electrification of the tramways and for the supply of electricity to the trams. It is proposed to get powers to extend the reconstructed system to Three Lane Ends, Helmshore, and Ewood Bridge, all within the Haslingden borough. The opportunity will be taken of obtaining powers for a number of improvements that are deemed necessary.

Tram Obstruction.—A carman was charged at Stratford on Tuesday last with causing an obstruction, by allowing his van to remain longer on the road than was necessary. He had been unloading furniture at a spot where the electric cars passed over a loop line, which was only 4ft. 10in. from the kerb, and a number of cars on either side of the van were obstructed for 50 minutes. The Bench dismissed the summons on the ground that defendant did not stop an unreasonable time, and that the inspectors should have been prepared for such an emergency.

Paddington.—At the last meeting of the Borough Council, relative to the London County Council's project of electric tramways along Edgware-road a letter was read from the Motor Omnibus Co. against the proposal, saying that they already carried 4,000,000 passengers, and were prepared to make their service more efficient Several deputations presented petitions in favour of the Council's scheme, and the General Purposes Committee of the St. Marylebone Borough Council advise assent to the scheme provided the borough has not to contribute towards the expense of road widening.

Ayr.—A copy of the tramways accounts presented to the Borough Council for the year ended May 15 has come to hand, from which we see the income totalled £15 082, being an average per car mile of 9 89d., while the expenditure reached a total of £8 033, averaging 5·27d. per car mile leaving a balance of £7,049. Out of this sum £2,267 has been utilised in payment of interest on capital, while renewals absorbed £250. The general manager reports that the overhead equipment is in good repair, whilst the track and permanent way have been well maintained. The cars are in good condition, though trouble is being experienced with the wheel flanges.

Liverpool —In acknowledging a vote of thanks for his services as chairman of the Tramways Committee, Sir Charles Petrie, at a meeting of that body last week, remarked that the concern had grown enormously since 1897. They were now carrying something like 2¼ million passengers every week, and the increase in the receipts during the past nine months, compared with the corresponding period of last year, was £7,500. He expressed a hope that there would be a continuity in the work of the committee, and that new members coming on to it would be guided by the experience of those who had served on it for some years. The vice-chairman, Alderman Smith, replying to a similar vote, took occasion to air his disagreement over the question of fares.

Aberdeen.—The Tramways Committee have decided that discount on celluloid tokens shall be discontinued from Nov. 1. Six more cars are to be fitted with covered tops, making 28 cars in all so equipped. These are considered sufficient to supply the wants on every route. At a meeting of the Council a letter was read from the secretary of the Aberdeen Suburban Tramways Co., stating that he was now authorised to make an offer in full of all claims in respect of the work done on the Deeside and Donside roads during the time the tramway rails were being laid, the sum mentioned to be in full settlement of all claims up to date, but not including a sum of £49 in respect of a new drain from the road at Pitfodels, the offer to remain open to Wednesday last. The terms were agreed to.

Tarporley.—On Thursday week Sir Herbert Jekyll, on behalf of the Board of Trade, heard the Cheshire County Council's objections to the confirmation of the order for the Tarporley light railway. The most important objection of the County Council was to the level crossing on the main road from Chester to Tarporley and to Manchester and Liverpool. On behalf of the promoters it was stated that the cost of the requirements of the Council would amount to about £6,000, and it would be a question whether the scheme would be proceeded with if they were compelled to find all the money. The present capital was small, and perhaps they might come to the Board along with the County Council and come to some agreement after discussing the matter privately, and the Board could then settle between them what should be done to safeguard the interests of the public.

Torquay.—The differences that have arisen between the contractors and the Corporation in connection with the construction of new tramways have been accentuated by the refusal of the mayor to call a town's meeting in compliance with an influentially-signed requisition. The requisitionists are arranging for a meeting on their own account. The Local Government Board inquiry into the application of the Council for sanction to borrow £9,500 for the extension and improvement of the present power station on Beacon Quay in order to enable the Corporation to carry out their agreement with the Dolter Co. to supply them with electric current for the working of the tramways will be held on Tuesday next. Notwithstanding the fact that the matter of paving has not yet been agreed to by the Board of Trade, the contractors commenced operations on Monday last in the presence of only one representative from the Council.

Belfast.—At a meeting of the Tramways and Electricity Committee the monthly accounts, amounting to £7,330 for the tramways department and £1,037 for the electric department, were presented and recommended for payment. The town clerk informed the committee that he had received the arbitrator's award charges amounting to £8,000, and these must be taxed by the taxing officer in London. The work of testing the new system on the Lisburn-road, the Malone-road, and the Stranmillis-road, which could not be performed earlier, as the contractors had not completed their arrangements, was carried out on Thursday week by means of one of the tramcars which have been converted from horse traction to electric traction. The car went over each of the three routes, the time occupied altogether being 1¼ hours. We understand that the result of the test was most satisfactory, though in one or two cases it is probable that alterations may be made in curves which are not considered as desirable as they might be. The car itself was found to work admirably, and to be quite as comfortable as any of the new cars supplied under the contract.

London County Council.—At the meeting of the London County Council held on Tuesday last a joint report of the Highways and Parliamentary Committee was presented, as a result of which it was resolved that a joint conference be held between the metropolitan borough councils and the London County Council to consider the question of supply of electric energy in London. The Highways Committee propose that a Bill should be promoted for the purchase by the Council at various dates of certain short lengths of tramways in or on the boundary of the county of London which are not included in the company's lease. The lines in question are those (*a*) from the Council's lines in Stamford Hill to the county boundary; (*b*) from Seven Sisters-road, *via* Green-lanes, to the county boundary near Hermitage-road; (*c*) from Green-lanes, *via* Seven Sisters-road, to the county boundary near Amhurst-park; and (*d*) in Seven Sisters-road, between Stroud Green-road and Green-lanes. The last named line was originally outside the county of London, but the county boundary has been altered, so that the down line of the tramways is now outside London, and the up line in London. The total length of line affected is about three miles of single track, of which about one-half mile of single track is in Hornsey. The agreement with the company for the purchase of its remaining interests in the Council's (northern) tramways has now been completed, but it will be necessary to obtain parliamentary confirmation of the subsidiary agreement.

Salford.—Some time ago the Tramways Committee of the Manchester and Salford Corporations agreed to a scheme whereby a service of tramcars should be run into Trafford Park, so that passengers could be conveyed to the large works there. This has involved the solving of a very difficult problem, inasmuch as the Ship Canal has to be crossed, and the bridge over it swings open to allow of the passage of ships. To enter the park from Salford the tramcars will have to cross this bridge, and its equipment for tramway purposes has added another to the many interesting engineering feats in connection with the waterway. The tramway wires and other necessities have had to be erected in such a manner as not to interfere with the working of the bridge, but this has been successfully accomplished, and very little work now remains to be done in connection with the scheme. In the hope of preventing any mishaps, signals have been erected 150 yards away on each side of the bridge, and when the huge structure is closed these signals will be placed at "danger." As a further safeguard in case the signal should not be seen or be disregarded by the motorman, "points" have been placed on the metals some distance from the bridge. These will be worked electrically by a canal official, who, at the same time that he opens the bridge, will put up the danger signal and close the

Digitized by Google

points. The closing of the points will mean that the car is carried off the usual track, so that the danger of a vehicle crashing into the gates which are thrown across the roadway when the bridge is open will be almost entirely removed.

Cleethorpes.—At a meeting of the Urban District Council the following report was presented by the Electrical Sub-Committee with reference to the tramways question: Owing to the tramways company failing to arrange terms with the Grimsby Corporation with respect to their proposed extensions, the Bill which was to have been promoted, and in which the committee was depending on having an agreement inserted, was allowed to drop as impracticable. On Oct. 5 the clerk, along with Mr. Councillor Brockway, had a long interview with Mr. Lees (Lees and Butterworth), and explained the position of the Council. A long consultation subsequently took place between Mr. Lees, Mr. Chapman, Mr. Wintringham, and Mr. Vesey Brown. In the event of an amended order having to be applied for, it was decided to visit the Board of Trade with the intention of getting power in the amended order to lease part of the undertaking, but Mr. Collins, the official in charge, would not give an opinion without first consulting the solicitor to the Crown. After a lengthy discussion it was eventually agreed that the better course would be to defer the completion of the purchase until July 3. 1910, the tramways company agreeing to accept the sum of £15 400, instead of £17 000, the present purchase price. Also, if the Council desired to then defer the completion until July 3, 1912 they would allow a further sum of £640 for depreciation. The tramways company also consented to recoup the Council for out-of-pocket expenses incurred in procuring the loan to the amount of £100, to be paid on the signing of the agreement. The sub-committee recommended that the arrangement be embodied in an agreement to be prepared by Messrs. Ashurst, Morris, Crisp, and Co., and that it be subject to the confirmation of the Council. The committee approved of the action taken and the arrangements made by the sub-committee.

Edinburgh.—A sheriff's inquiry was recently held concerning the accident which occurred at the Lady Victoria Pit, resulting in the death of a young man by electrocution. The jury found that the man met his death by coming in contact with an electric wire. With regard to the proposed tramway extensions, a report has been issued by Prof. Kennedy. He is of the opinion that the expense of laying down the conduit system along the route from Gilmore-place to Colinton, a portion of which is now worked by horse cars, was out of the question. Even if the traffic justified such an expense, it would probably be better to extend the cable lines than to introduce an entirely different system of equal cost for short distances. It had been suggested that these outlying lines should be worked by tramcars, each carrying its own petroleum motor, the cars running along the ordinary lines. There was no trustworthy experience of information as yet as to the cost of running or of maintaining such cars, and the travelling in them would be much less comfortable than the travelling in ordinary tramcars. He, therefore, thinks their choice practically lies between extensions by means of overhead lines or by some surface-contact system. Of the Dolter and the Lorain systems, the latter had certainly had far the larger amount of practical use. The former had had sufficient use to enable him to form the opinion that it had been brought into practical working condition. He believes that with proper care either of the two systems might be used on the Gilmore-place line. He is not prepared to say positively that either of the two systems was better than the other on the whole. A comparison between the two was a very complicated affair. At present he would only suggest, further, that it might be advisable to ask both the Lorain and the Dolter Companies to supply them with three or four "dummy" studs, which they might put down at their proper intended level between the rails, so as to find out by practical trial whether their shape or elevation above the general road level caused any practical inconvenience.

Leeds.—A few years ago the Horsforth District Council handed their provisional order for tramways over to the Leeds Corporation, who later obtained powers to construct the necessary lines. The extensions are making much progress, and the main track, from Kirkstall Abbey to Calverley-lane End, Horsforth, has been completed, operations having been started in the autumn of 1904 with the direct object of finding work for the unemployed, but the running of cars thereon forms part of a scheme which was definitely adopted in 1904—viz., to early extend the city tramways to Rodley, and in course of time to outside places, if desired. Such a policy involved the consideration of what method of generation and distribution should be employed. The present low-tension system is not economical when power is carried beyond a distance of 3½ or four miles from the generating station, and, therefore, it was decided to introduce the high-tension alternate current. In accordance with this decision, arrangements were made for extending the power station in the Calls, and for the installation of generating plant but there have been unforeseen difficulties arising from the close proximity of the power station to the river. These difficulties have now been overcome, and the work is being carried forward as rapidly as possible. Still it is very doubtful whether the plant, which includes a couple of turbines of the Curtis vertical type, will be ready before the end of the present year. The use of turbines for generating electric current for traction purposes alone is one of the very latest of engineering devices. It is said that, so far as this country is concerned, they are only thus employed in a few instances in London, though both the Yorkshire and Lancashire Electric Power Companies have utilised them at their generating stations for the combined purposes of lighting and power. In Leeds the current will be generated at 6 500 volts three-phase, and will be distributed from the central station in the Calls to two sub-stations which are being erected—one at Bramley Town End, and the other at Hawksworth, Kirkstall. At these points there will be transformers which will change the current to the potential required for use by the cars.

LIGHTING AND GENERAL.

Briton Ferry.—The Council propose putting down the town installation during the next few months.

Bray.—The cripples' home is being wired for 70 lights, which necessitates the laying of a cable at a cost of £31.

Paris.—The Government have approved of thoroughly modernising the Paris telephone system at a cost of £400,000.

Horsforth.—We understand that the Urban District Council are about to transfer their electric lighting order to the Yorkshire Electric Power Co.

Manchester.—An inquiry will be held to-day into the Town Council's application for sanction to borrow £60,000 for electricity extensions.

Edison and Swan United Electric Light Co.—The dividend warrants in respect of the dividend declared by this company at the meeting on the 12th inst. will be paid on Thursday, Dec. 1.

Malvern.—Electricity is to be installed at Malvern Priory Church for lighting and organ blowing. A committee, consisting of the clergy and churchwardens, has been appointed to carry out the schemes.

South London Electric Supply Co.—The company announces that the sales of current for the quarter ended Michaelmas last amount to £17,577, against £16,755 for the corresponding quarter of last year.

Pitlochry and Dunkeld.—The Lords Commissioners of the Treasury have now authorised the establishment of telephone exchanges at Dunkeld and Pitlochry, and their connection with the trunk system of the country.

Liverpool.—The Electric Power and Lighting Committee have recorded a vote of thanks to Councillor Max Muspratt, deputy-chairman of the Electric Power and Lighting Committee of the Liverpool Corporation, for his services during the past year.

Aberdeen.—During September the output of the electrical station at Ferryhill was 367,455 Board of Trade units, of which 178 274 units were for lighting, and 189,181 units for traction purposes. It has been agreed to extend the electric cables in King-street and mains in the Rosemount district.

Liversedge.—The District Council at their last meeting discussed a resolution authorising the clerk to borrow the sum of £1,500 for the purposes of electrical supply (by arrangement with the Yorkshire Power Co.). Eventually the question was referred back to the committee for report.

Court of Common Council.—An application from the Charing Cross, West-end, and City Electricity Supply Corporation for the consent of the Corporation to change the pressure from 100 to 200 volts in those parts of the western area where a supply of 100 volts has been given has been agreed to.

Stirling.—Mr. Hanson, the electrical engineer, in his last report, states that for the four weeks ending Sept. 30 19,534 units were generated at the power station, as compared with 17 319 for the same period of 1904. The total number of connections was 18,116 8-c.p. lamps, as against 16,070 at the same period last year.

Folkestone.—The electricity supply company having invited their customers to pay a visit to the Electrical Exhibition at Olympia, Addison-road, arranged with the railway company to run a cheap excursion train to London last week. A train composed of absolutely new second-class saloon carriages was used and duly appreciated.

Laminated Leather Belting.—We have received a catalogue issued by Mr. James Hendry, 252, Main-street, Bridgtown, Glasgow, which contain illustrations and price list of his patent leather belting. The belts can be made any length free from splicings, run perfectly noiseless, straight and true, and are of a uniform thickness throughout.

Irvine.—At last week's Town Council meeting considerable discussion arose upon a motion to the effect that a report approving of the acceptance of the offer of Messrs. Mercy and Marr to carry out an electric lighting installation for part of the town at a cost of £6,600 be accepted. Several amendments found no seconder, and nothing was done.

Newport.—It is reported that the price for electric lighting is to be reduced by 1½d. per unit—that is to say, from a maximum of 5½d. to 4d., and a minimum of 3d. per unit. A reduction will also be made in the supply of current for heating and cooking. The Electricity Committee have decided to promote a large exhibition of electrical appliances.

Partnership.—Mr. Robert MacGregor, for many years a partner in the firm of Messrs. W. Dunn and Co., Durban, Natal, has been admitted a partner in Rowland Carr and Co. We are informed that Mr. J. C. Brown, who is so well known amongst electrical engineers throughout the kingdom, will now devote the whole of his attention to outside work.

Torquay.—An enquiry will be held next Tuesday into the application of the Town Council for sanction to a loan of £9 500 for the extension and improvement of the present electric lighting and power station on Beacon Quay, in order to enable the Corporation to carry out their agreement with the Dolter Co. to supply them with the electric current for the working of the tramways.

Electric Furnace.—Messrs. Marryat and Place have been instructed to supply to the University of Glasgow a duplicate of the 1,000-ampere Moissan furnace they have been showing in operation at Olympia. During the last week of the exhibition the diamond obtained from carbon dissolved in iron was on view. The microscopic output consisted of about 50 diamonds, which were mounted upon one slide. Enlarged 40 times the structure could be clearly seen.

Football.—The annual match between the Robertson Electric Lamp Works and the General Electric Co., London, took place on Saturday last at the Lamp Makers' ground at Twyford-avenue, Acton, and after an enjoyable game the Lamp Makers ran out the winners by seven to

Digitized by Google

one The Lamp Makers have started their second season well, having won both their league matches, and it is hoped they will win another at the expense of Wigmore United on Saturday next.

Hull.—The Stoneferry Bridge, which spans the River Hull about two miles from the Humber, was formally opened on Monday by the mayoress. It is a steel swingbridge, constructed in two spans (a movable span of 150ft., giving a clear opening to river traffic of 61ft., and a fixed span of 26ft.), and it is worked by electric power from the Corporation mains. The structure, which was designed by Mr. White, the city engineer, with approaches, has cost over £20,000.

Luton.—The electrical engineer in his last report states that since Sept. 8 46,537 units have been generated and an equivalent of 580 8 c.p. lamps and one motor of 5 h.p. connected, making a total of 275 consumers with 16 306 lamps and 105 motors of 517½ h.p. The number of units generated shows an increase of 132 per cent. over the number generated during the corresponding period of last year. Applications had been received for over 800 additional lamps and 117 h.p. in motors.

Edinburgh.—The Electric Lighting Committee have been discussing the question and cost of lighting common stairs with electricity, and will recommend that the proposal of the Cleaning and Lighting Committee to light such districts as the stairs in the Canongate and Cowgate could not be entertained, but that in future the Electric Lighting Committee would be prepared to do stair lighting in districts where the wires were already in houses for private use at the rate of £1 per 5 c.p. lamp.

Rubber.—A dispatch has been received at the Foreign Office from H.M. Minister and Consul-General at Adis Ababa (Sir J.L. Harrington, K.C.V.O., C.B.), stating that a London company have been granted by the Emperor Menelik a concession of the right to gather and export rubber from the present known rubber-bearing districts of Abyssinia, for a period of 10 years on payment of a royalty. Sir J. L. Harrington remarks that this concession should have the effect of increasing trade between Abyssinia and the Soudan by way of the Sobat River.

Birstall.—An enquiry has been held into the application of the District Council for powers to borrow £2,000 for electricity purposes. It is proposed to take current in bulk from the Yorkshire Electric Power Co., at the price of 3d. per unit for the first 1½ hours of each day or night, and 9d. for all current afterwards. Mr. J. E. Ellis, electrical engineer to the Morley Corporation, submitted a statement showing that, upon an estimated consumption of 30,000 units in the first complete year, and 40,000 in the second year, at 4d. per unit for lighting purposes, there would remain a profit of £75 and £158 for the respective years.

Huddersfield.—The Electricity Committee have recommended the supply of energy for power purposes, and the chairman (Councillor Chatterton) and the engineer will shortly submit a draft scale of charges and conditions on the lines of the discussion at the meeting. The engineer's last report shows that there were 2,159 consumers in September, this being an increase of 17 over the previous month, and 148 168 lamps were connected, or an increase of 733 over the previous month. Application has been made to the Board of Trade for sanction to the erection of an overhead line from Golcar to Crimble.

Finchley.—We understand that last week's fire at the electric light works, Squire's-lane, caused damage to the extent of about £2 000, but that the generating rooms escaped with but comparatively little damage. The cause of the outbreak is unknown. It occurred in the clerical department, after office hours. The roof of the offices was completely burned away, only the four walls of the block being left. The battery was slightly damaged. Expensive testing instruments and laboratory appliances, irretrievably ruined, form no small part of the total damage. The most important of all documents were kept in a strong room, and when it was opened on Wednesday afternoon it was found that not a single paper or book had so much as been scorched.

Brighton.—At the last Council meeting the proceedings of the Lighting Committee, containing the following, were approved: "A letter was read from the engineer recommending that no alteration be made in the existing tariff for a supply of electricity to consumers beyond the borough boundary. It was resolved that the charge for electricity supplied to private consumers outside the borough for the ensuing year should be the same as at present—viz., 7d. per unit for 400 hours' use of the maximum demand per annum, and 1d. per unit afterwards." Nearly 100 members of the committees of the Brighton Ratepayers' Associations, under the leadership of Alderman Carden, paid a visit to the electric lighting works at Southwick on Saturday.

Macclesfield County Asylum Lighting.—The electric lighting of the new infirmary annexe at the above has now been completed, consisting of three steam dynamos, switchboard, wiring, and all necessary gear, etc. The whole of this installation has been carried out according to the engineers' specifications, and a feature of the work is that this has been done at a saving of about 2 per cent. less than the accepted tenders. The contractors for the wiring, fittings, and public lighting are Messrs. D. Firth and Son, of Manchester, and for the plant Messrs. J. H. Holmes and Co. The consulting engineers are Messrs. Lacey, Sillar, and Leigh, of Westminster, and King street, Manchester, who have worked in conjunction with the county architect of Chester, Mr. H. Beswick.

London Gazette.—The Wembly Urban District Council have decided to apply for an electric lighting provisional order. The partnership between Edwin Lansing and Thomas Frederick Griggs, carrying on business as electricians and electrical engineers at 19, Victoria-buildings and Golden Gate Works, Old Trafford, Manchester, has been dissolved by mutual consent. The first meeting in the estate of Thomas Hill, electrical engineer, 24, Vicarage-road, Wolverhampton, will be held at the Official Receiver's Office, Wolverhampton, on Nov. 7, at 11 a.m. Thomas Leman, St. Peter's Churchwalk, Nottingham, has been appointed trustee in the estate of George Robson and John Samson Robson, electrical engineers, Empire-buildings, Newgate-street, Newcastle-on-Tyne.

London County Council.—On Tuesday it was agreed to lend the Stepney Borough Council £3 770 for electric lighting, and the Woolwich Borough Council £5,111 for electric lighting and street-lighting. The Highways Committee's recommendation that expenditure on capital account not exceeding £5 300 be sanctioned for the provision of additional high-tension feeder cables for the Elephant and Castle tramways sub-station, and that the committee be authorised to make arrangements for the supply of the cables was approved. The Highways and Parliamentary Committee were authorised to make arrangements for a conference with representatives of the City Corporation, the Council of the city of Westminster, and the metropolitan borough councils to consider the question of the supply of electrical energy in London. They were also empowered to arrange conferences with the companies supplying electricity.

Keighley.—A recent report on the electricity undertaking prepared by Mr. J. M. Smith shows a total expenditure of £51,064. The receipts have increased from £2 102 for the year 1902-3 to £4,723 for the year ended June 30 last, and the gross profit from £168 to £1,500. Against this gross profit there is to be set £2 512 paid in interest and sinking fund and other charges, making the deficit for the year £1,012, to which has to be added a deficit of £267 brought forward from last year's net revenue account. To meet this charge the estimates had provided for the appropriation from the rates of £1,752, which left a balance of £472 towards meeting next year's loss. The number of units sold for private lighting and motive power have increased in three years from 98 345 to 197,093, while last year the tramways had also taken 160 498 units. The number of consumers during the year 1902-3 was 133, last year they numbered 227.

Watford.—The number of consumers connected to date is 432. It has been agreed to supply Messrs. G. W. Jones, Limited, printing works on the following terms: 1d. per unit, all plant to be electrically driven, contract to be for five years, minimum amount to be consumed to be £400 per annum after first twelve months' working, lighting other than by arc lamp not to exceed 20 per cent. of the whole. The following resolution has been passed and will be sent to the Local Government Board: "That, in the opinion of this Council, it is highly desirable that the various officers of the Council should be enabled to attend such conferences as pertain to their respective departments, as much valuable information is to be obtained thereby, and that representations be made to the Local Government Board of the importance of local authorities being enabled to send delegates to such conferences, and to endeavour to induce the Board to allow the expenses of delegates attending the conferences of the association, in the same way as are the expenses of delegates attending the Urban District Councils' Association."

Stock Exchange.—The Stock Exchange Committee have ordered the undermentioned securities to be quoted in the official list: County of Durham Electrical Power Distribution Co.'s 20,000 5 per cent. preference shares of £5 each, fully paid, Nos. 1 to 20,000; Lisbon Electric Tramways' 500,000 ordinary shares of £1 each, fully paid, Nos. 1 to 500,000; 425 553 6 per cent cumulative preference shares of £1 each, fully paid, Nos 1 to 425,553; and £500 000 5 per cent. mortgage debentures of £100 each Nos. 1 to 5,000 (registered); Montreal Light, Heat, and Power Co.'s 170,000 shares of 100 fol. each, fully paid, of the capital stock (Montreal certificates). The committee have been asked to appoint a special settling day in Johnson and Phillips's 6,635 ordinary shares of £1 each, fully paid, Nos. 1 to 6,635, and £116,667 5 per cent. first mortgage debenture stock. And to allow the following securities to be quoted in the official list: Newcastle and District Electric Lighting Co.'s 20,000 shares of £10 each, £9 paid, and 10,000 shares of £10 each, £5 paid; Oriental Telephone and Electric Co.'s £100,000 4 per cent. redeemable debenture stock.

Electric Share Market.—The *Financial Times* says the electric share market has maintained a firm tone during the past week, and business has been on a very fair scale. In the supply section Charing Cross ordinary have further risen ¼ to 7⅞, but City of London preference have fallen ¼ to 15⅞. County of Londons have advanced ⅜ to 10½, and the preference have gained ⅛ at 12⅞. Chelsea debentures at 110½ are ½ higher, and the ordinary have hardened ⅛ to 6, but Metropolitans have fallen ⅜ to 10¼, Westminsters ¼ to 12⅜, Smithfield Markets ⅜ to 2¼, Oxfords ⅛ to 6⅛, and Edmundsons ⅛ to 5⅞. Manufacturing descriptions have met with little attention, and the only movement is in Telegraph Constructions, which have fallen ½ to 34½. Among traction issues the recovery in British Electrics has made further progress, and the ordinary have risen ⅜ to 9⅞, while the preference have gained ¼ at 11¼. Bath Electric Trams debentures have risen 1 to 103, but London United Trams debentures have fallen 1 to 101. Anglo-Argentine Trams have gained ⅛ at 8½, and Buenos Ayres and Belgranos have also put on ⅛ at 3⅞. Cape Trams, however, have relapsed 1/16 to 1⅛ on the proposal to issue fresh debentures, and Calcutta Trams have declined ⅛ to 9⅜.

Southend.—The electrical engineer has been authorised to purchase a wattmeter, at a cost of £17, for registering electrical energy used in conjunction with the tramway cars. The main in Victoria-avenue is to be extended northwards. The electrical engineer in his last report states that during the last month mains have been extended in Victoria-avenue and Baxter-avenue, and five additional Nernst lamps erected on the Beach Estate. Forty-eight consumers have been connected, with an equivalent of 1,484 8 c.p. lamps. One consumer with 20 lamps has been disconnected. There are now 955 consumers with an equivalent of 56,496 8 c.p. lamps; 231 of those, with an equivalent of 9,614 lamps, have been connected during the six months ended Sept. 30. The armature of No. 2 machine at the generating station broke down on Sept. 18 owing to three bad connections in the armature winding; the same trouble, due to faulty workmanship

Digitized by Google

having occurred before. The number of units generated for lighting during the month was 91,035, as against 64,690 for the same month last year—an increase of 41 per cent.—and the number of units for traction was 48,507, as against 48,086—an increase of 0·87 per cent.

Bath.—With regard to the recent inquiry into the application of the Town Council for sanction to the borrowing of the sum of £19 000 for purposes of electric lighting, the Local Government Board have decided to comply with the application so far as it relates to the borrowing of the sums of £17,120 and £1 000, the latter sum in respect of meters. In arriving at the sum of £17,120, the Board have deducted the following items of excess expenditure which they do not regard as being suitable subjects for a loan—viz: temporary works in fixing boilers, £36. 17s. 1d.; temporary erection of boilers, £505. 13s.; spare boiler tubes, £7. 16s.; spare valves and springs, £16. 2s.; spare armatures, £117. 5s.; spare brushes, £2. 0s. 11d.; temporary works on switchboard, £49 2s. 8d.; hand tools, £41. 9s. 4d.; timber, £21. 9s. 4d.—total, £797. 15s. 4d. A further deduction of £2 has been made on account of the excess expenditure on the steam and exhaust piping, and condensing plant having been incorrectly stated. The Board have also, in accordance with the usual practice, deducted a sum of £80 in respect of the debt outstanding on works which will be superseded in connection with the proposed alteration of the position of the present water-softening plant. The Board consider it very unsatisfactory that the estimate on which they sanctioned the loan of £30,000 should have been so largely exceeded.

Shoreditch.—At the last meeting of the Borough Council the Lighting Committee reported that in connection with the estimate approved by the Council on Jan. 17, 1905, they had considered the tenders for the supply and erection of two steam turbo-generators, etc., which were referred to them by the Council on July 18. Tender forms and specifications were applied for by 14 firms, of which one returned the documents at once as being unable to tender. Tenders were received from 11 firms, comprising 23 offers. These were carefully examined by the borough electrical engineer, and the committee, before coming to a final decision, reduced the tendering firms to three, with five offers. The committee gave the most serious consideration to these offers and the report of the borough electrical engineer, and having had an opportunity of seeing similar plant running under working conditions, they were of opinion that Messrs. Willans and Robinson's offer of Willans-Parsons turbines with Siemens generators was the most advantageous to the Council. The price was £18 475, the lowest for this combination, although not so low as other tenders for other combinations. The committee, therefore, recommended that the tender of Messrs. Willans and Robinson, of Rugby, for two of their Willans-Parsons turbines with Siemens generators, together with condensers, etc., for £18,475, be accepted, the firm agreeing to put in the necessary foundations and floor, and subject to the necessary contract being entered into. The report was, after some discussion, adopted. At the same meeting, Mr. Hall, in answer to questions by Messrs. Read and Edmunds, said the Lighting Committee were considering the tenders for bulk supply from the various surrounding authorities. They were of a very complicated character, and required a great deal of consideration, and he asked the Council to bear with the committee, and give them time to make a complete report.

Oxford.—The Electricity Committee reported at the last meeting of the City Council that in order to meet the continuously-growing demand, and to have an adequate margin of generating plant, an additional 200-kw. set of the most modern design has been installed at Osney works, and the steam capacity of the plant has been increased by an additional quick-steaming boiler, fitted with a superheater, which is calculated to produce steam with the lowest possible coal expenditure. An addition has been made to the main switchboard to control the new sub-stations that have been added, and the extensions of machinery in the remaining sub-stations. The central distributing station at Ship-street has been removed to a building specially designed for the purpose, at the rear of 23, Cornmarket street. An additional sub-station has been erected for the supply of the east of Oxford, in Union-street, Cowley-road. It is anticipated that in the course of a few days this sub-station will be in full operation. Additions have been made to the sub-station in the police passage, and are also in course of progress at the North-parade station. At the latter station a storage battery will be erected in order to more effectively regulate the pressure in the North Oxford district. The whole of the sub-stations have been overhauled, and are now entirely fireproof. The high-pressure mains feeding the sub-stations have been largely increased in capacity, and have been increased to an extent which it is calculated will meet the ultimate demand of the city both for lighting and the supply of motive power, either for traction or any other purpose. The low-tension mains of the company have been extended in Cowley-road, and the whole length of Iffley-road; also in many of the roads adjoining the Banbury and Woodstock roads. The use of the light has been largely extended in the University buildings, the Radcliffe Camera and the Indian Institute having been installed, while additions have been made at Merton and other colleges, and also at the University Museum. The demand for the light in the business and residential districts of the city continues to increase rapidly, and it is estimated that the number of lights added during the year will be above the average of former years.

Edinburgh.—The Electric Lighting Committee have adopted a report by Sir Alexander Kennedy upon the condensation of steam at the Dewar-place and M'Donald-road stations, suggesting that for Dewar-place station water could be obtained from the canal at Port Hopetoun, led into the works by pipes, and allowed to play on the steam-pipes, thereby condensing the steam into water, which would be again available for the boilers. The canal water could be let out again into the canal at Port Hamilton. For M'Donald-road station water could be drawn from and returned after use to the Water of Leith. In giving comparative statistics showing the increase of the electric light undertaking during the last 10 years, Mr. Alex. Stevenson, convener Electric Lighting Committee, Edinburgh Corporation, points out that in 1896 there was a revenue of £15,762 from 452 consumers, who brought 883,335 units. The Council now own two stations with a total capacity of 7,280 b.p. and 12 000 b.p. respectively. The output from the first was eight million units last year, while four millions were generated in the other, and during 1905 8,334 consumers paid £118,953 for 11 648,501 units. The aggregate of the capital expenditure up till May 15 last was £905,000. There is a reserve fund of £78,000. In each of the last three years about £28,000 was contributed to the sinking fund. In 1895 the cost for arc street-lighting was £20 per lamp. This expenditure has been gradually decreasing, and the Council have recently authorised the installation of 50 arc lamps of a new type at £9. 10s. per lamp. During the last five months the demand for current shows the same steady progress as in former years, supply having been applied for equal to 27,651 8-c.p. lamps. Mr. Stevenson concludes as follows: "The success of the undertaking is, no doubt, largely due to the fact that in Sir Alexander B. W. Kennedy and Mr. F. A. Newington, the consulting and resident engineers respectively, we have two men of outstanding ability at the head of affairs. The Council was also very happy in the choice of ex-Bailie Mackenzie as the first convener of the Electric Lighting Committee, for he devoted himself to the work in a manner which merited and received the admiration of his colleagues."

King's Norton.—At the last meeting of the King's Norton and Northfield Urban District Council, Mr. W. H. Davison presented the report of the Electric Lighting Committee, which stated that the Board of Trade were now prepared to consent to the proposed transfer by the Council of certain of their powers under the King's Norton Electric Lighting Order, 1898, to Callender's Cable and Construction Co., Bellias and Morcom, and the Electric Construction Co. The Local Government Board would be prepared to consider applications from the Council for sanction to loans in the matter, subject to the consent of the Board of Trade being obtained to the transfer, to the terms of the agreement being such as the Local Government Board considered satisfactory, and to the financial position of the Urban District Council interposing no obstacle. It had been ascertained that in order to establish a complete scheme of electric lighting within the district the original estimate of £35,000, made some years ago, would prove inadequate, and at a conference with the three companies an initial outlay of £50 000 was suggested. The committee understood that as the demand for current increased it might be necessary, by reason of extensions to plants, mains, etc., to increase the capital outlay to an approximate sum of £100,000. The committee recommended that they be authorised and empowered to continue the negotiations with the three companies above mentioned, and to settle with them the terms of the agreements to be entered into by the Council with the proposed new company: (*a*) for the construction and erection of the works, plant, and accessories for the purpose of providing the necessary works within the district; and (*b*) for the transfer (when the works were completed) of the powers and obligations of the Council, under the Electric Lighting Order, 1898, for a period of 21 or 25 years as might be agreed, and providing, *inter alia*, an option for the Council to take over the undertaking after the expiration of 10 years without any premium or compensation, or at any other period upon terms to be agreed, the above agreements being made subject to and conditional upon the sanction of the Local Government Board, the Board of Trade, and any other authority whose sanction or consent might be necessary. The report was adopted.

PROVISIONAL PATENTS, 1905.

OCT. 16.

20893. Improvements in holders for incandescent electric lamps and other electric fittings. John James Brooke, 6, Bank-street, Manchester.

20898. Improvements relating to electrolytic apparatus. Claus Nissen Rüber, 7, Southampton-buildings, London. (Date applied for under Patents Act, 1901, Oct. 15, 1904, being date of application in Norway.) (Complete specification.)

20950. Improvements in controlling devices for electric motors applicable to the motors of elevators and the like. Otis Elevator Company, Limited, 55, Chancery-lane, London. (Otis Elevator Company, United States.) (Complete specification.)

20951. Improvements in electric elevator control systems. Otis Elevator Company, Limited, 55, Chancery-lane, London. (Otis Elevator Company, United States.) (Complete specification.)

20960. Improved non-reversing two-way running trolley pole for electrical traction. Hilary Quertier, 53, Chancery-lane, London. (Complete specification.)

20989. Improvements in machines for making incandescent lamps. Peter Banta, 83, Cannon-street, London. (Date applied for under Patents Act, 1901, Oct. 14, 1904, being date of application in United States. (Complete specification.)

20990. Improvements in and relating to dynamo-electric machines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

OCT. 17.

20995. Improvements in vessels for containing fused salts during electrolysis. Sherard Cowper Coles, Grosvenor-mansions, Victoria-street, Westminster, London.

Digitized by Google

21020. Improvements relating to rotary-current interrupters. John Otto Heinze, jun., 7, Southampton-buildings, London. (Complete specification.)

21034. Single-phase alternating-current motor with commutating poles. Englebert Arnold and Jens Lassen la Cour, 34, Castle-street, Liverpool. (Date applied for under Patents Act, 1901, Oct. 17, 1904, being date of application in Germany.) (Complete specification.)

21038. Improvements in or relating to the electrical transmission of power on motor vehicles and boats. Herbert McNulta, 57, Barton-arcade, Manchester. (Date applied for under Patents Act, 1901, Dec. 10, 1904, being date of application in United States.) (Complete specification.)

21064. Improvements in and relating to alternating-current electric motors. The British Thomson-Houston Company, Limited, Hans Sigismund Meyer, and Paul Alphonse Mossay, 83, Cannon-street, London.

21068. Improvements in apparatus for controlling electrically-propelled trains. Siemens Bros. and Co., Limited, and Francis Lydall, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

21070. Improvements in connection with polyphase alternate-current electric commutator machines. Elektrizitäts-Aktien-Gesellschaft vorm. W. Lahmeyer und Co., 47 Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, Oct. 17, 1904, being date of application in Germany.) (Complete specification.)

21071. Improvements in and relating to conduits or casings for electric conductors. Richard Henry White Knight and Ludwig Nagel, 323, High Holborn, London.

21095. Method for the production of hollow poles of concrete with a metal insertion forming an interconnected framework for electric conductors and the like. Hans Aebi, 31, Bedford-street, Strand, London. (Date applied for under Patents Act, 1901, Nov. 21, 1904, being date of application in Germany.) (Complete specification.),

Oct. 18.

21108. Improved non-slipping device for locomotive, steam and electric traction engines. Alexander Marr and Thomas Chalmers, 179, Maraland-road, Brooklands, Cheshire.

21145. Improvements in and relating to methods of collecting and conveying electric currents. Siegfried von Ammon, Oswaldestre House, Norfolk-street, Strand, London.

21162. Telephone receivers and the like. Rod B. Bumiller, 8, Quality-court, London. (Complete specification.)

21173. Improvements in installations for electrically igniting the charges of internal-combustion engines. Arthur Harold Nicholson, Birkbeck Bank-chambers, Chancery-lane, London. (Complete specification.)

21181. Improvements relating to electrical measuring instruments. Thomas Wilcock Varley 7, Southampton-buildings, London. (Complete specification.)

21198. Improvements in or connected with the pole-pieces of dynamo-electric machines. John Herbert St. Hill Mawdsley and John Wesley Burley, Norfolk House, Norfolk-street, Strand, London.

Oct. 19.

21202. Improvements in electric light fittings. Veritys Limited and Frederick William Thorpe, Plume-street, Aston, Birmingham. (Complete specification.)

21204. Improvements in apparatus for moving electrically the points on electric tramways and railways. Joseph Patrick Tierney and John Malone, 44, Booterstown-avenue, Booterstown, county Dublin.

21223. Improvements in electric step motions. Arthur George Brown, Arthur Whitten Brown, and Edward Claire Whelan, 17, St. Ann's-square, Manchester.

21224. Improvements in conduits for electric cables and the like. The Simplex Steel Conduit Company, Limited, Frederick Huggins, and Laurence Maxwell Waterhouse 34, Castle-street, Liverpool.

21228. Improved form of high-tension distributer. Sidney Adolph Horstmann, 13, Union-street, Bath.

21243. A new or improved composition particularly adapted for purposes when insulation is required. Caesar Marter, c/o. J. W. Stocker, 150 Fenchurch-street, London.

21248. An electric machine for use in automobiles and for other purposes. Jean Antoine Edouard Pellorce, 115, Cannon-street, London.

21253. Improvements in dynamometric governors. Joseph Ord Richardson, 46, Lincoln's-inn-fields, London.

21261. Improved arc lamp suspender. James Ruddick and Henry Ernest Fry, 24, John-street, Bedford-row, London.

21268. Improvements in or connected with magneto-electric apparatus for igniting the charge in internal-combustion motors. Maurice de Saint-Romain, 47, Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, April 27, 1905, being date of application in France.) (Complete specification.)

21268a. Improved construction of accumulators or secondary batteries. Alexander Elias Dakhyl, Antonio Galanti, and Hanna Nassyf Dakhyl, 175, Fleet-street, London.

21279. Improvements in electric batteries. Arthur John Fippard, 33, Cannon-street, London.

21289. New or improved apparatus for indicating and obviating leakage from conductors of electricity. John Miles Moffat, Rueben James Bott, John William Manley, and the Electric Safety Appliances Company, Limited, Norfolk House, Norfolk-street, Strand, London.

21290. Improvements in protective devices for automobile motors. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

Oct. 20.

21383. A new or improved method and means of hermetically sealing a wire or metallic electric conductor or other substance through or into vitreous substance such as lead Jena or quartz glass. Charles Orme Bastian and George Calvert, Birkbeck Bank-chambers, Chancery-lane, London.

Oct. 21.

21386. Improvements in or relating to electric lamps of the character known as vapour lamps. Robert Francis Venner, 6, Old Queen-street, Westminster, London.

21391. Electro-deposition of zinc. James Swinburne, 82, Victoria-street, London.

21439. Improvements in and relating to electric switches. The British Thomson-Houston Company, Limited, and Edmund Basil Wedmore, 83, Cannon-street, London.

21444. A new or improved electromagnetically operated heat-supply valve for heating and ventilation. Fritz Kaeferle, 31, Bedford-street, Strand, London. (Date applied for under Patents Act, 1901, July 17, 1905, being date of application in Germany.) (Complete specification).

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 9.

1904.

22164. Apparatus for use in the distribution of alternating electric current. Berry.

22369. Means or apparatus for regulating the difference of potential between portions of electric current distributing systems. Berry.

22522. Arc lamps. Wellington and Daniell.

22631 Methods of exciting electromagnets by alternating electric currents. Latour. (Date applied for under International Convention, Oct. 20, 1903.)

22962. Vacuum brake apparatus for electrically-operated and other trains. Gresham, Gresham, and Kiernan.

23205. Regulation of alternating electric distributing systems. British Thomson-Houston Company, Limited. (Allgemeine Elektricitäts-Ges.)

24620 Electric clocks and the like. Parsons and Ball.

25331. Treating the contents of electrolytic cells. Hargreaves.

26588. Systems of electrical distribution. British Thomson-Houston Company, Limited. (General Electric Company.)

26589. Electric switches. British Thomson-Houston Company, Limited. (General Electric Company.)

26603. Apparatus for forming devices for holding or suspending overhead electric conductors, or trolley wires or the like. Winslow.

26849. Apparatus for electro-deposition of metals. Bailey.

27201. Electrostatic wattmeters and watt-hour meters. Wilson.

27235. Emergency brakes for railway and tramway vehicles or trains. British Thomson-Houston Company, Limited. (General Electric Company.)

27404. Machines for making compound lengths of wire, rods, or the like from two metals and for counting and arranging the same in boxes. British Thomson-Houston Company, Limited. (General Electric Company.)

27763. Coin-freed mechanism. British Thomson-Houston Company, Limited, and Kingwell.

29138. Electric dry batteries. Day. (Empire State Dry Battery Company.)

29231. Apparatus for opening and closing electric circuits at predetermined times. Gunning.

1905.

1009. Electrical connections for secondary batteries or accumulators. Elieson.

1224. Trolley retrievers for electric tramcar and the like. Earll.

1400. Incandescent electric lamp sockets. British Thomson-Houston Company, Limited. (General Electric Company.)

1762. Means for electrically turning on and lighting up gas lamps, and particularly those whose burners are beyond reach of hand. Pare.

2579. Protector or cover for electric conductors, pipes, or the like. Wilhelmi.

3049. Combined electric coupling and two-way plug. Stokes.

2739. Protective devices for electric circuits. British Thomson-Houston Company, Limited. (General Electric Company.)

4353. Compensating poles for dynamo-electric machines. Elektrizitäts Act. Ges. vorm. W. Lahmeyer und Co. (Date applied for under International Convention, April 16, 1904.)

4881. Electromagnetic brakes. British Thomson-Houston Company, Limited, and Larzelere.

5042. Electrically-operated pianos. Weber.

5049. Electric insulators. Bloxham. (Goffin.)

7036. Electrically-propelled vehicles. Weiss.

8524. Safety appliances for exposed electric conductors. Thorne.

8631. Dry battery. Weatherill.

10669. Combined electric switches and fuses. Callender's Cable and Construction Company, Limited, and Ward.

11036. Alternating-current measuring instruments. Conrad and Bradshaw. (Date applied for under International Convention, May 27, 1904.)

11362. Galvanic battery plates. Hubbell.

13383. Electric conductors and methods of insulating the same. British Thomson-Houston Company, Limited. (General Electric Company.)

13425. Cluster electric lamp sockets. Fairweather. (Benjamin Electric Manufacturing Company.)

15591. Devices for electromagnetically influencing the arcs of electric arc lamps working with alternating current. Carbone.

17146 Particular type of rheostat. Veritys Limited and Gott.

17170. Device for conveying fresh air, telephonic, and other messages to the interior of submerged submarines, applicable also for other purposes. Smith.

NOTES.

British Association.—The General Purposes Committee held a meeting on Tuesday last in order to decide upon the town where the association should meet in 1907. Invitations were considered from Leicester and Dublin, and it was decided that, having regard to the fact that no meeting had ever been held in Leicester, to accept the cordial invitation from that town.

Book Received.—"Die Drahtlose Telegraphie," by Dr. Eugen Nesper (Julius Springer, Berlin. 3s.). This treatise deals with the influence of wireless telegraphy on economics, and treats especially with the "Telefunken" system. There are 29 illustrations, and the value of the work is further enhanced by the addition of a patent and literary bibliography dealing with the subject.

New Pacific Cable.—It is reported that information has been received at the North German Cable Works at Nordenham, announcing the successful laying of a cable between Shanghai and Yap, the principal island of the Caroline group. The work was carried out by the cable ship "Stephen," and the final test showed that the electric condition of the cable was perfect. The cable was opened for the reception of messages on the 1st inst.

Military Telegraphy.—For some weeks past the French War Office has been actively engaged in conducting experiments with a view to securing reliable communication for military purposes between Paris and the eastern garrison towns by means of wireless telegraphy. Though many difficulties had to be encountered, these were eventually overcome, and after the system had been extended as far as Vardun and Chalons, the important stronghold of Belfort was furnished with apparatus for wireless telegraphy. There is now complete and permanent communication between Paris and all the eastern garrisons.

Post Office Changes.—Two important changes are announced in the personnel of the Post Office staff by the retirement of the controller (Mr. E. Trenam) and the deputy controller (Mr. J. W. Eames), which took effect on Tuesday last. The new controller, whose appointment is officially announced, is Mr. A. E. Eames, brother of Mr. J. W. Eames. Mr. A. E. Eames has been the senior assistant to the controller. The new deputy-controller is Mr. J. Newlands, who in 1901 succeeded Mr. Trenam as traffic manager, the appointment he now vacates. A very pleasant and interesting ceremony took place at the Central Telegraph Office on Tuesday last, when Mr. E. Trenam, the late controller, was presented with a gold watch and chain as a token of esteem and regard by his London and provincial colleagues.

Wireless Telegraphy.—Reports continue to circulate recording the development of the system of wireless telegraphy, and it is now stated that two new vessels, which are being built for the Cunard line, are to be equipped with long-distance transmitting and receiving instruments, at a cost of £4,600 each. While crossing the Atlantic, Mr. Marconi is reported to have received wireless messages from both England and America, but owing to the fact that the "Lucania," on which he was travelling, was not fitted with instruments sufficiently strong, he was unable to send replies. It is further stated that the Navy Yard at Washington recently intercepted a wireless message from the "West Virginia" to the cruisers "Colorado" and "Pennsylvania," a distance of 1,100 miles, mostly overland. Communications with the "West Virginia" lasted three hours, until the noise of work being resumed in the yard interrupted the messages.

Heat Engines.—In his presidential address to the members of the Birmingham University Engineering Society, on "The Possibilities of the Heat Engine," Prof. F. W. Burstall pointed out that, owing to the advanced stage which the science of thermodynamics has reached, we can easily predict the lines on which the heat engine of the future will be developed. He considers that the steam-engine has reached its maximum efficiency, and that much more development in this form of engine cannot be expected, owing to its great loss of economy. He looks in the future for the utilisation of the sun's heat direct for heat engines. Discussing the prospects of the gas engine, Prof. Burstall said that the future ideal production would be an engine with a very high compression, thorough scavenging action, and of the four-stroke cycle. He considered that the outlook for the success of gas-turbines was remote, the practical difficulties in their way being so great.

Electrical Driving.—The superiority of electricity as a driving force was demonstrated in a lecture which Mr. Percy Rosling delivered at a meeting of the Leeds Association of Engineers. He treated his subject from a commercial standpoint, and enumerated the points to be considered when an electrical drive was brought into comparison with a purely mechanical one. As to the question whether it was more economical to be supplied with current from a private generating plant or from a central power station, the lecturer held in favour of the latter as a source of supply. He claimed that, in order to bring the capital spent on generating plant into line with the capital used in a business generally, it was necessary to debit it with an adequate percentage. There was, therefore, a considerable saving due to the extra output obtained through the greater average speed of the electrical drive, as, moreover, the use of induction motors eliminated the loss due to the slips of the main and intermediate belts.

Steam v. Electricity.—Addressing the Wolverhampton and District Engineering Society, of which institution he is president, Sir Alfred Hickman laid stress upon the necessity for the adoption of up-to-date methods in the factory and the utility of scientific instruction to those engaged in engineering. Commenting upon the change in motive power which had taken place in connection with manufacture in the Midlands, he asserted that the supremacy of steam had not only been challenged, but superseded. For his own part, he had put on the scrap heap 24 steam-engines, and instead utilised electric motors supplied from a generating plant with gas-engines as prime movers. The consequent saving in fuel alone amounted to £7,500 a year. He believed that soon all steam-engines would be done away with or kept on one side for emergencies. The principle at the bottom of this change was that, instead of pressure, they had explosion and a higher thermal efficiency. This seemed to be revolutionising the whole system of motive power in the country.

Telephone Cable.—One of the problems which confronts the telephone engineer is to obtain a cable on which the losses occurring in the line may be minimised, and one which may be at the same time commercially possible. Experiments, however, have been made on a new type of cable in Sweden, and the results are said to be extremely favourable. In manufacturing these cables, the intention had been to reduce their capacity to a minimum by passing the bare copper wires through perforated discs of insulating material and introducing the cable thus formed into an iron tube. The distance of the two conductors of the same line is 1·7mm., that of two lines 2·8mm., and the distance of the conductor and

Digitized by Google

iron sheath in the most unfavourable case 5mm. By this arrangement the capacity of the internal conductors of 2mm. diameter was reduced to 0·00985 microfarad for 1 km. and that of the outer conductors to 0·0182 microfarad per kilometre. The copper wires are wound helicoidally to avoid induction effects. If the above distances be increased to 20mm., 36·5mm., and 10mm. respectively, the capacity will be 0·00935 and 0·0125 microfarad.

London Supply of Power.—We gather that the fight for the right to supply power in bulk throughout Greater London will be even more keen in the 1906 session of Parliament than it was this year. The number of applicants will be larger, and the opposition between the rival promoters will lead to a harvest both for the parliamentary Bar and for expert witnesses. If our information is correct, there will be two municipal applicants for powers—*i.e.*, the London County Council and an association of a number of metropolitan borough councils. Amongst the companies applying, the Administrative County of London Company, which, under the direction of Mr. C. H. Merz, was so nearly successful, will be again to the fore, and the rival applications will include one from the City of London Electric Lighting Company. The County of London Electricity Supply Company are also applying for a wider area for power distribution purposes, and a combined application, in which the Westminster Electricity Supply and St. James's and Pall Mall Companies are interested, is also to be made. All the applicants cannot receive the further powers they seek, and it is exceedingly likely that the session will terminate before the usual time in August, so that no decision may be arrived at on the question.

Elements of Iron.—At the opening meeting of the Sheffield Society of Engineers and Metallurgists, a lecture on "The Behaviour of Phosphides and Carbides when together in Iron" was given by Mr. J. E. Stead. Results were given confirming Prof. Arnold's and Mr. McWilliam's observation that solid phosphide of iron diffuses into solid iron and steel at elevated temperatures. It was also shown that when iron phosphorus and carbon are associated in local patches at high temperatures, on cooling the steel slowly, the carbon is expelled into the surrounding iron or steel, and that this peculiar behaviour is responsible for the existence of the white ghost lines or threads in large forgings. The lecturer proved that on reheating such annealed steels the carbon diffused back again into the carbonless portions, and could be retained there by comparatively rapid cooling. The micro-structure and mechanical properties of a series of steels were described, and proof was given of the existence of three distinct modes of segregation: (1) the microscopic in the body of the crystal itself; (2) the minor segregations which were entangled at the junctions of the crystallites; and (3) the major or axial segregation well known to all steelmakers. The lecturer suggested that if large ingots of fluid steel were revolved on their axes during the freezing period, probably the ghost lines would not appear in the forging, or if they did they would be very small; the reason for this belief being that motion of the fluid steel would tend to the production of small crystals, and small entanglements of the segregated portions, whereas illustrations were given showing that sometimes the crystals in very large ingots were as much as 7in. in length.

Air Conductivity.—During a recent trip from Liverpool to Boston, Mr. J. E. Burbank was afforded an opportunity for making some observations on the specific conductivity of the air at sea. In the September issue of *Terrestrial Magnetism and Atmospheric Electricity* of Baltimore there appears a description of the instrument employed, which was a new one devised by Dr. H. Gerdien. It consists of a tube about 20cm. in diameter, in the centre of the lower side of which is a side tube connecting with an electroscope. The inner electrode consists of a thin brass tube with hemispherical ends 1·4cm. in diameter, placed in the axis of the tube and connected with the leaf holder. In the rear part of the tube is a fan driven by hand by means of a worm gear. This fan drives a current of air through the tube, and observations made manifest that the velocity of the air currents through the tube may vary within wide limits without changing the observed values of the conductivity. During the voyage, however, it was found convenient not to use the fan, but to allow the wind to blow through the tube. This method was found to be just as reliable as when using the fan. By means of the latter instrument, the time required for making observations was greatly reduced, satisfactory readings being obtained in from three to five minutes. The excellence of its insulation was shown during a dense fog which prevailed, the inner becoming so damp as to necessitate its frequent removal for the purpose of drying. Leakage tests made after the observations, however, showed no appreciable fall of potential. The results showed conductivities varying from one-third to two and one-half times those of the air at Göttingen and at Cheltenham, Md. On one occasion a heavy fog prevailed, and during that time the conductivity fell to about one-tenth that of the Göttingen air. The fog appeared to affect both kinds of ions to nearly the same extent. Other fogs showed the same effect of decreasing the conductivity, but none to the same extent just mentioned.

Electrical Engineering Progress.—At the annual conference of the Leeds Section of the Institution of Electrical Engineers, Mr. A. B. Mountain delivered an address on the development of electricity supply undertakings during the last 10 years. He gave some interesting figures showing the advance which had been made since 1894, when there were 60 undertakings with a capital expenditure of £6,107,680 as against 445 undertakings with a capital expended of about £61,962,000 at the end of 1904. The consuming devices reduced to the equivalent of lamps had increased about tenfold, whilst the number of units sold increased about 15 times, the price of units meanwhile having decreased by 48 per cent. The uncertainty of electricity works proving financially successful, and the small scale upon which such works were planned, together with small generating plants installed, were some of the many difficulties which had to be encountered 10 years ago, and led to the growth of capital expenditure at the same rate as lamps connected. Present experience proves that by providing large generating plant, the capital expenditure would be reduced 50 per cent. and that mains could be provided at a cost of about 20 per cent. less than in 1894, and, owing to the fact that the pressure of supply has been doubled, such distributing mains will now supply four times the number of lamps. Mr. Mountain is at a loss to understand the capital expenditure and lamps connected increasing at the same rate. He considers the explanation is due to the extension of works and mains having been carried out upon extensive lines to meet future requirements, in which case further lamp connections should improve to a very large extent the results obtained from undertakings. He instances the case of Huddersfield, where the total capital expended upon the undertaking per 8-c.p. lamp was, in 1894, £3, and is now £1. 5s. 1d. The conclusions to be drawn from Mr. Mountain's survey of the progress of electric supply undertakings are that the introduction of

Digitized by Google

large generating plants will lead to ultimate economy, and that reduced charges will still further enormously increase the output of energy for both lighting and motive power purposes.

Electrolytic Metal Wires. — The possibility of obtaining thin metal wire by electrolytic means is discussed in a paper contributed by M. Henri Abraham to the French Academy of Sciences, in which the author suggests a method somewhat similar to the well-known Wollaston process of making platinum wires. The wire which is to be reduced in cross-section is taken as positive electrode in an electrolytic bath; its electrical resistance is measured from time to time, the current being stopped as soon as the cross-section of the wire has attained the figure required. The electrolytic bath should be rather dilute so as to have a very great resistance, when the current will be uniformly distributed throughout the length of the wire without its being necessary to give the two electrodes a strictly determined relative position. In fact, nearly the whole of the resistance of the liquid will be in the immediate neighbourhood of the thin wire. Distilled water containing some thousandths of its weight of copper sulphate can be used as a bath when dealing with copper wire, or else a similar amount of silver nitrate if silver wires are to be treated. The operation should be controlled so as to be rather slow, in order to allow the metallic salt forming around the wire to diffuse into the bath. Unless this precaution be taken, electrolysis will show a rather unstable behaviour. Wherever the current happens to be too strong, an excess of salt will be formed; when the bath becomes too conductive, the current will augment and burn the wire. If, on the other hand, such salt as has been found be allowed to diffuse into the bath, the behaviour of the electrolysis will prove quite stable, as the thickest parts of the wire are preferably attacked, owing to the resistance of the neighbouring liquids being smallest in the neighbourhood of these points. Currents of about 0·01 ampere per square centimetre wire surface are especially convenient for the operation. The current intensity should be reduced as the wire becomes thinner, the preparation of a satisfactory wire lasting about half an hour. The author states that wires treated with necessary caution show sufficient homogeneity to allow their new disruptive load to be calculated approximately by dividing their former disruptive load through the ratio of their present and their initial electrical resistances.

Edinburgh Tramways.—Some time ago a motion was passed by the Corporation to remit to the consideration of the Tramways Committee the question of policy to be pursued by the Corporation in relation to its tramways. The results of the deliberations of this committee have been embodied in a lengthy report prepared by the town clerk, Mr. T. Hunter, in which the powers and obligations of the company are fully set forth and the whole situation exhaustively dealt with. At the outset, Mr. Hunter states that it is not desirable that an independent body, whose main object is the acquisition of gain, should possess any permanent exclusive rights in or over the streets of a large city where the local authority is able to take up the service. He strongly insists, however, upon the undertaking, if controlled by the municipality, being managed with prudence and on sound business principles, otherwise the results are likely to be disastrous. The whole history of the tramways undertaking is described, and it is pointed out in the report that the Corporation, by their actions, have virtually accepted the position as owners of the city tramways. At present the lines are leased to a private company, and the lease does not expire until 1919, so that, unless it is sooner terminated by agreement or otherwise, the question of the Corporation working the trams will not arise until. The report, however, urges the Corporation to take into consideration the course which should be followed by them at the termination of the lease, and make such arrangements as would tend to secure efficiency during the lease and continuity of traffic on its termination. Lengthened consideration is given as to the relative merits of the cable and electric systems, and the advice of Prof. Kennedy has been sought on the matter. He is of the opinion that Edinburgh is not a place in which the overhead traction system can be worked advantageously. He avers that the severe gradients, with its necessary limits of speed, would militate considerably against the electric system, and that under the circumstances the working costs per car mile will be probably considerably lower if a well-designed cable system is adopted. The cable system is at present in vogue in the city, but it may be expedient to adopt electric traction for future lines. The Edinburgh tramways are a profitable concern, and yield a net profit of £100,000 per annum. Out of the rent paid by the lessees, the Corporation, besides meeting the interest and providing a sinking fund for the redemption of the tramway debt, apply £5,500 per annum to the relief of the city rates. The result of past years' workings attest that the undertaking has capacity for expansion of traffic, and forms a valuable asset.

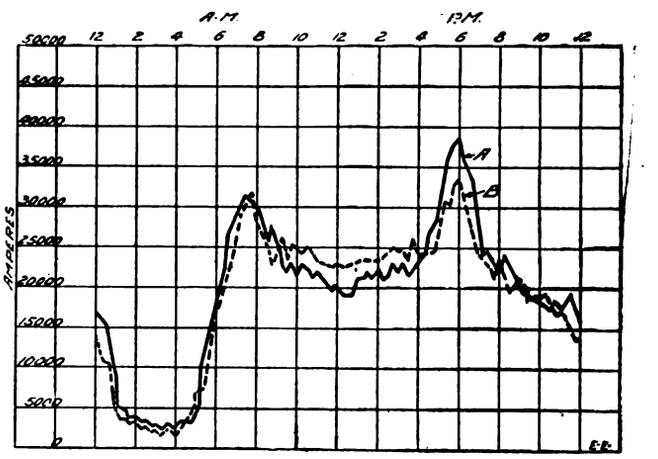
Phasemeters.—In a paper which he delivered to the members of the Physical Society on Friday last, entitled "The Theory of Phasemeters," Dr. W. E. Sumpner elaborated the results of some mathematical investigations and laboratorial experiments which he had conducted concerning the nature of these instruments. His study resolved itself into an examination of the behaviour of multiple magnetic circuits when actuated by independent currents, and his main conclusions may be thus summarised: Phasemeters for multiphase circuits are all equally accurate on balanced loads provided they have been correctly calibrated and possess no faults due to purely mechanical causes. Their accuracy is not affected by variations in wave-form or in current frequency. The calibration of the scale is affected by the number of coils used in the instrument, by the ratios of the ampere-turns used with these coils, by the distribution of the windings, and by the magnetic nature and properties of the magnetic circuits, especially if these contain iron; but the accuracy of the indications is not dependent upon any of these considerations if the working of the instrument is satisfactory from a mechanical point of view. Phasemeters can be simply and accurately calibrated for balanced loads by means of a direct-current method of test. The error of phasemeters on unbalanced circuits is generally serious for loads which are badly out of balance. The error, like that of a wattmeter, increases rapidly as the power factor of the load diminishes. It can only be reduced at the expense of complication in the instrument, by increasing the number of coils used in the fixed and moving systems, and by arranging the coils and magnetic circuits to be symmetrical in regard to one another. If the true power factor of the load is $\cos\phi$, the reading of the instrument is $\cos\phi + \theta \sin\phi$, where θ is the phase error due to the unbalanced load, and is product of two factors one of which is the maximum value of θ determined by the amount the load is out of balance, and the other may have any value between $+1$ and -1 and determines whether the instrument reads high or low. The maximum value of θ is as follows: (1) For an instrument consisting of a single coil for one-coil system, and of either two or three coils for the second system, $\theta = \epsilon\sqrt{2}$. (2) For a symmetrical instrument containing three coils in one system

Digitized by Google

and two in the other, $\theta = \frac{1}{3} \epsilon \sqrt{2}$. (3) For a mathematically symmetrical six-coil instrument, $\theta = 0$, where ϵ is the square root of mean square of the fractions ϵ_1 ϵ_2, ϵ_3, by which the three load currents differ from their mean value. It is also very approximately the arithmetical mean of the quantities ϵ_1, ϵ_2, ϵ_3, or two-thirds of the greatest of these three quantities, so that $\epsilon \sqrt{2}$ is essentially the same as the greatest of the quantities ϵ_1, ϵ_2, ϵ_3.

Central-Station Circuits.—The relative advantages and disadvantages of overhead and underground wires were discussed in the course of a paper delivered at the sixth annual convention of the Illinois State Electrical Association by Mr. H. B. Gear, with especial reference to the conditions in medium-sized towns. In America overhead lines have been employed almost exclusively by central-station companies in all except the large cities, principally because by means of this system a given amount of business can be transacted between generating station and consumer with a minimum investment. The maintenance of overhead lines is comparatively easy, but their exposure subjects them to a high rate of depreciation on account of the action of the elements. The principal advantage claimed by Mr. Gear for the underground conduits is that it is better able to withstand stormy elements, and in this respect is a greater security towards continuity of service. The disadvantage of the system, however, is that the necessity for repairs involves a larger expense and requires a longer time for completion than does the overhead. The failure of joints between overhead and underground lines on cable poles, due to the action of the elements, is a detail which has proved very troublesome. In order that some idea may be had of the elements entering into the cost of underground construction, the example of a system such as would be required for a city of 15,000 to 25,000 in a business district is chosen by the author to illustrate his case. Large manholes are provided at street intersections for the purpose of allowing ample room for the installation of transformers. Smaller manholes are provided at points where laterals are installed for services. Four ducts are provided, although only two of them are occupied by the primary and secondary cables which have been included in the estimate. The average central station has some series arc or 500-volt power service which would occupy the two remaining ducts, and though these were not occupied by such circuits, it would be advisable to instal them for future use. The primary cables are of No. 6, as this is the smallest size which it is practical to use for mechanical reasons. The secondaries have been figured on the three-wire system, the copper being No. 2 B. & S. throughout. Transformers of 15 kw. to 25 kw. capacity are assumed to be required to carry the load, a total capacity of 125 being assumed. The value of transformers is not included in the figures given, as they would be the same for either overhead or underground construction. The cost of installing the system above described, assuming that it were done as a job of under-grounding overhead lines, would be about £1,800. The cost of overhead lines of equivalent capacity to distribute the load provided for in the above-described underground system would not be over £400. The question which confronts the central-station manager is whether or not the income from consumers supplied in the territory would warrant an increase in fixed charges resulting from the adoption of the underground system. The adoption of the latter system in a residential territory would be more expensive, and the cost of current delivered to this territory would be about 3d. per kilowatt-hour more than with the overhead system.

Power-Station Load Charts.—In a paper read before the American Railway Mechanical and Electrical Association, held recently at Philadelphia, Mr. Lawrence P. Crecelius dealt with the question of keeping proper load charts of the loads at the power station. He outlined a method employed by the United Railways Company of St. Louis in increasing the load factors of the main power stations, and showed how the load factor in this case plays a prominent part in the cost of power per car mile. The system he described has in operation four power stations. Two of the larger stations—one of 13,950 kw. and one of 7,000 kw. capacity—are kept in operation continuously, and constitute the main central stations. The two smaller stations are operated on swing on weekdays during peak hours only. 'Bus wires have been run from the larger stations to both of the smaller ones, and there connected through circuit breakers and double-throw switches to either one of the two feeder 'buses with which the stations have been supplied. By installing double-throw switches on both the feeders and 'bus wires it is possible to operate them on one 'bus, to which any number of feeder sections can be connected, and at the same time operate the 'bus wires independent of the station on the other 'bus, to which the rest of the feeder sections can be connected. During busy hours the 'bus wires are connected to the same 'bus on which the stations are operated, thereby becoming equaliser wires. The amount of copper in the 'bus wires is sufficient to carry the load of the smaller stations during the less busy part of the day allowing a reasonable drop in potential. The results which are obtained from this system are shown by the curves on



the diagram, which represents the same curves of the two main stations when working during busy and light periods. Curve A represents the load of the main stations for the same day on which all four stations were in operation all day. Curve B represents the load of the same stations when taking the load of the smaller stations during the lighter part of the day. Thus it is found that in bringing up the load factor of the sum curves of the main stations from 50·23 per cent. in the first case to 57·7 per cent. in the second, and calculating on the basis of 310,000 kilowatt-hours per day, which is the average of these stations during the summer months, there would be a saving of about £38 per day when operating under these conditions.

Silent Electric Discharge.—An interesting paper on "The Synthesis by Means of the Silent Electric Discharge" appears in the October issue of the *Journal* of the Chemical Society from Mr. John Norman Collie. The author claims that to produce synthetically in the laboratory chemical compounds which are found in nature has always been one of the chief aims of the chemist, and more especially so when the compounds so to be prepared belong to the domain of organic chemistry. Prof. Meldola, however, has laid great stress on the fact

BOOKS for STUDENTS

For the City and Guilds Exams.

Electric Wiring.

A Primer for the use of Wiremen and Students.

By W. C. CLINTON, B.Sc. (Lond.), Demonstrator in the Pender Laboratory, University College, London.

With 80 Illustrations and a selection of Worked Examples. Third Impression. Fcap 8vo. **1s. 6d.**

"It is written in simple and comprehensive language, free from technicalities, except such as are duly explained in the course of the text . . . the section on jointing being exceptionally good . . . this little work is replete with useful information to those engaged in electrical wiring"—*Electricity.*

Metal Working.

By J. C. PEARSON, Technical Assistant to H.M. Inspector of Reformatory and Industrial Schools; Examiner for the Department of Agriculture and Technical Instruction, Ireland.

With 12 full-page Plates and many Illustrations in the text. Second Impression. Fcap 8vo. **2s.**

CONTENTS.—Chipping—Filing—Scraping—Vices—Vice Clamps and Filing Boards—Callipers; Centre Punch; Scribing Block; V-Blocks; Try Square and Foot Rule—Soldering—Riveting (Cold-Hammered)—Drilling—Screw Cutting—The Simple Lathe—Turning—Screw Chasing—The Screw-Cutting Lathe—Forging—Annealing—Hardening—Tempering.

The Rudiments of

Practical Mathematics.

By A. CONSTERDINE, M.A., and A. BARNES, M.A.

With 130 Diagrams, Answers, and Index. Fcap 8vo. **2s. 6d.**

"We do not say that the book is faultless, but it is certainly one of the best of its kind that we have ever seen."—*Electrical Review.*

SMILES' ENGINEERS.

REVIEWS.

Electric Traction. By ROBERT H. SMITH, A.M.I.C.E., M.I.Mech.E., M.I.E.E. With 14 Tables and 333 Illustrations. Harper Bros., London and New York. Price, 9*s.* net.

Second Notice.

When we come to deal with Prof. Smith's treatment of the practical part of electric traction we are very much in accord with him, although we do not think for a moment that this is the type of book which students will require 10 or 15 years hence. The subject of electric traction is comparatively new. Other forms of traction were largely in vogue in this country especially, and we have not yet left the period of conversion from one form to the other. The problem presented in a case of conversion is not exactly the same as if the designer had a free hand. The free hand is in many cases in the future. When it comes, little reference to horse traction or converted cars will be required in text-books. There is one phase of all Prof. Smith's work, not only in this book but elsewhere, that should meet the approval of every learner, and more especially every teacher. Writers and speakers are too apt to forget that man is endowed with at least five senses—some say six—and the real teacher appeals to as many of these senses as possible in order to render the impression he wants to convey permanent. We have far too many books loaded up with facts, merely appealing to the memory for the reproduction of those facts, but never appealing to the brain power for further utilisation of principles. The student who is not taught to think is never taught anything, and throughout life is only a nuisance to everybody who comes into contact with him. Prof. Smith even in his descriptive paragraphs is always interpolating a few sentences which ought to give the reader furiously to think. This

book is lengthy; it contains 12 long chapters, the first three dealing more directly with economics, the last nine with practice. Thus we have in the practical part chapters devoted to overhead, conduit, surface-contact, London deep-level, London surface and shallow, Berlin, Italian direct-current, Elberfeld monorail, Italian high-tension alternating and Swiss three-phase, and Zossen high-speed trials. Now, these chapters are all both difficult and easy to criticise—easy in a way because they describe actual works and the results of actual works; difficult because there is so much necessarily of a tentative character, which to indicate and discuss properly would need a book almost or quite as large as that presented to us by Prof. Smith Throughout he is thorough. His descriptions are clear, and his deductions and comments to the point. We should like, however, to confine our attention more especially to surface-contact work (Chapter VI.), because there seems to be more scope in that direction than elsewhere. In Chapter II., Prof. Smith, with certain exceptions, "The surface-contact system would be the ideal in respect of public convenience, etc.," and "Nevertheless, the surface-contact trams have not so far achieved any striking commercial success." He deals with this part of the subject fully in Chapter VI, where he describes the various systems that have been tried and which so far have not achieved success. Secondary batteries have failed, *vide* Chapters I. and VI.: "A connection capable of transmission of energy is not necessarily a conductive connection: it may be inductive." Most surface-contact systems that have attempted to utilise induction in such work have failed, for hitherto neither cost nor certainty of action have been satisfactory. Prof. Smith will probably take his revenge upon us in introducing the term cost while objecting somewhat to his combination of economy with technics, but we still shall hold to the view we have expressed. At present, cost is the factor decisive as to the use of one system over another Contact systems, however, are not restricted to inductive systems, but, as Prof. Smith says, "All the systems that have yet had any practical success have depended upon conductive contact between roadway and car, the main current along the buried insulated conductor being tapped and led through the car motors and back to the earth rails." But here again cost as against overhead or conduit serves to put the contact system into the background, though time and improvements may bring it into the running. The weak points of the system as described by Prof. Smith are: (1) leakage; (2) wear and tear of parts brought into contact; (3) switch certainty and efficiency; (4) switch arrangement. Each of these is discussed, and, as usual, equations are not lacking to show the student the results due to arrangement. The chapter after this general discussion shows that "the original proposal to employ insulated rail sections thrown into, and cut out of, contact with a main supply cable by a switch operated by an electromagnet carried by the car was made in the patent of Profs. Ayrton and Perry in 1882, so that in Britain since that date nothing but new special methods of carrying out this general idea can be subjects of valid patents" (p. 178) . . . The author goes on to describe the special methods proposed and tried, such as the Diatto, those of Dolter, Thompson-Walker, Claret-Vuilleumier, Vedovelli, and the Schuckert-Paul. The good and the bad points of these systems are emphasised—thus of the Vuilleumier: "If a new car comes in the section, propelled by its own momentum or otherwise, while the previous car has not yet left that section, and is being fed from the distributor, the new car is not only not fed as it comes into the section, but, when once it has entered, it is also out of phase with the distributor, and cannot be put into phase except by being pushed back to the end of the section. This fault is remedied by the Vedovelli system, but the latter will not reverse." Both these defects are avoided in the Schuckert-Paul system. Here we must stop. We have indicated divergence with the talented author, have attempted to indicate the matters with which he so ably deals, and by fuller references to one chapter to show how carefully and fully he treats his subject. Even if Prof. Smith had given us nothing but the description of

various classes of tramways or railways carried out in Britain and elsewhere, the book would be of great value, but this value is enhanced by his keen critical faculty, and by his capacity to formulate so much that concerns this phase of electrical engineering. The illustrations are very numerous, and the general get-up of the book excellent.

Armature Windings of the Closed Circuit Type. By WILLIAM CRAMP, A.M.I.E.E. Biggs and Sons, 139-140, Salisbury-court, London, E.C. Price 1s. 6d.

The volume before us is a comparatively small one, comprising about 120 pages, as compared with other books which have been issued on armature windings. The reason for this is that the writers of previous books have been rather too apt to look upon their subject from the mathematical point of view. The result is that a large number of windings are described and illustrated which, though electrically possible, are not feasible from a commercial point of view. Such collections including windings which are not warranted in practice are apt to confuse even the trained designer and to defeat what we take to be the main object of any such treatise. Mr. Cramp in his book has taken the opposite course, and devotes his whole attention to those forms of winding which are met with in everyday practice, and which have proved to have special advantages in various cases. There is no doubt that the student who has carefully gone through the instructions given in this volume will be fully equipped with information which will enable him to deal with special variations which may sometimes be called for. Thus, according to the preface, the book is intended for "those plodding and industrious workers who are not afraid of long hours or hard work, gifted with that all-British combination—*slowness* with *tenacity*." . . . "For such men has this little book been written; for these, and for those others, men who have a love for electrical engineering, yet, lectures or no lectures, are expected to earn their own living from the time they leave school." The subject is divided by the author into six parts, which deal respectively with (1) simple or simplex multiple circuit windings, ring or drum; (2) multiplex multiple-circuit windings, ring or drum: (3) simple or simplex two-circuit windings, drum; (4) multiplex two-circuit windings, drum; (5) two-circuit ring windings; (6) closed-circuit windings applied to alternators. The volume concludes with a summary of rules governing multiple and two-circuit winding, whether of the ring or drum type. We have carefully read through the volume, and find that the author has spared himself no trouble in making his subject clear. Not only are the various forms of winding and their special uses carefully described, but he also summarises from time to time the essential characteristics to be borne in mind of each system, and also the method in which to proceed to lay out the windings on the armature. The result is a book which will commend itself not only to the student, but also to the apprentice who in his workshop training desires to know the reason why the conductors on various types of armatures are connected in particular ways. The matter in the book originally appeared in the form of articles in the *Electrical Engineer*. The illustrations are clear, and leave little to be desired.

Theorie der Elektrizitaet. Part II.: "Elektromagnetische Theorie der Strahlung." By Dr. M. ABRAHAM. B. G. Teubner, Leipzig.

The first part of this work, it will doubtless be remembered, deals with Maxwell's theory of the electromagnetic field—the foundation of the modern theory of electricity. In the second part, now published, the author builds up the electron theory of radiation on this foundation, assuming space to be an infinity which serves as a medium for the electromagnetic effects whose origin is due to electricity. It is further assumed that the latter is composed of indivisible particles called electrons. Every electric current is conceived as a convection current of moving electrons, the cathode rays being composed of negative electrons, which move at great speed along parallel paths. This radiation opposes the wave radiation produced by the oscillations of the same minute particles. The theory

Digitized by Google

of both kinds of electromagnetic radiation is discussed in the volume before us. Chapter I. begins with the treatment of the physical and mathematical principles underlying the electron theory. The facts bound up with the acceptance of the theory are reviewed. From the fundamental equations of the electron theory the conception of the electromagnetic unit of motion is derived. General solutions of these fundamental equations are also given with the aid of the "electromagnetic potentials"—that is to say, the vector potentials of stationary magnetic fields.

Chapter II. enters into the theory of the emanation of light from a point charge which can be moved at will. The simplest imaginable electromagnetic model of a source of light is a single electron swinging round its position of equilibrium, but so far as wave radiation is involved it is shown that the electron may be substituted by a point charge in most cases. Thus the development of this chapter is interesting from the dynamic point of view, the more so because it is independent of any hypothesis as to the form of the electron. We see in the succeeding chapter, however, that it is necessary to assume some definite form for the electron in order to fully develop its mechanics. The author adheres to the conception of a fixed spherical-shaped electron, on which he bases the electromagnetic theory of the cathode and radium rays. Chapter III. is entirely devoted to the development in question.

The book is divided into two sections, the second of which deals with the electromagnetic phenomena in measurable bodies. The fundamental equations of electrodynamics, which combine the discernible electromagnetic vectors, may be derived, according to H. A. Lorentz, from the mean values of the equations which represent the fields of individual electrons. In this manner the fundamental equations of the Maxwell theory are obtained for fixed bodies. But for moving bodies the equations suggested by Lorentz are employed. These differ from those of Hertz for the electro-dynamics of moving bodies, and are in closer conformity with experience. That the electromagnetic and optical properties of dielectric bodies may be satisfactorily explained by the presence of polarised electrons is shown. Some problems are also introduced into this section which have but slight connection with the atomic hypothesis. Thus there are passages on the determination of the radiation due to currents of high frequency in straight conductors, which are of especial value in connection with wireless telegraphy.

As the author observes in his preface, the theory of electricity has apparently now entered upon a stage of steady development. The time seemed to him opportune for a halt to review what has been already accomplished, and the work which he has produced is the outcome of that conviction. He has certainly made a valuable contribution to the literature of the subject, and, while the pages of the book before us do not reveal much original thought, they bring us right up to date, and the thoroughness with which the author delves into the theory is deserving of all praise The latter feature, it must be admitted, is characteristic of most works of German origin, being very marked in this latest example, which runs into some 400 pages. We shall look forward to an English translation.

Elementary Electrical Engineering in Theory and Practice. A Class Book for Junior and Senior Students and Working Electricians. By J. H. ALEXANDER, M.B., A.I.E.E., late Lecturer on Electrical Engineering at the Kilmarnock Academy Technical Classes. With 181 Illustrations. London: Crosby Lockwood and Son.

This is another of the many excellent little text-books which cater admirably for the young student. We write these words advisedly, although we cannot as yet bring ourselves to believe that any of these books are written with a due conception of education. The purpose, however, for which they are produced is well known. The end usually is examination, and so long as the passing of an examination is taken as the sole end of education, so long will these books be produced. Mr. Alexander gives good information well arranged, and for its purpose has produced an excellent book.

Now & Invaluable Handbooks

FOR

Electricians & Students.

PRACTICAL ELECTRIC WIRING FOR LIGHTING INSTALLATIONS.

Suitable for Foremen Wiremen and Students, and for those who wish to acquire a practical knowledge of Wiring, Jointing, and Fitting for the installation of Electric Light.

By CHARLES C. METCALFE, A.M.I.E.E.,
Electrical Engineer to the Education Committee, Manchester.

Demy 8vo. With over 130 Illustrations from Original Drawings and Photographs. Price 5s. net; post free 5s. 4d.

Special Chapters are devoted to:—Fitting and General Arrangement—Tools—Accessories—Systems—Wires and Cables—Joints—Flexible Conductors—Insulation of Joints—Plans and Schedule—Specification—Installation.

ELECTRIC TRACTION.

By ROBERT H. SMITH,
Assoc.M.I.C.E.; M.I.Mech.E.; M.I.E.E.; M.I. and St I.; Whit. Schol.; Mem. Order of Meiji; formerly Professor of Engineering in the Imperial University of Japan; Professor Emeritus of Engineering in the University of Birmingham.

Demy 8vo, 8½in. by 5½in., pages xxiii.: 442. With 14 Tables and 333 Illustrations. Price 9s. net; post free 9s. 6d.

An up-to-date and authoritative work upon Electric Traction in all its aspects. The dynamic and constructional principles are dealt with in detail, and are mainly based upon examples already existing or actually under construction. The author emphasises the consideration of economic conditions and commercial results as aspects which call for more study than they generally receive, and supplies copious data from authoritative sources.

THE DISEASES OF ELECTRIC MACHINERY: Their Symptoms, Causes, and Remedy.

By C. KINZBRUNNER, A.M.I.E.E.
(Late of the Manchester School of Technology).

Limp Cloth. Price 1s. 6d. net; post free 1s. 8d.

No advanced knowledge of Electric Machines is assumed, and Special Chapters are devoted to:—Sparking—Excessive Heating—Dynamo Fails to Generate—Motor Fails to Start—Speed of Motor too High or too Low—Noise—Faults with Starters and Regulators—Alternating-Current Generators with Rotating Armatures—Alternators with Rotating Field—Single and Multiphase Induction Motors—The Installation, Care, and Maintenance of Electric Machines.

ELECTRICAL ENGINEERING.

By E. ROSENBERG.
(Translated by W. W. HALDANE GEE, A.M.I.E.E., of the Manchester School of Technology, and CARL KINZBRUNNER, A.M.I.E.E.)

Demy 8vo. Profusely Illustrated. Price 6s.

A comprehensive Text-book for all who desire a knowledge of the chief principles of the subject. It comprises, besides the fundamental phenomena of the electric current, dynamos and motors for continuous, alternating, and three-phase current, their accumulators and their apparatus, measuring instruments, electric lighting, alternating-current engineering, and polyphase work

STARTERS AND REGULATORS FOR ELECTRIC MOTORS AND GENERATORS: Theory, Construction, and Connection.

By RUDOLF KRAUSE.
(Translated by C. KINZBRUNNER, A.M.I.E.E., and N. WEST, A.I.E.E., of the Manchester School of Technology.)

Demy 8vo. Profusely Illus. Price 4s. 6d. net; post free 4s. 10d.

Special Chapters are devoted to:—The Conduction of Electric Current—Circuit Breakers and Circuit Breaking—Theory of Starters—Mechanical Construction of Starters—Calculation of Regulating Resistances for Generators and Motors—Construction and Connections of Regulators for Generators and Motors.

TESTING OF CONTINUOUS-CURRENT MACHINES IN LABORATORIES AND TEST-ROOMS.

By C. KINZBRUNNER, A.M.I.E.E.
(Late of the Manchester School of Technology).

Demy 8vo. Profusely Illus. Price 6s net; post free 6s. 5d.

Special Chapters are devoted to:—Resistance Measurement—Measure of Temperatures—Insulation Measurements—Measurement of Speed—No-Load Characteristics—Load Characteristics—Magnetic Measurements—Efficiency—Separation of Losses—Practical Testing of Continuous-Current Machines.

HARPER & BROTHERS,

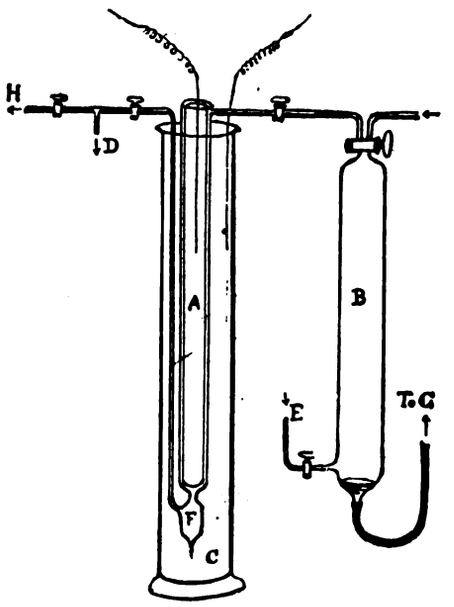
that chemists must not forget that the synthetical methods employed in the laboratory are almost entirely different and are not equivalent to vital methods, and he further points out that the fundamental synthesis *par excellence*—the photo-synthesis which plants are enabled to accomplish—is as yet without a laboratory parallel. To these ideas Mr. Collie called attention some years ago, and since then he has been engaged on various researches where the chief object has always been, as far as possible, to imitate in the laboratory the simple reactions which are constantly occurring in living organisms. But the chemist, by simply supplying energy in the form of heat to a mixture of carbon dioxide and water, cannot imitate the synthetical processes of the plant. By means of the silent electric discharge, however, a mixture of either carbon dioxide or carbon monoxide and hydrogen gives formaldehyde and methane. Experiments were made with carbon monoxide and ethylene. A mixture of these two gases was submitted to the silent electric discharge, and the apparatus



used was that shown in the diagram. A is the apparatus (length 22in., width 2in.) in which the gas was submitted to the silent electric discharge; B, the reservoir for the gas; C, a gas cylinder; D, leading to a gas circulator; E, leading from the gas circulator; F, receptacle for the product of the condensation; G, mercury reservoir; H, leading to mercury pump. From the result of the experiments, it was obvious that condensation to compounds of very high molecular weight could be induced by the silent electric discharge, even when the gases experimented with were surrounded by a freezing mixture. In conclusion, the author pointed out that the synthesis has been effected at the ordinary temperature; also by further oxidation at the ordinary temperature a series of aldehydes and acids can likewise be produced. He hopes to continue this research, as he considers the silent electric discharge eminently fitted for supplying energy to compounds.

Radium Rays.—The *Journal* of the Chemical Society contains the abstract of a paper by Mr. Ernest Rutherford on the charge carried by α and β rays of radium which appeared in the *Phil. Mag.* In order to determine the charge carried by the α particles, experiments were made with radium as nearly as possible in the condition of minimum activity so as to avoid complications arising from the presence of β-particles. A known small quantity of radium bromide was dissolved in water and the solution evaporated uniformly on a polished aluminium or glass plate. The film of radium thus obtained was so thin that only a very small fraction of the α-particles was absorbed by the radium itself. The saturation deposit due to the deposit thus obtained in the condition of minimum activity was measured between the radium-covered plate and a second plate placed above it at a distance of 3·5c.m., the electrodes being contained in a brass vessel, in which a good vacuum was maintained by Dewar's charcoal absorption method. The apparatus was placed between the pole-pieces of a large electromagnet, and the current was measured for various potential differences with and without the magnetic field, the radium-covered plate being in each case made positive and negative alternatively. When the magnetic field had attained a certain strength the magnitude of the observed current was practically unaltered by further increase, indicating that the field was strong enough to prevent all the electrons from reaching the opposite plate. Assuming that each α particle carries the same charge as an ion, then, from the value of the saturation current in the magnetic field and the known quantity of radium bromide employed, it is calculated that the total number of α-particles expelled per second from 1 grm. of radium at its minimum activity is $6{\cdot}2 \times 10^{-10}$, and in radioactive equilibrium four times as many. How speed electrons were emitted with the α-particles and the current conveyed by these is sufficient to mask completely the current due to the α-particles. The fact that the current without the magnetic field is always greater when the radium-covered plate is negative than when it is positive, shows that a greater number of electrons is emitted from this plate than from the other. The observations seem to indicate that these electrons constitute a type of secondary radiation resulting from the impact of α-particles on matter. For the determination of the charge carried by the β-particles, a rod of lead, previously exposed to radium emanation until the excited activity had attained its maximum value, and wrapped in aluminium foil of thickness sufficient to absorb the α-rays completely, was suspended as the central electrode in a metal cylinder which was evacuated The quantity of radium bromide corresponding with the γ-ray activity of the rod immediately after its removal from the emanation was first measured, and then in the above-mentioned apparatus the current due to the β-radiation was determined after a known time interval. From the known decay curve this current was corrected to the original condition of the rod corresponding with the determined quantity of radium bromide. It is calculated that the number of β-particles expelled from 1 grm. of radium per second is $7{\cdot}3 \times 10^{10}$. This result, which is probably a little too high, is in agreement with the theory of successive changes. From the calculated number of α-particles expelled per gramme per second several other constants are deduced. Assuming that only one α-particle is expelled during the disintegration of the radium atom, it follows that in a gramme of radium about 0·5 milligramme disintegrates per year. Assuming that each atom of radium gives rise to one atom of emanation, the maximum volume of emanation obtainable from 1 grm. of radium in equilibrium is 0·83 cm. From the previously determined kinetic energy of the α-particle $= 5{\cdot}9 \times 10^{-6}$, the emission of energy in gramme-calories per gramme per hour is calculated to be 126. The average number of ions produced by each α-particle in air at atmospheric pressure is calculated to be 86,000, or, since the range of particle is 3cm., the number of ions per centimetre of path in air at normal pressure is 29,000. The ionising power of the α-particles appears to be about twice as great as that of electrons. The average energy required to produce an ion is calculated to be $2{\cdot}7 \times 10^{-11}$ ergs.

TURBINE PLANT IN GLASGOW.

Two years ago it was found necessary to instal a large amount of new generating machinery in the stations of the Glasgow Corporation electricity department, and the then chief engineer, Mr. W. A. Chamen, after visiting several of the large works south of the border, in company with members of his committee, advised that the Port Dundas station (Fig. 1), a third of which was built and housed 10,000 h.p., should be extended, and that the new part of the building should be designed to contain six 3,000-kw. turbo-alternators. The committee decided to order two of these sets and another 1,500-kw. direct-current set to be erected in the St. Andrew's Cross station on the south side of the river.

Considerable difficulty was experienced in getting boilers within the space available and at the same time keeping to the original scheme of bunkers, coal tanks, and stoker arrangements. The boiler units are the largest so far turned out by Messrs. Babcock and Wilcox, of Renfrew,

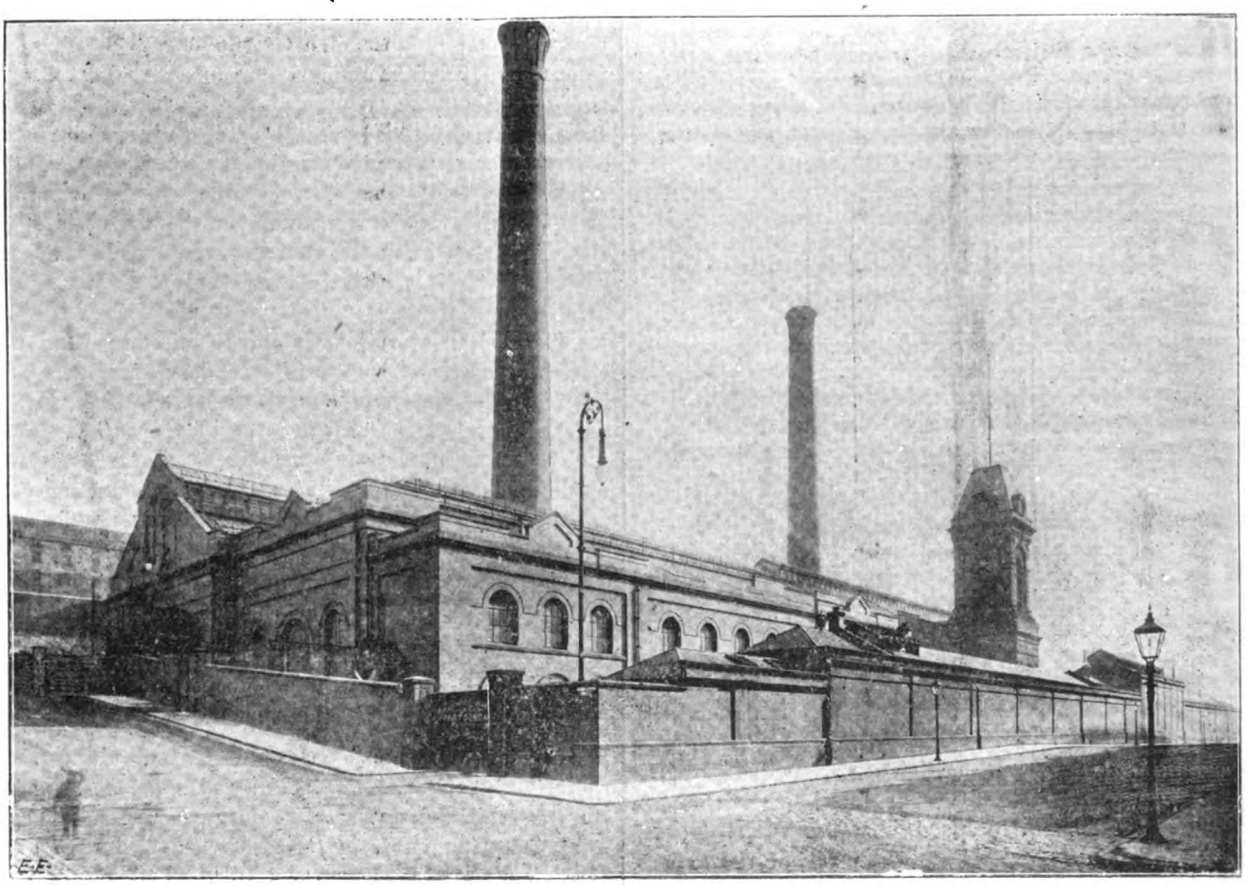

FIG. 1.—General View of the Port Dundas Electricity Works.

in connection with the generation of electricity. The boilers have each 6,182 square feet of heating surface, the grate area being 100 square feet. The working pressure is 200lb. per square inch. These boilers are fitted with superheaters and chain-grate stokers, the coal falling into the hoppers by gravity from overhead tanks through Avery automatic weighing machines. With a view to getting the most out of the boiler installation, Green's economisers and induced-draught fans have been fitted.

The turbines (Fig. 3) are direct coupled to three-phase alternators of 3,000 kw. normal capacity each, and arranged so that they are capable of giving an overload of 25 per cent. for two hours and 50 per cent. for half an hour. They have been made by Messrs. Willans and Robinson, and are of the Parsons type, with improvements which the makers have adopted in the turbines of their manufacture. The speed is 750 r.p.m., which was chosen in preference to the higher speed of 1,500 revolutions, these two speeds being fixed by the periodicity, which in this case is 25. At 750 r.p.m. the turbine sets work remarkably smoothly, and are practically noiseless; and although the turbine itself is of larger proportions than would be necessary in the case of a set built to run at 1,500 revolutions, there is no doubt that the slow speed has been chosen wisely.

The blading throughout the turbine is constructed on the well-known principle of Messrs. Willans and Robinson. The blades are built up in complete half rings before being put into the turbine, the blade rings being protected at their outer ends by means of a channel shrouding strip, which gives the blading a particularly sound and rigid appearance. The whole of the details of the turbine, governor gear, oil-pump, etc., have been placed on the lower half of the casing, and are arranged so that the bearing caps can be lifted and the upper half of the casing hinged back for the inspection of the interior of the turbine or working portions of the bearings and thrust gear.

The exhaust end of the turbine has been arranged so that the exhaust to the condenser is taken down through two pipes, which allows the exhaust end bearing to be rigidly supported close up to the bladed portion of the turbine spindle, thus reducing the length between the turbine end bearings, and making a particularly stiff support for the bearings between the turbine and generator.

The foundations consist of two concrete piers, one supporting the generator bed-plate and the other supporting the oil-tank, on which rests the steam end of the turbine. These piers are tied together with girders, which make the whole foundation arrangement very neat and amply strong. The throttle and by-pass valves are arranged in a separate box bolted to the steam end bearing of the turbine, and the governors are driven through gearing by a small extension shaft, driven in turn from the main turbine shaft. This governor gear and the thrust adjustment are designed so that there is perfect accessibility at all times without the possibility of derangement due to careless handling. The complete units run remarkably well in balance, and when compared with the reciprocating engines installed in the station give a striking example of the amount of power which can be got into small space.

The generators (Fig. 4) were built by Messrs. Dick, Kerr, and Co., Preston, and are of the revolving-field type, with 6,500 volts between terminals, the frequency being 25. The stator can be moved laterally to admit of inspection of the revolving element. At present the neutral point of he winding is not earthed. The surface-condensing plant

Digitized by Google

is of Messrs. Allen's manufacture, and arranged to give a vacuum of 2½in. below the reading of the barometer when the turbine is giving its full output of 3,000 kw. The air-pumps are of the three-throw Edwards type, and, along with the circulating pumps, are motor-driven.

The switchboard is of Messrs. Witting, Eborall, and Co.'s make, and arranged to eventually control eight three-phase generators and 20 feeders. The present installation, however, consists of apparatus to deal with two double-current generators, which have been used as direct-current machines for the last five years, and ten feeders. The switchboard is of the remote control type, and consists of two sections—namely, the operating panels and the high-pressure panels. The operating panels are located in the engine-room, and from them the high-pressure switchgear, situated in an adjacent room, is electrically controlled. The high-pressure panels are made of brickwork, concrete, and steel throughout, the open sides being covered up completely by removable screens of sheet metal. The different apparatus and gear contained in the high-pressure panels—such as switches, transformers, 'bus bars, etc.—are sub-divided and isolated, each leg being treated separately by means of vertical and horizontal dividing slabs. Everything possible has been done to make the switchboard fireproof and to avoid all chance of accidental contact with live parts. The 'bus bars are in duplicate, and interconnecting switches at the ends are provided to form a ring main when required. Selector switches are fitted, so that any generator or feeder may be switched on to either 'bus bar. The small wiring is all run in screwed iron pipes, excepting at the back of the operating panels. The generator and feeder switches are arranged with each phase in a separate oil tank and with four breaks per phase. The feeder switches, although normally only carrying 100 amperes as a maximum, are capable of breaking safely the total horse-power of the station. The instruments are worked by low-pressure supply from current and pressure transformers located in the distant high-tension compartment. The relays on the feeder panels are of the three-pole overload time-limit type and those on the generator panels of the reverse-current type without time-limit attachment, and the adjustment is so arranged that the switches will open should a reverse current equal to 50 per cent. of the normal full-load current get into the generator circuit. These relays may be cut out of action while the machines are being synchronised. The general arrangement of the gear is such that (1) accidental contact with any of the high-pressure gear, whether exposed or not, shall be absolutely impossible; (2) should any single piece of apparatus fail or fuse, the damage will be strictly confined to the compartment in which the accident occurs; (3) any panel or portion of the 'bus bars may be completely isolated by means of the section switches, for inspection, cleaning, or repair, without interrupting the supply in any way; (4) apparatus requiring occasional inspection, such as excess pressure dischargers, are placed in a readily accessible position, and proper provision is made for getting out the oil switches for overhauling or renewing the oil; (5) the only fuses used are in the primaries of the pressure transformers. The earthing of the framework, the cases of all transformers and switches, and the secondaries of the transformers and any part of the 'bus bars or high-pressure apparatus which men may require to handle has been carefully carried out.

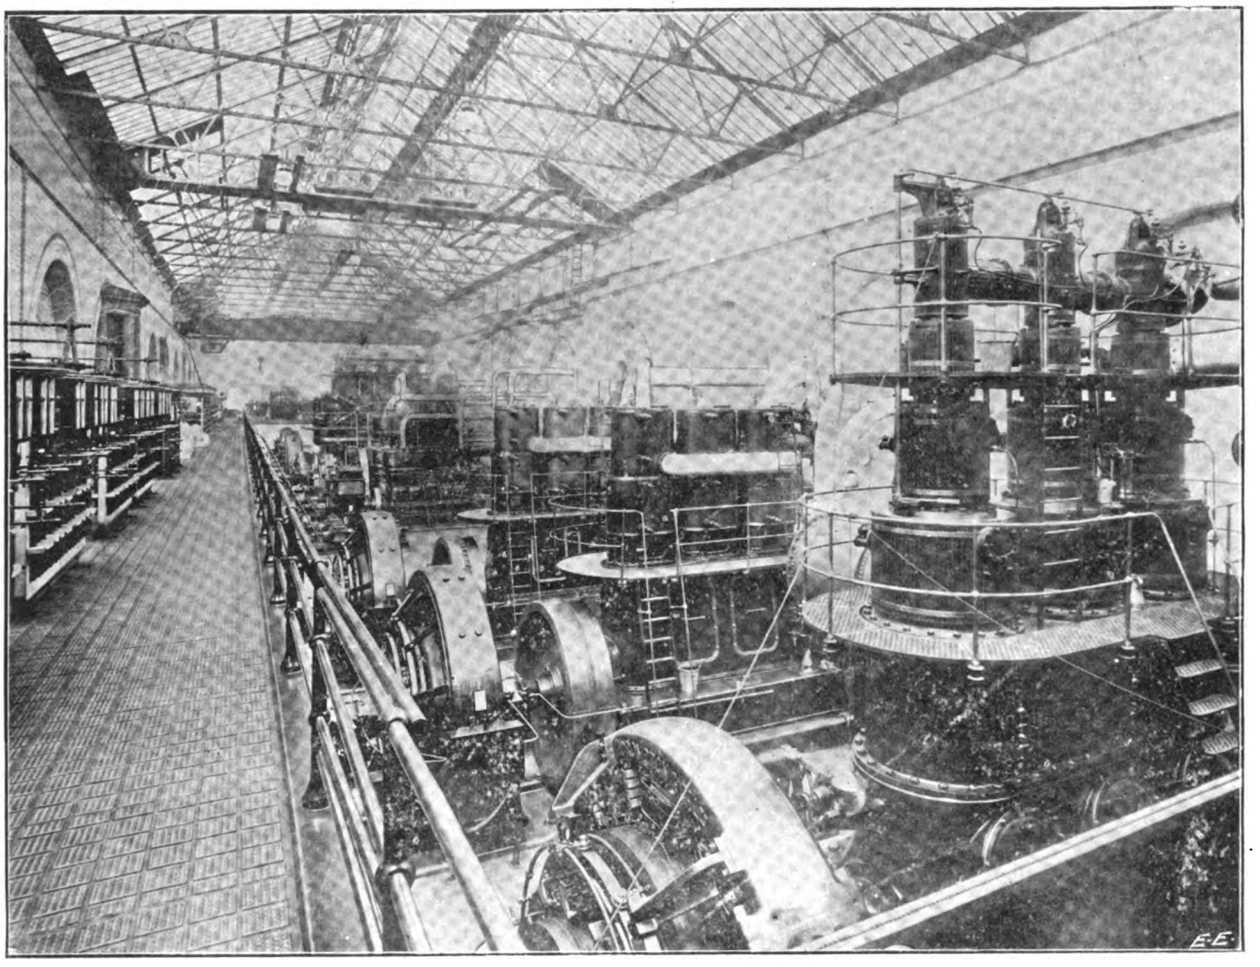

FIG. 2.—General View of the Port Dundas Engine Room.

The interconnecting cables are rubber covered and served with an incombustible double braiding and compound; where these connections pass through partitions or require support they are mounted on porcelain insulators and tubes. The cables from the power station switchboard are three-core, and run to several sub stations throughout the city. In the sub-stations 1,000-kw. and 500-kw. motor-generators are installed, manufactured by the British Westinghouse Company and the Electrical Company. The motors, which are of the induction type, take current at 6,500 volts right on to the stator windings. The direct-current side delivers current either at 250 or 500 volts for consumers' use. The motor-generators are all capable of being started up from the direct-current side, but there is also at least one set in each sub-station which can be started up from the alternating-current side in case of

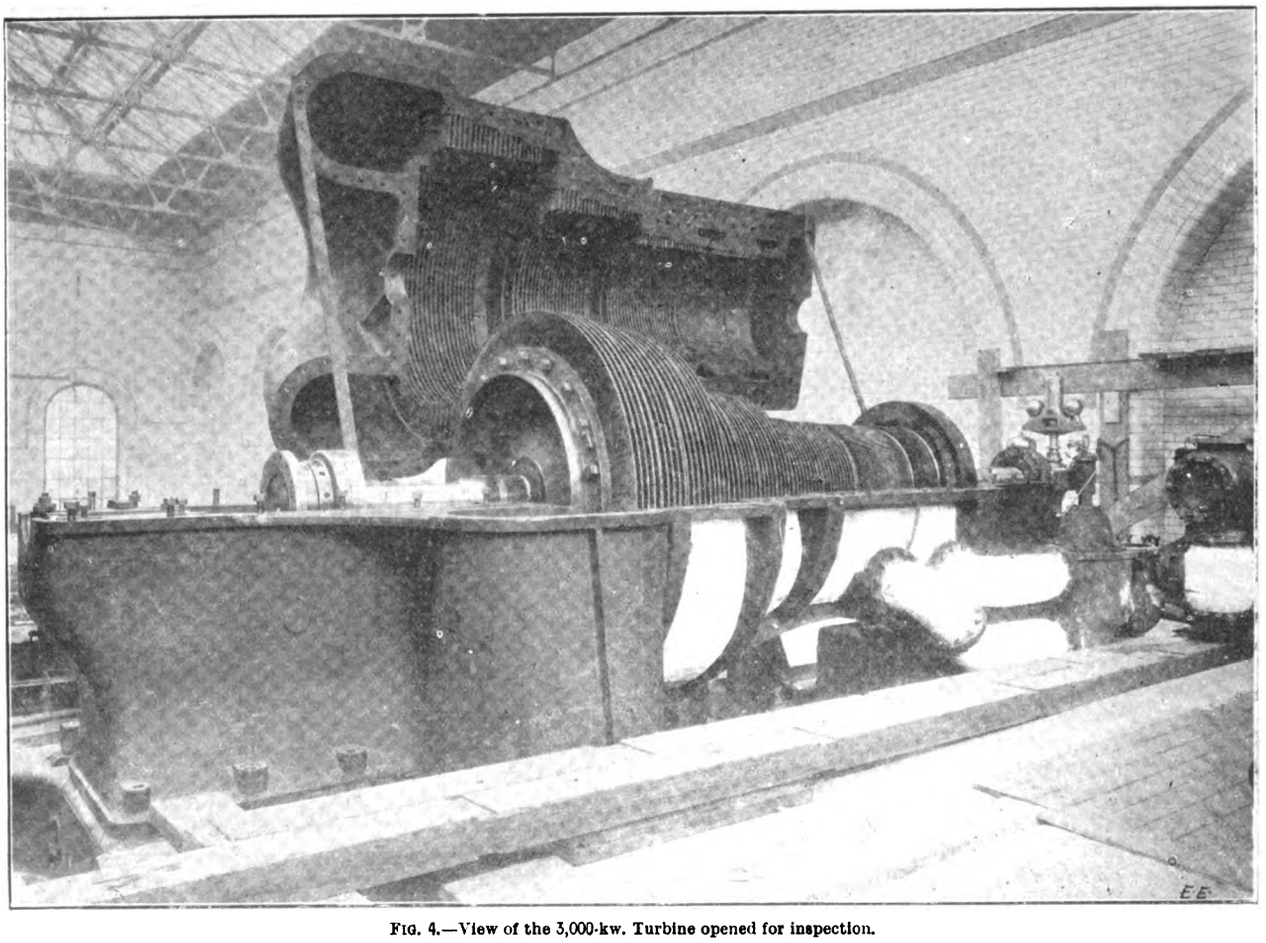

FIG. 4.—View of the 3,000-kw. Turbine opened for inspection.

the direct-current supply failing from any cause. For balancing purposes some of the 500-volt direct-current windings are tapped, the tappings being led to slip-rings and thence to choking coils, the middle wire connection being joined to the centre part of these coils. The starting switches in the sub-stations are all of the water type, and the results

Digitized by Google

obtained from these starters have been extremely satisfactory. The high-tension switchgear supplied by the British Westinghouse Company is on the same lines as that in the power station, and the direct-current switchgear consists of automatic non-return circuit breakers on each pole without any fuses, the only fuses employed being on the low-tension feeders.

THE TRANSMISSION OF POWER BY ALTERNATING CURRENTS.

BY ALFRED STILL, M I.E.E., A.M.I.C E.

(*Concluded from page 589.*)

Regulation of Pressure at Receiving End.—When the voltage drop is considerable, as will nearly always be the case in long transmission lines, it is necessary to raise it—*i e*, to regulate it so as to avoid variations with changing load. This may be done on a Δ-connected three-phase system by means of two regulators only, as indicated in Fig. 26. Here the points A, B, and C are the terminals of

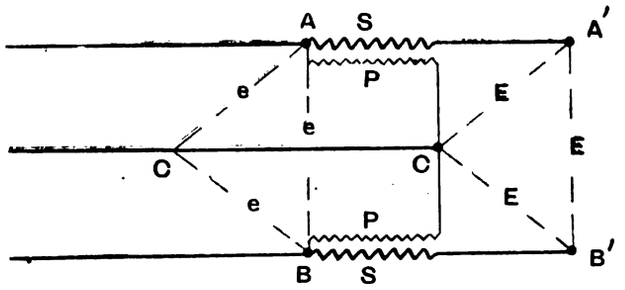

FIG. 26.

the transmission line. Imagine P and S to represent respectively the primary and secondary turns of a transformer. If we connect two such transformers in the manner indicated on the diagram, the effect will be to raise the pressure between *all three wires* to the extent of the volts added by the secondary turns, S Thus, if the pressure *e* = 16,000 volts and the ratio P : S = 4 : 1, the pressures E will be

$$16{,}000 + 40{,}00 = 20{,}000 \text{ volts.}$$

The diagram Fig. 27 will make this quite clear. Here A B, B, C, and C D are the three vectors representing the pressures *e* before boosting up: A A′ and B B′ represent the added volts between A and A′ or B and B′ (Fig. 26).

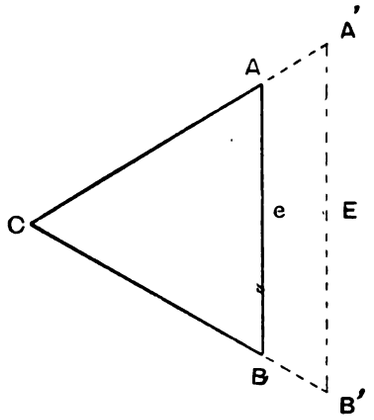

FIG. 27.

These added volts are evidently in phase with the pressures C A and B C respectively, because the potential difference at the secondary terminals of a well-designed transformer is always in phase with the primary E M.F. We have only to complete the triangle C A′ B′ to see that the two transformers, connected up in the manner described, will do all that is required in the way of raising the pressure on a three-phase circuit. It will be understood that regulation of this sort is usually carried out on the secondary side of the step-down transformers, but the principle is the same. Moreover, the transformers shown in the diagram Fig. 26 must be of the variable-ratio type, so that the added volts may be varied (by hand or otherwise) to suit the alterations in the load.

Boosters at Intervals along the Transmission Line.—In the event of a large pressure drop occurring between the generating and receiving ends of a long transmission line, it may be advantageous to provide boosters at one or more points along the line. There would appear to be a certain vagueness in the minds of some engineers as to the real object and possible advantage of using boosters along a transmission line. It is true that the energy put into the line at intermediate points cannot be cheaper—and, indeed, is usually more costly—than the energy supplied to the line at the generating end; but the booster system enables us to *keep up the pressure all along the line*, and hence the economy; provided always that the losses in the boosters themselves, their maintenance, and the necessary allowances for interest and depreciation do not counterbalance the saving.

As an example, consider a single-phase line conveying a current of 100 amperes at an initial pressure of 20,000 volts. Suppose the drop of pressure in the line to be 10,000 volts; this will leave only 10,000 volts at the receiving end.

The power put into line at generating end = 2,000 kw.
The loss in the line = 1,000 kw.
The power available at receiving end = 1,000 kw.

Hence *efficiency of line* = 50 per cent.

Now, imagine a booster to be inserted at a point half way along the line. This booster may be considered as a

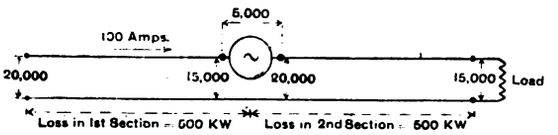

FIG. 28.

highly insulated alternator of 500 kw. capacity, capable of generating 100 amperes at 5,000 volts. The arrangement now becomes as shown in Fig. 28. The drop in the first section of the line is, as before, 5,000 volts, and the drop in the second section is evidently similar—*i e*, 5,000 volts—leaving the total waste of power in the line the same as before the booster was inserted. But by providing this booster at the middle point of the line we have been enabled to raise the pressure here up to the maximum initial value of 20,000 volts, with the result that we now have 15,000 volts (or 1,500 kw.) available at the receiving end. We have certainly not succeeded in obtaining this increased power without having to pay for it, but note that by keeping up the pressure we have been able to obtain it *without increasing the losses in the line.*

If, for the sake of simplicity, we neglect the question of booster efficiency, we now have:

Power supplied to the line = 2,000 + 500 = 2,500 kw.
Power lost in the line = 1,000 kw.
Power available at receiving end = 1,500 kw., and for the *efficiency of the line* $\frac{1{,}500}{2{,}500}$ = 60 per cent.

Boosters are generally arranged so as to take their power from the generating end—that is to say, they take the

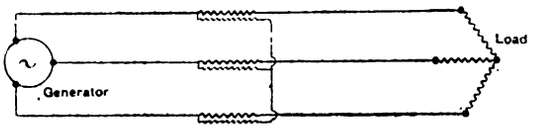

FIG. 29.

form of transformers which provide the extra volts at the cost of a corresponding loss of current. A three-phase transmission line, in two sections, with booster at the end of the first section, is shown diagrammatically in Fig. 29. Such boosters must be of the variable-ratio type, with hand or automatic regulation.

NOTES ON THE RELATIVE ADVANTAGES OF DIFFERENT SYSTEMS OF TRANSMISSION.

By way of introduction it may be mentioned that a comparison of various systems on general lines is not only useless, but impossible; there is no basis of comparison applicable to all conditions of practice, and each particular case must be considered on its own merits. The following

Digitized by Google

points should not be overlooked: (1) In comparing the relative cost of conductors necessary for two different systems of transmission, the *efficiency* must be the same in both cases—*i e*, the same amount of energy must be considered as being transmitted the *same distance* with the *same loss*. (2) What is to be understood by the *pressure* must be clearly defined. For instance, when comparing continuous with alternating current transmission, it must not be forgotten that the stress on the insulation is less with continuous currents than with alternating currents at the same $\sqrt{\text{mean square}}$ pressure. In fact, on the assumption of a sine curve wave, it is easy to see that—for the same power transmitted, at the same efficiency, and *with the same maximum stress on insulation*—the weight of copper for a single-phase alternating-current transmission would be *double* that required if continuous currents were used. Again, when considering alternating-current systems, it is necessary to decide whether it is the maximum potential above earth or the maximum pressure between wires which should be taken as a basis of comparison. Assuming the middle, or neutral point, of the various systems to be *earthed*, and allowing for a definite maximum pressure between any wire and earth, the comparison between the different alternating-current systems becomes a simple matter.

Let e and C stand respectively for the voltage and current *per leg* in either of the three systems, shown diagrammatically in Fig. 30. Then, the total power transmitted in each case will be $e\ \mathrm{C} \cos\theta \times n$, where $\cos\theta$, as usual, is the power factor, and n = the number of legs. If r be the resistance of each line conductor, the total line loss will be

$$\mathrm{C}^2\, r \times n,$$

and for the same line efficiency the weight of copper per horse-power transmitted will evidently be the same in all cases. This leads us to the conclusion that, *for any polyphase system*, the power lost in the line depends only upon the joint resistance of the conductors, the power transmitted, and the power factor, *provided the pressure between any wire and the neutral point is constant.*

Let us neglect the capacity and self-induction of the line, and assume that $\cos\theta$ is the power factor of the load at receiving end. Then,

$$\textit{power delivered} = n\, e\, \mathrm{C} \cos\theta = \mathrm{W},$$

and the

$$\textit{power lost in line} = n\, \mathrm{C}^2 r.$$

This last quantity, expressed as a percentage of the power delivered, becomes

$$\textit{percentage power lost in transmission} = \frac{n\, \mathrm{C}^2 r \times 100}{\mathrm{W}}.$$

Let us denote by R_p the joint resistance of all the line conductors in parallel—*i e.*, $\mathrm{R}_p = \frac{r}{n}$. This gives us for the numerator of the above percentage loss the expression

$$n^2\, \mathrm{C}^2\, \mathrm{R}_p \times 100.$$

But $n^2\, \mathrm{C}^2$ is equal to $\frac{\mathrm{W}^2}{e^2\, (\cos\theta)^2}$.

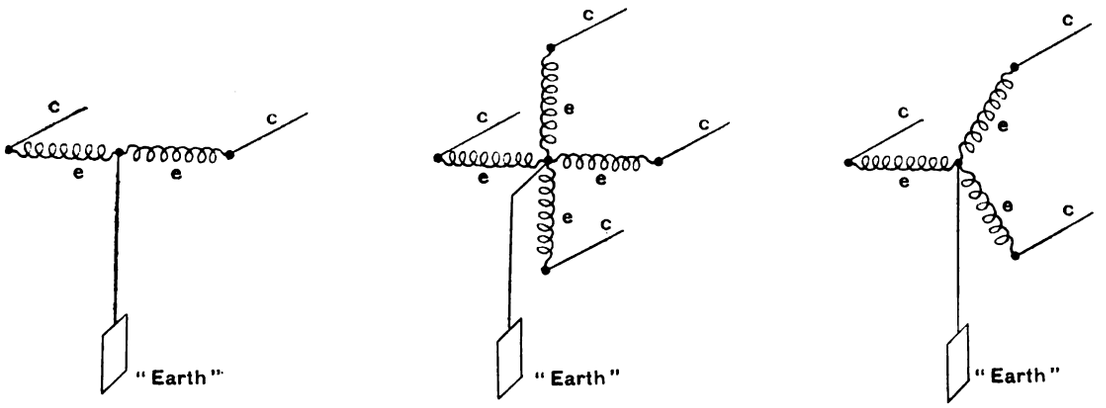
Hence we may write: Percentage power lost in transmission for *any* polyphase system

$$= \frac{\mathrm{W} \times \mathrm{R}_p}{e^2\, (\cos\theta)^2} \times 100.$$

It might at first sight appear as if there was nothing to chose between the various systems shown in Fig. 30, but it must not be forgotten that the potential difference *between the wires* has not been taken into consideration. When this is done, the advantage will clearly be seen to be in favour of the three-phase system; thus the maximum pressure between any two of the line wires will be 1·73 e for the three-phase system and 2 e for the single or four phase systems. Although we have assumed the case of an earthed neutral, there is much to be said in favour of a system without an earthed point, mainly as regards reduced risk of stoppage through a breakdown of insulation.

Where current for power and lighting is to be taken off the same mains, the two-phase system with the phases kept entirely distinct appears to offer some advantages; or the power may be transmitted by three-phase currents and converted into two-phase by a suitable arrangement of transformers as first introduced by Mr. C. F. Scott. In this case the frequency must not be lower than, say, 30 for incandescent lighting or, say, 45 for arc lighting.

If the load consists of small motors and incandescent lamps, a three-phase distribution at a frequency of about 30 will give very fair pressure regulation if the secondaries of the transformers are Δ connected. Even with a difference in load of 25 per cent. between the phases the alteration in voltage between the wires can be shown to be hardly noticeable, and the motor load will always tend to reduce the effects of any differences in the lamp loads.



Single-Phase Two (or Four) Phase Three-Phase

FIG. 30.

Another method applicable to a supply combining power and lighting is to connect all the lights across one phase only of the three-phase supply, and keep the pressure steady on this particular phase, leaving the pressure across the other two phases to adjust itself according to the load. This should not interfere with the running of motors connected across all three phases.

If the power is to be used for electric traction, the frequency must be low, preferably about 15 periods per second. The two-phase system has been advocated for electric traction on the ground that, for a given power, the current in the (two) trolley wires will be less, while the current in the rails will be greater than with the three-phase system, thus effecting economy in the line. (The section of the rails is usually such that their conductivity is higher than that of the trolley wires.) On the Valtellina Railway the transmission from the water-power station is by three-phase currents at 20,000 volts; this is transformed down in sub-stations to 3,000 volts, a lower pressure being, in this case, inadmissible, as it would involve the collection of abnormally large currents from the trolley wires.

For transmission of power to a distance the three-phase system would, on the whole, appear to have certain points in its favour.

Arrangement of Overhead Lines in Practice.—It is not intended to deal with any questions concerning the practical construction of transmission lines, or the calculation of

Digitized by Google

stresses and strains in wires or supports; but these articles would not be complete without a reference to various minor matters affecting the design of transmission lines from an electrical standpoint.

Distance between Wires.—The spacing of the wires will depend mainly upon the pressure between them. The formula

$$d = 6 + 1\tfrac{1}{4}\,V,$$

where d = distance between wires in inches, and V = pressure in thousands of volts, will be found to agree fairly well with the average of recent practice.

Height above Ground.—This will depend largely upon whether wooden or iron poles are used. There are many advantages in having high-tension wires a considerable distance above ground, and the practice of using iron poles or light towers spaced about 15 to the mile in place of wooden poles spaced, say, 50 to the mile, is becoming more and more common. Apart from the fact that the iron poles are more durable, the longer spans are an improvement from the point of view of insulation. Moreover, since fewer insulators are necessary, a higher price can be paid for them, and the best possible type adopted. In no case should any but the best and strongest insulators be used, as no ultimate saving will be effected through the use of cheap insulators. The height of the wires above ground when iron poles are used might be from 30ft. to 40ft., or even more in cases where very long spans can be adopted with advantage.

Aluminium Wires.—These are largely used in America for overhead transmission. For the same conductivity as copper their diameter will be about 1¼ times as great, and their weight almost exactly half that of copper: the tensile strength of the aluminium conductor will be greater than that of a copper conductor of equal conductivity. The cost, in practice, works out about the same for either metal, or, perhaps, slightly in favour of aluminium. The effects of snow, ice, and wind on the larger diameter of wires must not be overlooked. Again, since aluminium has a large coefficient of expansion, a greater sag must be allowed for than with copper. It has been noted that the sag in a span of aluminium wire 132ft. long has been reduced from 33in. at 100deg. to 13in. on a cold morning. Aluminium is liable to be attacked and corroded in the neighbourhood of manufacturing centres, and trouble has also arisen through crystallisation, which sometimes results from continuous vibration. Stranded conductors are probably preferable to solid wires. Bronze conductors have been recommended as being preferable to copper.

Protection from Lightning and Abnormal Pressure Rises.—This is a more important subject than can be adequately dealt with in these pages. The practice of running one or more earthed iron wires—whether ordinary or "barbed"—the full length of the line in the neighbourhood of the conductors meets with little approval at the present day, probably owing to troubles caused by falling wires. A good type of lightning arrester should be used at the stations and along the line. The horn type is liable to cause short-circuits during rain and snow falls, and should be covered. This type has also the disadvantage of being liable to set up electrical oscillations. The Wirtz arrester, with resistance in series, or both in series and in parallel, would appear to be fairly satisfactory.

The question of protection from lightning and abnormal pressure rises is one which has not yet been satisfactorily solved. In many cases, static discharges have given more trouble than they have prevented, and there is no doubt that it is advisable to reduce the number of safety devices as far as possible. At the same time, the most elaborate precautions may be found necessary to prevent interruption of supply during thunderstorms. The practice of insulating the beds and frames of alternators and transformers, which is fairly common in South Africa, would appear to have advantages, the principal disadvantage being increased danger to life.

The abnormal rises of pressure which are liable to occur when switching on or off a long transmission line may lead to trouble, in which case some device must be introduced with the switchgear to enable the pressure on the lines to be gradually raised or lowered. This can be done by running up a separate generator connected to the line, and afterwards paralleling with the 'bus bars; or a variable-ratio hand-regulated transformer can be inserted between the 'bus bars and the terminals of the line, this transformer being cut out of circuit after the switch has been closed on to the 'bus bars. In the case of overhead conductors it is not usual to insert any such charging devices, but if the line is a very long one, some method of gradually switching on and off may be necessary; where any considerable length of insulated underground cables is used, the sudden switching on or off of the pressure would almost certainly lead to trouble.

Mutual Induction. — Although the question of self-induction in long transmission lines has been treated at some length, no reference has yet been made to the inductive effects of one line on a second line running parallel with it, as would often occur in actual practice. The reason of this omission is that such inductive effects are generally negligible. In any case, they can be almost entirely avoided by suitably transposing or spiralling the lines. Thus, if a three-phase line be arranged so that each wire occupies the central position for a distance equal to one-third of the entire length, it should have no appreciable inductive effect upon a neighbouring parallel conductor. With two three-phase circuits supported on the same set of poles it is usual to transpose the wires of one circuit in the opposite direction to those of the other, but spiralling should be avoided as far as possible.

The chief trouble is with telephone circuits, the wires for which are frequently carried by the same poles as are used to support the transmission lines. This is not good practice if it can be avoided, seeing that the telephone will generally be needed most at times when there is trouble with the lines—*i.e.*, when possible out-of-balance currents in the overhead conductors are liable to interfere with conversation on the telephone. The wires for the telephone should, when possible, be supported on a separate set of posts. If suitable precautions are not taken, dangerously high voltages might easily be induced in the telephone circuit.

THE DISTRIBUTION OF ELECTRICITY IN MINES.

BY B. C. H. J.

(Continued from page 587.)

The classes of cable used in connection with pitshaft work comprise all known types; but that which should be recommended for the sample job under discussion is a pair of concentric conductor cables, each inner core consisting of ·25 square inch untinned stranded copper wire, paper insulated, the outer conductor also paper insulated, bitumen sheathed, stoutly taped over the bitumen, served with jute, impregnated with preservative compound, armoured with two galvanised iron wires, further doubly served with jute, which is finally impregnated with preservative compound. This may seem to be a somewhat elaborately made-up cable and the division of the total section of copper into two lengths may appear wasteful as to duplicating the armour, etc., required. But protective measures can hardly be carried too far in guarding against the accidents by flood and falls that beset the occupants of colliery pitshafts. In the event of one cable being damaged the other can be worked upon to a current density double that ordinarily used, as the insulation is paper, which prevents heat from affecting the bitumen sheathing.

Reference should be here made to the possibility of danger, in a certain class of paper-insulated multicore cable, from the amount of free oil left in the paper by the manufacturing process being unduly acted upon by gravity so as to pour down the interstices of the cable, with the possibility of bursting through a weak place in the lead sheathing, where the cable bends at the bottom of the shaft. As the buntons are so situated that the cable can be carried close up against the side of the shaft, and as the pit water is not particularly bad, in the instance quoted the two cables can be arranged for merely cleating to buntons side by side, with about 20-yard spans between the 4ft. long cleats.

The depths of pitshafts vary considerably, according to

Digitized by Google

the locality. In Scotland, for instance, pits are fairly shallow, being as a rule under 200 yards deep; in South Wales between 400 yards and 600 yards is usual, and in England the depths are mostly between these figures. The question of jointing depends largely upon the matter of depth, and it may here be mentioned that joints in pitshafts should, wherever possible, be avoided. The making of such joints is risky and costly, while the chance of their permanence is a small one unless very special precautions are taken. That joints are inevitable in some cases is evident when it is remembered that cablemakers are tied by practical considerations to a weight of about four tons gross per drum, so that the bigger the cable the shorter is the length in which it can be made. To avoid such joints, the lightly insulated swinging cable system of Mr. Holiday's is a considerable help; as for the size of the cable, the length per drum is greater than with insulated cables, and this practice as regards using long single cables is being appreciated in places where jointing troubles have occurred.

There is an objection to using single-conductor cables with alternating currents, as they are not so electrically efficient as three-core cables, but this is more a theoretical than a practical disadvantage, especially if the cables can be arranged for cleating up together in a bunch the shape of the ace of clubs, and not side by side. The rule (denuded of its mathematical garnishing) is that the closer the three cables are together, with equal distances between each and each, the more electrically efficient the arrangement. If jointing is absolutely necessary in the shaft, the best method is to excavate a chamber in the side of the shaft about 6ft. cube, so that the jointer and his mate may work in comfort and safety; supervision can be easily given, and the joint itself will then be protected in the best manner possible. This may seem an expensive business, but when it is compared with the cost of either rigging up a platform in the shaft, with a roof, or of using the cage exclusively (which is not always a convenient or even a sufficient arrangement), together with the risk of a badly-made joint under the dangerous and possibly damp conditions of working, and the moral certainty that sooner or later something will hit that joint in the shaft with a wallop, to its undoing, it will be seen that there is nothing to lose by making the better job at once.

And here is a fitting opportunity for mentioning to those who may not have had much experience with colliery working—that *the work must not be stopped*. In some mines this principle is so thoroughly understood that the usual mechanical factor safety of 6 is derided, 10 and 12 being considered the least possible figures. This means greater initial capital expenditure, but it is understood that the insurance as to continuous working and lack of accident to life or property is cheap at the price. It will be well for colliery managers if they follow this principle out when arranging for electrical working, and will restrain their lust for buying in the cheapest market. At the worst it is better to overpay one firm for provedly good material than to underpay a competitor for doubtful stuff.

Having cleated our cables, at the sides of the downcast shaft for preference, and made the least possible number of joints in pitshaft alcoves, we terminate mains at the switchboard, either at the bottom of the shaft or in the nearest airway. This switchboard should be in a chamber of its own, and so arranged that, should anyone be killed by contact with it, a verdict of *felo de se* would be returned by the jury. Such an arrangement for securing safety is common enough practice with ordinary electrical work, and it should be borne in mind that danger precautions should be multiplied by a constant of 3 in order to guard against the trebly superior foolhardiness of pitmen.

The runs from the main switchboard to the various points of supply will usually differ considerably in character, and therefore, before deciding on the type of cable, it will be well to go over the ground and to note its peculiarities. As in the case of pitshaft cables, there are in use underground a variety of cables and methods of installation, and every other pit manager or engineer has his own pet idea. The report of the Departmental Committee on the use of Electricity in Mines, published in 1904, says, "There are conflicting opinions about cable-laying. Some want the cables armoured; others think armouring a source of danger; some bury them in the ground; others hang them along the roof and sides; some advocate casing; others prefer to keep them constantly in view"; and it is very clear to one who understands how the varying conditions underground affect cables why these divergencies of opinion are so great.

For instance, the question of armouring a cable depends largely upon the degree of dryness of a mine. If a mine is very wet, then armoured cables should be used: (1) because, in the event of an unarmoured cable being damaged, the damp will make the outside of the cable a dangerous conductor in the neighbourhood of the damage, without giving warning at the switchboard; and (2) because it is easy to make earths in a wet mine for such stray current to go to from the armoured cable, and thus at once to blow the fuse so as to render a dangerous length of cable dead for the time. In dry mines, however, it is so difficult to make an earth connection that a fault upon a cable would only discover itself by a low insulation reading at the switchboard, and would confine its danger to the immediate neighbourhood of the fault. So that unless a man touched the actual "spot" on an unarmoured cable, he would stand no danger from casually handling the faulty cable. And the great and abiding consolation of being able to run the show without a stop would be in the heart of the manager. But faulty cable of the armoured type would as thoroughly shut down the mine, in most cases, as a faulty armoured cable improperly earthed would extinguish the man who came in contact with it. Therefore the decision as to the type of cable protection to be used in the workings should depend upon the degree of humidity prevailing. In some cases where armoured cables are in use, and an efficient earth is difficult to obtain, old wire ropes are buried in the roads or airways for considerable distances, being satisfactorily earthed at one point, and connection made at intervals to the armouring of the cables.

The question as to the style of cable to be used underground is often settled by the type of cable used in the pitshaft, as there is a big advantage in connection with the working and maintenance of electric cables to have them as uniform as possible. So that, as bitumen-sheathed cables were used in the shaft in this instance, and as they are as good as anything else for most situations, we will decide to use them underground.

As regards arrangement of conductors: two singles are preferred for situations where they are of moderate size and where duplicate mains are not used; as, if an accident happens to a concentric cable in most instances, it results in that calamity known as a "dead short." Whereas with single cables (especially when spaced well apart) there is much less chance of one or even two earths resulting in anything of so grave a character. As before mentioned, it is a safe maxim that when in doubt don't use armoured cables, so we will take advantage of it for the underground cables of this mythical installation, and will put in mains to the following specification: Cores consisting of untinned stranded copper wire, paper insulated, bitumen sheathed, stoutly taped over the bitumen, served with jute, impregnated with preservative compound. The method of installing this cable has to satisfy three requirements, if reference is made to the report of the Mining Committee—*i.e.*, liability of shock to workmen; of setting fire to woodwork, etc.; of originating a gas explosion. One simple rule only, however, need be kept in mind in this connection, and that is, permanency of working if necessary. (To this might be added the rider: Simplicity of access for examination and possible replacement, if injured notwithstanding precautions.)

Cables running along haulage roads may usually be laid under the roadway, preferably in a trough, when such roads are permanently arched, or they may be let into a chase in the wall, or they may be cleated to the timbering where such exists, preferably inside, out of the way of danger. If H girder arches are used, with billet packing, there is no other way than cleating the cables outside them, if they cannot be buried. In some mines, however, continual movement of the floor precludes the advisability of burying the cables. Where there is risk of damage in hanging cables up, it is best to run the mains in duplicate, one set on either side of the road upon cleats, and to have

Digitized by Google

special protection, such as split hose piping, slipped over them and bound down at intervals.

When laid in trenches, whether cased in troughing or not, it is very necessary that stones are not allowed to bind against the cable, or even to touch it. Many faults in connection with underground cables are caused by sharp pieces of rock being left near the cable and driven into it by the action of the punner, when the dirt is filled in. And this cannot be properly guarded against unless the cable is put into a trough that just fits it, with a properly fitting cover that will not be displaced by the conditions of reinstatement. The use of plain tiles in such circumstances is not advocated, as they are so easily shifted from their sheltering position, when not held in place by melted pitch, as is usual on public electricity mains. The use of such a pitched-in solid system can seldom be arranged for underground, especially in mines where firedamp is prevalent, but, needless to say, this makes a much more reliable system if properly installed. When buried, the depth should be such that a derailed truck will not touch the main.

In airways, which are not so well looked after as the haulage roads, timbering is usually used for supporting the cables, especially as falls of roof frequently alter the level (by as much as 10ft. in course of time), this level changing in somewhat similar style to the Irishman's blanket, when its owner cut off a portion of the head end and sewed it on to the feet end, in order to keep his lower members covered. These cable supports should be attached to the timbers as much out of reach as possible. A common method is to hang the cables by leather suspenders, spun yarn, string, or wire, to clout nails or lewis bolts let into the walling, roof, or timbers, with some slack cable between each support. The idea is that if a fall of roof occurs, the cable is easily borne to earth at the afflicted point by the light supports breaking, and the slack from both ends is pulled up to the point in question by the strain. This give-and-take arrangement acts well in some cases, but at times the binding refuses to give way until such excessive pressure is brought to bear upon it that the insulation is damaged at the obstinate point of support. And it should be remembered that the mining regulations now forbid the use of metallic fastenings for cables that are not sheathed or protected metallically. The most flexible method in present use is that of running the cables on stoneware bobbins which have a deep groove to hold the cable in position. These bobbins are free to revolve on a bolt which is either screwed into the timbering or cemented into the walling, and when going around bends an additional bobbin or guard is put in above the cable to prevent it riding over the flanges when brought into tension.

(To be continued.)

ALTERNATE-CURRENT ELECTROLYSIS AS SHOWN BY OSCILLOGRAPH RECORDS.*

BY W. R. COOPER, M A, B SC.

As the subject of alternate-current electrolysis is again attracting some attention, it may be an advantage to review briefly the views which have been put forward during the last few years. G. Mengarini in 1891 discussed the problem pretty fully, though not very clearly. He laid down the laws that the decomposition is always less than with an equal direct current—that is, equal as regards coulombs per second—the decomposition increasing for the alternate current as the current density at the electrodes increases; that there is a limiting current density (depending on the electrodes and electrolyte) below which decomposition does not take place; and that there is a limiting frequency above which decomposition does not take place. Polarisation is considered as represented by a curve of half the frequency of the current curve, and to have an effect equivalent to self-induction, for which views there does not seem to be much justification. He also came to the conclusion that decomposition cannot take place at an electrode unless the area is small enough to allow the fully-polarised condition to be reached with the current used, and thus it might be that decomposition takes place at one electrode and not at the other, giving rise to rectification. In 1893 Hopkinson, Wilson, and Lydall read a paper to the Royal Society in which a leading current due to polarisation is well shown, and the conclusion is reached that about one-tenth of a coulomb is enough to fully polarise 150 square centimetres of platinum in dilute sulphuric acid. In 1895 Peukert described experiments in which he had been unable to find any phase difference. Dolivo-Dobrowolsky pointed out that these experiments were inconclusive, that he himself had obtained large phase differences, and that polarisation should be equivalent to capacity. M. Wein supposed an electrolytic cell to be equivalent to a resistance in series with a capacity, but he found the

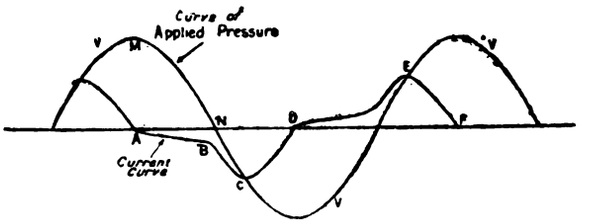


FIG. 1.

resistance required to be higher than that calculated from the dimensions of the cell and conductivity of the electrolyte. Oliveri, by plotting experimental curves, found evidence of various stages of polarisation, and that when the polarisation is slight a voltameter acts like a condenser. Investigations have been carried out by A. Franchetti on polarisation considered as capacity, and by Warburg and Strasser on the behaviour of unpolarisable electrodes. That part of the subject depending on Faraday's laws has been investigated by Malagoli, by E Wilson, and by Le Blanc and Schick.

It is, however, rather with the physical side of the question that we are concerned for the moment. Any experimental curves in the investigations to which we have referred were obtained by a Joubert contact disc. This method is laborious, and of necessity only approximate. It therefore occurred to the author that more exact information might be obtained by oscillograph records, and that some contradictory views might perhaps be cleared up in that way. About a year and a half ago Mr. W. Duddell kindly lent a double oscillograph to the author, and a number of photographic records were obtained, some of which are here reproduced. It has generally been assumed that polarisation is equivalent to capacity, so that it may be worth while to compare briefly the two quantities.

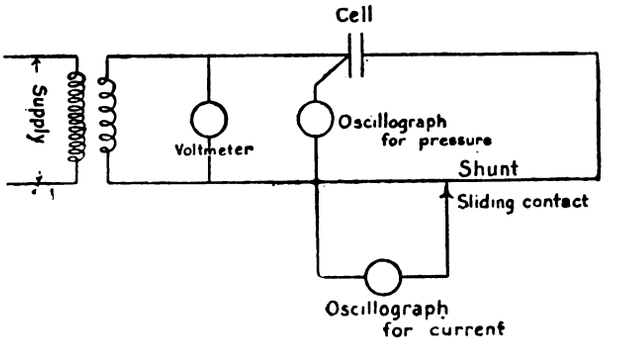

FIG. 2.

Suppose we assume that a sine current is flowing through a resistance, R, in series with a condenser of capacity K. The current, assuming that it is a sine curve, may be expressed as

$$A = A_0 \sin p\ t,$$

in which A is the current at any time t, A_0 is the maximum value of A, and $p = 2\pi n$, where n is the frequency, as usual. In order to find the expression for the volts which must be impressed on the circuit, we know that the component necessary for resistance must be equal to R A, in phase with the current. As to the component necessary for the capacity, we know that if V volts are applied to the terminals of a condenser having a capacity of K farads,

* Paper read before the Faraday Society, Oct. 13.

Digitized by Google

the number of coulombs, Q, with which the condenser will be charged is given by the equation

$$Q = K V \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

from which we have, by differentiation,

$$\frac{dQ}{dt} = K \frac{dV}{dt}.$$

Since $\frac{dQ}{dt}$ is the number of coulombs per second, it is the current that is flowing, or A, so that we have

$$A_0 \sin p t = K \frac{dV}{dt} \quad . \quad . \quad . \quad . \quad . \quad (2)$$

Hence if the pressure at the terminals of the condenser is to be a sine function like the current, we have the current derived from the first differential of the pressure, so that one must be in quarter phase with the other. By completing the investigation we know that this component is a quarter of a period behind, so that the resultant is displaced in the same direction and the current appears to lead

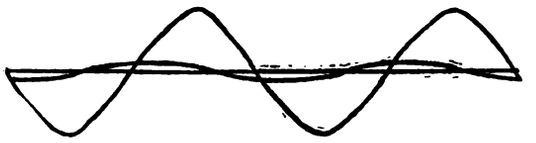

FIG. 3.—Applied Pressure, R.M.S., .03 Volt

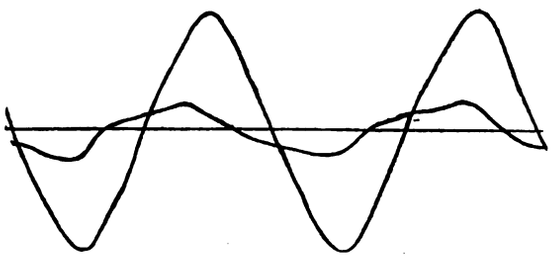

FIG. 4.—Applied Pressure, R.M.S., 0.5 Volt

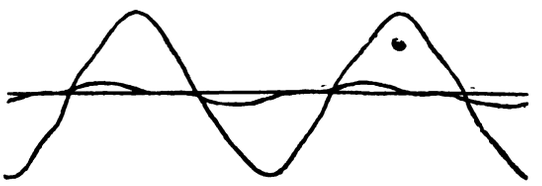

FIG. 5.—Applied Pressure, R.M.S., 0·65 Volt.

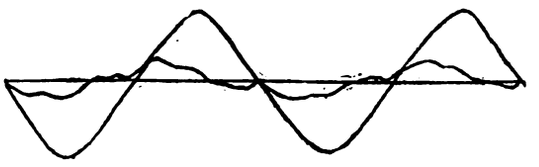

FIG. 6.—Applied Pressure, R.M.S., 1·0 Volt

If, now, we turn to polarisation, we have electrodes, each of a certain area, a, and if it is assumed that the products of decomposition are not removed by diffusion or otherwise, we may say that the polarisation is proportional to the quantity of electricity passing from the time that the current is zero up to a certain limit, and that a back E M F. of one volt results when a certain quantity, q, per square centimetre has passed, this quantity depending, of course, on the nature of electrodes and electrolyte. If, now, a pressure, V, is applied to the terminals of a voltameter, such pressure being below the limit of polarisation, then the quantity of electricity, Q, which passes is given by

$$Q = q a V,$$

which is an equation of the same form as equation (1) for capacity. Further, if it can be assumed that the behaviour is the same for a falling as for a rising current, we have

$$\text{current} = \frac{dQ}{dt} = q a \frac{dV}{dt},$$

which is of the same form as equation (2), and shows that this component is in quadrature with the current. This might be put otherwise. If P is the polarisation in volts and a current $A_0 \sin p t$ is flowing, then, since P is proportional to the quantity of electricity passing as the current rises, we have

$$P = - b \int A_0 \sin p t,$$

in which b is a constant, or

$$\frac{dP}{dt} = - b A_0 \sin p t,$$

so that the component for polarisation is in quarter phase with the current.

Unfortunately, we have no right to assume that the current is given by a sine curve, and we think this assumption has led to wrong conclusions in some of the investigations referred to. The applied pressure may be a sine

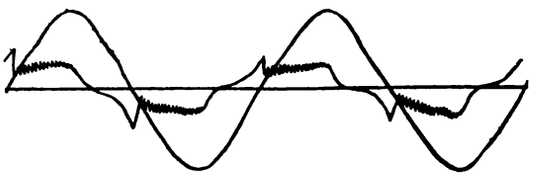

FIG. 7.—Applied Pressure, R.M.S., 1·15 Volts.

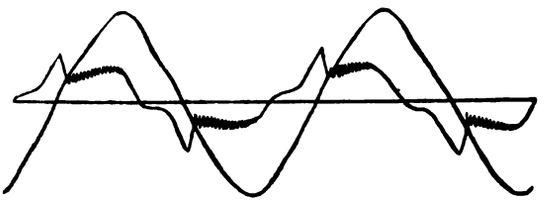

FIG. 8.—Applied Pressure, R.M.S., 1·3 Volts.

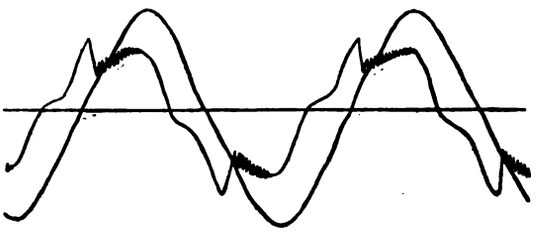

FIG. 9.—Applied Pressure, R.M.S., 1·5 Volts.

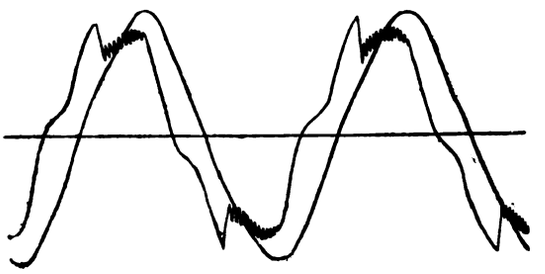

FIG. 10.—Applied Pressure, R.M.S. 1·8 Volts

curve, and if polarisation acted like capacity the current might also be a sine curve. But although polarisation may rise as rapidly as the current giving rise to it, in the same way as a condenser is charged as rapidly as the potential difference applied to it rises, there is not a corresponding behaviour as the current falls. In the case of a condenser the discharge follows the fall of the potential difference—there is no lag for all practical purposes. But in the case of a voltameter the polarisation does not discharge itself rapidly; in fact, it is a slow process. Consequently, when the applied potential difference fails, the E M.F. of polarisation remains and falls but slowly, because its fall depends upon voltaic action such as occurs in a gas cell, and this can only take place slowly under the circumstances. Therefore, polarisation acts as a sort of one-sided condenser, which is normal in charging, but refuses to discharge, except slowly, until forced to by a reverse charge. Moreover, it acts as a leaky condenser; the higher the applied potential difference the greater the leakage, until

Digitized by Google

finally the back E.M.F. rises no further, and visible decomposition takes place.

It is, therefore, evident that we should not be justified in assuming a sine curve for the current under circumstances where much phase difference is to be expected. Perhaps the simplest course is to assume a sine curve for the applied pressure and then to construct a curve for the current. In order to simplify matters we will assume that the resistance is negligible, so that any pressure in phase with the current may be neglected, and we will take the case in which the maximum value of the applied pressure is below the limit of polarisation, and in which the electrodes are proportioned to get polarised up to the applied pressure. Let V (Fig. 1) be the sine curve of applied pressure. Then a current will flow as V rises, but it will become less and less as the maximum is approached, and will become zero when V is a maximum, because V will be balanced by the polarisation. Thus the current will be zero at the point A. As the pressure falls from M to N it will be below the E M.F. of polarisation; there will be excess of E.M.F. in the reverse direction to the applied pressure, and, therefore, a negative current will flow, but as it depends on voltaic action the current will be small, and indicated in the figure, we will suppose, by A B. But when the applied pressure becomes negative after the point N, it will be acting in the same direction as the residual polarisation, and there will be a rapid rise of current. This will wipe out the residual polarisation, after which the polarisation will reverse, and the current, after rising to a maximum, will fall to zero when V reaches a maximum negative value, so that this part of the current curve is something like B C D. The curve is then repeated in the positive sense, giving the curve A B C D E F for a complete wave. It will be seen that the curve is not a sine curve, and that it is leading by a quarter of a period. If the resistance of the cell is important, the phase difference is, of course, less than a quarter period. This is equally so if the applied pressure exceeds the back E.M.F. of polarisation, for the current then is not zero when the applied pressure is a maximum.

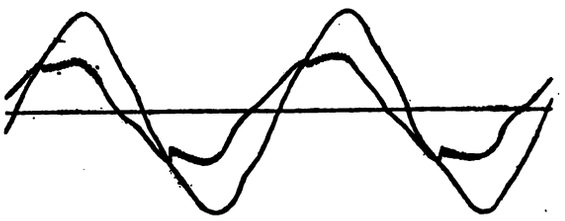

FIG. 11.—Applied Pressure, R.M.S., 2·2 Volts. A small bubble of gas noticeable on each electrode.

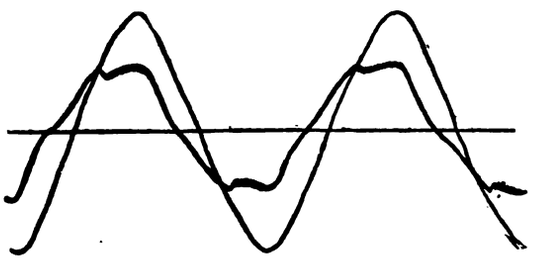

FIG 12.—Applied Pressure, R.M.S., 2·6 Volts.

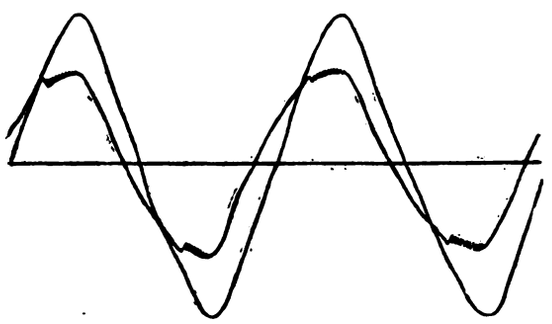

FIG 13.—Applied Pressure, R.M.S., 3·2 Volts.

In the oscillograph experiments the apparatus was connected up as shown in Fig. 2. An adjustable transformer was used so that the required pressure could be obtained by a simple adjustment without inserting any resistance. Current was taken from the mains of the London Electric Supply Corporation, so that the frequency was about 83 per second. A non-inductive shunt, consisting of a length of manganese wire, was used for varying the sensitiveness of the oscillograph for current, and this was adjusted by a sliding contact. As a large phase difference was desired small electrodes were used, so that they would be rapidly polarised. They consisted of platinum wires, 0·18mm. in diameter, projecting out of glass tubes into which they were sealed. The wires projected (and were, therefore, immersed) 2cm., and they were placed 3·2cm. apart. The electrolyte was dilute sulphuric acid of specific gravity 1·130. The results obtained are reproduced in Figs. 3-16, in which the larger curves refer to pressure and the smaller to current. From these it will be seen that the current curves are of the general form arrived at in Fig. 1. At very low pressures this is not so noticeable, although the phase difference approaches a quarter period. But in Fig. 5, referring to a pressure of 0·65 volt, the smaliness of the current in the first and third quarters of its period is clearly seen. In Fig. 6 it is still more marked. At higher pressures there is a very marked variation of the current as the pressure passes through the zero value, the cause of which is not clear. It may possibly have something to do with the fact that the surface of the electrodes was very small, and that in such a case the polarisation would reverse very soon after the pressure, or it may be that there is a sudden increase of resistance due to a layer of gas on the electrodes (abnormally high resistance was noted by M. Wien). This effect does not begin to disappear until products of decomposition are apparent, as in Fig. 11, with a pressure of 2·2 volts. As the pressure is further increased the current curve becomes more and more like a sine curve, and the phase difference diminishes as would be expected.

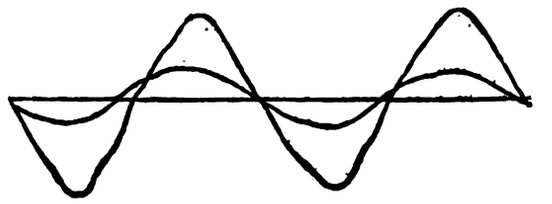

FIG. 14.—Applied Pressure, R.M.S., 3·85 Volts. Gassing just noticeable.

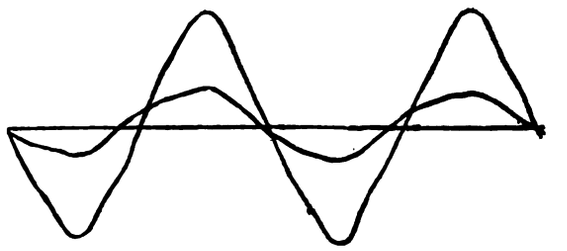

FIG. 15.—Applied Pressure, R.M.S. 5·0 Volts.

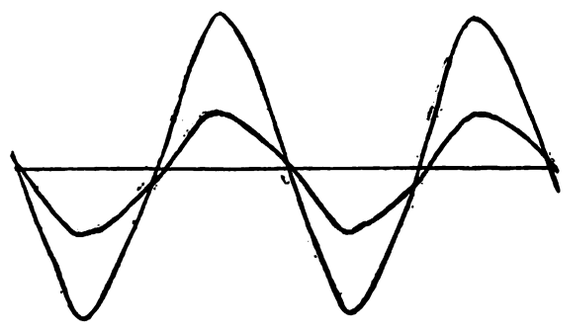

FIG. 16.—Applied Pressure, R.M.S. something above 5 Volts (too high for Voltmeter to be left in circuit). Gassing freely.

The same experiments repeated with platinum sheet electrode, each with an exposed area of about 110 square centimetres (the backs were varnished), gave current curves

Digitized by Google

which were much more regular and more like sine curves, though with some phase difference. It is, therefore, evident that experiments on alternate-current electrolysis are not necessarily comparable unless the electrodes are similar. The author also obtained records when a small induction coil was used as a source of current, from which it appears that phase difference may be produced. This is of some importance because a coil is used in measuring electrolytic resistance by Kohlrausch's method, and if there is phase difference an error will be introduced.

CONSTRUCTION OF CANADIAN NIAGARA POWER COMPANY'S 100,000-H.P. HYDRO-ELECTRIC PLANT AT NIAGARA FALLS, ONT.*

BY CECIL B SMITH, MA.E, M CAN SOC C E.

(Concluded from page 601.)

Transformer Station, etc.—On the tableland, immediately west of its works, the company has acquired a large tract of land, and on it has been built a transformer station of 25,000 h.p. capacity, 80ft. wide by 120ft. long, having a main central room 38ft. wide equipped with a 15-ton Whiting electric travelling crane, copper oil tank, suction pump and motor, and cast-iron jack rails, resting on concrete foundations. On these rails there has been installed, for the present, 12 transformers of 15,000 kw. total capacity, fully equipped with water-cooling, drainage, and lead-lined oil drainage systems. These transformers are for 40,000 or 60,000 volt transmission, and are separated from the low-tension and high-tension switchboards by solid brick curtain walls, the cables being brought to the transformers through passages underneath the concrete floors and carried from them through overhead arches in the curtain wall, thence to the high-tension switches, from which the wires will pass out of the building through specially designed windows. The building itself is of pressed brick, with stone sills and Ludowici tile roof, and is entirely fireproof, except window frames It has a central monitor roof for light and offices near the front entrance, which is a door of capacity for fully loaded freight cars to enter far enough to transfer loads to the crane. Adjacent to this station has been built a stand-pipe 30ft diameter by 116ft. high, which is connected to the main water system, from wheel-pit to transformer station, and the flow of water from which is controlled by a motor-driven valve operated from the transformer station, the object of which is that in case of fire the stand-pipe can be cut out, and the two pumps at the wheel-pit, by working tandem, can raise the pressure of water to 120lb. at transformer station floor line during the fire period. The function of this stand-pipe, however, is purely one of reserve in case of a breakage of the pumping and pipe systems supplying the transformers with water for cooling, in which event the stand-pipe capacity is estimated as being sufficient for 50,000 h.p. for 24 hours, or for 48 hours for the present station. In view of the importance of continuity of operation, this safeguard, although costly, was considered necessary; indeed, speaking of the equipment in general, every effort was made to design the plant so as to obtain a maximum of reserve in cases of breakdown.

Power-House Machinery.—For handling materials two 50-ton four-motor electric travelling cranes were installed, which, by working with a carrier, can together handle practically 100 tons. These cranes operate with 125-volt direct current, and have auxiliary five-ton hooks for fast service and light loads. The Sellers cranes, which are the ones here used, have, as a distinctive feature, fixed drums, the carriage only travelling. The speed requirements with full loads were: main hook, 10ft. per minute; auxiliary hook, 50ft. per minute; trolley travel, 25ft. to 50ft. per minute; and bridge travel, 200ft. per minute. The main turbines have twin draught tubes emerging into the sides of the pit immediately above the invert, and, owing to the great depth of water which there will be normally in the pit with the whole plant in operation, not to speak of the effect of back water during high water in the lower river, it was necessary to locate the turbines about 47ft. above the invert of the tunnel, and although air pressure is equivalent to about 33ft. water head, it has not been found practicable to operate safely with more than 25ft. of draught tube effect, which necessitated some artificial means of creating a pondage in the wheel-pit with only a few wheels in operation. The result was obtained by installing a huge regulating lift gate at the extreme lower end of wheel-pit, where connection is made with the tunnel, and operating the same by lift screws, overhead girder, and 85-h.p. 125-volt direct-current motor (a second motor in reserve. The water will pass under the gate, and in order to resist the constant vibration very heavy cast-iron grooves grouted and bolted into the brick lining walls of the wheel-pit rest against masonry specially cut and built into these walls to receive the grooves, and the gate is equipped with an oiling system fed from a flexible piping. The 10,000-h.p. turbines are described as twin inward discharge, Francis type, operating at 250 r.p.m. under 136ft. net effective head, and have solid bronze runners 5ft. diameter, and cylinder gates, controlled each by four racks and pinions. The racks move on opposite sides of the pinions, so that one gate rises as the mate to it lowers, the whole movement for each unit being controlled by a connecting road from the Escher-Wyss governor situated on the power-house floor.

The revolving parts of a turbine and generator, and the shaft connecting them, are supported as follows: in addition to the upward thrust on the lower runner, there is a balancing piston located immediately above the wheel case, and the piston for each unit is directly supplied with water from the forebay by a 12in. pipe, but as a reserve, in case of accident, there is also a connection with each penstock. In addition to this there is attached to each main shaft immediately beneath the generator a thrust bearing, capable, when operated with high-pressure oil, of carrying the whole weight of the revolving parts of a unit, which amounts to about 243,000lb. This bearing is fed from the oil chamber with oil, which is raised to a high pressure by a pump located immediately alongside on the thrust deck; after leaving the bearing the oil flows back to the chamber to be cooled, clarified, and pumped back again to the thrust deck. The turbine shafts are hollow seamless cylinders 40in. in diameter, with weldless flanges, which connect by couplings to nickel steel bearing shafts 14in. diameter, bored out 8in., at the various bearings and connections, there being two intermediate bearings for supporting the shaft between the thrust bearing and balancing piston. The main penstocks each consist of a lower cast-steel elbow in two sections, weighing 49 tons, which sits astride of the pit and carries the weight of the penstock and the water contained therein; above this are five straight sections of riveted pipe 10ft. 2½in. in diameter, having weldless steel flanges, and an expansion joint connecting to the cast-iron mouthpieces in wheel-pit wall by a steel upper elbow. The calculated speed of the water with full load on a unit is about 11ft. per second. Five units of 7,500 kw. output each makes the present installation, but the plant is built for 11 such machines, the eleventh being counted a spare, and in order to increase the present output it will only be necessary to extend the power-house building and install such machinery as may be required.

For supplying the various water-driven machines in the chambers, an independent water system has been installed, which consist of a 36in. riveted main with weldless flanges along the rack deck, fed from the canal by two 36in. and five 24in. vertical pipes. Of these one 36in. and two 24in. pipes are in the first installation. From this main, which is sub-divided by valves at various points, rising pipes enter the chambers, and after operating the machines, the water passes by draught tubes into the tailrace below. In one chamber is located an exciter plant making 125-volt direct current, which is used not only for excitation of large generators, but for operating cranes, switches, various gate and pump motors, and lights, etc. This plant consists of three vertical direct-connected units of 332 h.p. each, the turbines being single, spiral case, inward and downward discharge, running at 600 r.p.m. under 131ft. head, and controlled by Lombard governors. These units have oil bearings, sup-

* Abstract of paper read before the Canadian Society of Civil Engineers.

Digitized by Google

plied with low-pressure oil from the oil chamber, and are each quite independent, so that any unit can run with the other two shut down for repairs. In a second chamber are located two pump units. Each unit consists of a horizontal turbine direct connected to a centrifugal pump of 3,000,000 gallons per 24 hours capacity. These pumps can, as before remarked, be run in tandem in case of fire so as produce a fire pressure at the transformer station of 120lb., with a pressure at the pump of 210lb. per square inch. The turbines are driven from the 36in. auxiliary main and discharge into the tailrace by draught tubes built into the brick wheel-pit lining, while the pumps draw their water from one of the 24in. supply pipes from the canal, and discharge by a 24in. pipe up the wheel-pit, and thence out and to the transformer station, a half-mile distant, by a 12in. water-main. In a third chamber there is a very complicated system of motor and Pelton driven Quimby screw oil-pumps, oil-tanks, filter tanks, and cooling tanks, all so interconnected as to produce necessary circulation, which consists, briefly, in there being two circuits, one for low-pressure and one for high-pressure oil. The oil traverses from a machine back to the cooling and filter tanks, thence to the suction tanks, from which it is again pumped back to the machine. The high-pressure oil is handled in the same manner, except that a special pump is located at each thrust bearing, and raises the oil pressure at these bearings, after which this oil also flows back to the oil chamber to be cooled and clarified. In this chamber is also a specially designed Pelton-driven air-compressor, and in a chamber on the upper level adjacent to the main subway are located storage tanks of large capacity for storing oil, while a pressure oil tank is also located in the roof of the power-house.

The main power-house floor will contain only three items of equipment—namely, the 7,500-kw. generators, the turbine governors, and the main switchboard. So that the view from the visitors' gallery will be one of extreme simplicity, as the armatures of the generators are external and stationary, and the governors are very innocent-looking machines in line with the generators, and not observable from the north end of the power-house. The generators are about 18ft. in diameter, with internal revolving fields, and deliver three-phase 25-cycle current at 12,000 volts, which was adopted in order to enable local distribution for several miles to be made without transforming. As these generators were both too large and too heavy for transportation, it was necessary to have them completely assembled at the shops, then taken apart and packed in hundreds of boxes, and shipped knocked down to the works, where it took several months to rebuild the fields and armatures piece by piece, there being, it is understood, 47,000 punchings in each armature. There are two subways just below the power-house floor, one to the right being for cables, and the main one to the left for cables and for the substructure of the main switchboard, which for each 50,000 h.p. is about 150ft. long. The subway itself runs the full 600ft. length of the plant, and has a series of chambers opening off to the left, one at each inlet breast wall, which will be devoted to miscellaneous purposes, such as location for small transformers, etc. The main switchboard consists of a lower part in the subway, made up of 'bus-bar compartments, divided up vertically by brick walls and horizontally by soapstone slabs, and containing motor-operated oil switches, and above the power-house floor the switchboard proper, from the gallery of which a full view of the power-house is had, and which is equipped with switches necessary for full control of the station. Cables leave the power-house by three manholes—one situated at each end and one at the west side—from whence they pass through conduits, already described, either to the transformer station or to Niagara Falls, N.Y., to deliver current supplementary to that generated by the Niagara Falls Power Company. These cables are lead covered, 2½in. diameter, and contain three-phase 19-strand copper conductors, each ½in. diameter, which are insulated by paper and gum wrappings, the whole three being again insulated by similar wrappings beneath the lead covering.

The ground for this plant was broken in September, 1901, although the tunnel and cofferdam had been nominally commenced somewhat earlier, and water was turned into the forebay Nov. 9, 1904, the exciter chamber was ready for operation Nov. 24, 1904, and the first 10,000-h.p. unit Dec. 23, 1904—while two 10,000-h.p. units were ready for operation Jan. 1, 1905. The third unit will be put in operation in a few months, and the fourth and fifth units during the summer of 1905, while the extension of wheel-pit complete, brick lined, and ready for the machinery of the remaining six units should be completed during 1905. It will be appreciated that during this period Queen Victoria Park, with two other large and one smaller plant under construction, was in a state of great chaos, and this is largely the case at the present time, but the companies are under obligations to place their respective areas in good condition as soon as construction is finished, and when this has been done the southern part of the park, which was always in a state of nature, will be vastly improved. The Canadian Niagara Power Company, in process of construction, filled in the foreshore of the river for about 100ft. in width from the Horseshoe Falls southward for over half a mile, and this will be also sodded and added to the park area.

The principal contractors connected with the works were: James Barry, cofferdam; Dawson and Riley, wheel-pit and canal; Queenston Quarry Company, arch bridge; A. C. Douglas, tunnel and portal; Wm. Grace Company, power-house; Brass Bros., transformer station; Escher, Wyss, and Co., turbine units Nos. 1, 2, 3; I. P. Morris Company, turbine units No. 4, 5; General Electric Company, generators and main switchboard; Jenckes Machine Company, exciter turbines; Westinghouse Electric and Manufacturing Company, exciter generators; Canadian General Electric Company, transformers; Canada Foundry Company, various lift gates, etc.; Hamilton Bridge Company, power-house steelwork; in addition to which a great many contracts were placed in Canada and United States for various pipings, steel floors, smaller machinery, etc. The policy was at once established of having continuous and thorough inspection in keeping with the rigid specifications and high class of work demanded, and a large number of inspectors were employed, who were located at the various manufacturing centres and on the works itself. As these men were all the best that could be found for the various classes of work being done, it is believed that the results warrant the large attendant expenditure. For mill material the Pittsburg testing laboratory did the inspection.

For the complete study, design, and execution of such an undertaking as has just been described the engineering department was necessarily somewhat complex, there never having been any chief engineer, either nominal or actual, the organisation being as follows: chief mechanical engineer, Dr. Colman Sellers; consulting hydraulic engineer until Dec. 31, 1903, Clemens Herschel; consulting engineer until March 1, 1904, W. A. Brackenridge; resident engineer in charge of construction, Cecil B. Smith; electrical engineer, H. W. Buck. Speaking generally, the designing was done under the direction of consulting engineer Brackenridge and by the designing staff of the Niagara Falls Power Company, in charge of A. H. Van Cleve, until March, 1904, since which time the writer assumed Mr. Brackenridge's functions; but the liberal policy of the company was that all the main points of design were determined after full discussion by the various engineers mentioned.

In carrying on the work of construction the company allowed the writer full choice of whatever staff was considered necessary, and to employ also such inspectors in different branches as were needed. The chief assistants were as follows: principal assistant engineer, G. A. McCarthy; assistant mechanical engineer, C. C. Egbert; assistant electrical engineer, G. E. Brown; assistant engineer of wheel-pit and canal, Wm. Macphail; assistant engineer of tunnel, L. Sherwood. To these gentlemen the writer wishes to here tender his extreme appreciation of those qualities which made it possible to carry on such an extensive work with satisfactory results, and in that harmonious spirit which prevailed from the commencement of the work until the time (December, 1904) when the writer completed his engagement with the company.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

Post Free, Payable in Advance.)

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-year's copies, bound in Dark-Blue Cloth, Gold-Lettered, price 8s. 6d. New Volume, January to June, 1905, now ready.*

THE L.G.B. AND ELECTRICAL UNDERTAKINGS.

Government in this country is a mysterious matter, whether it concerns Imperial or local affairs. The latter is the concern of the moment. Broadly speaking, it is based upon the idea that those who pay the piper may call the tune, and it is difficult to improve upon that idea. That idea, however, is merely in the abstract; when we come to consider actualities the case is altogether different. Many good reasons can be assigned for the anomalies which exist, though some of these anomalies are so atrociously bad that no possible reason can be given for their existence. To follow the question of local self-government through all its phases would require an encyclopædia, hence we shall refer only to what concerns us at the moment. Legislation compels local authorities to do certain work, it permits them to do other work. Of late years, as our readers well know, local authorities have largely embarked in work of a trading or semi-trading character. If the authority likes to raise money by, say, increasing the rates so that the income from that source is always sufficient to meet the expenditure involved the Local Government Board have no finger in the pie, but if the undertakers want to borrow money—that is, to contract a loan—the Local Government Board has its say in the matter. Roughly, the course of procedure followed is that a majority of a council becomes convinced that it will be for the benefit of the constituency to embark in certain operations, say the installation of an electrical undertaking. This majority having carried their point in council, the matter is put into the hands of a committee. Investigation as to how the thing will be taken up by users is made, plans are prepared, the cost is estimated, the plans are submitted to the Local Government Board for approval, and sanction is also sought for the loan required. Assume for a moment that the very best advice is sought and obtained by the committee. The engineer who advises has to consider immediate requirements, and immediate future requirements. He must look ahead, but not too far ahead. If he does the latter, and in his plans provides for a quarter of a century in advance, he is uncertain whether improvements will not come along before that period has more than partly elapsed to render nugatory a part or the whole of his design, and so he may saddle the authority with a huge expenditure that acts like a nether millstone round the neck of a drowning man. On the contrary, he may be too nervous to look enough ahead, and his designs may very soon prove defective because of their inflexibility to cope with the demands made upon them. Fortunately or unfortunately, just according to the man and from the point of view the matter is considered, many of the undertakings of local authorities have been installed under the condition of too little looking ahead, hence extensions and alterations have soon become necessary. Of course, extensions mean more expenditure and further recourse for the approval of the Local Government Board. The engineer is not always—indeed, not often—to blame in this matter, because the moment any section of a council suggests a certain course of action the opposition is up in arms, hence compelling a very close attention to what is spent, and too frequently partly spoiling the ship for a ha'porth of tar. So far we have touched upon the local authorities' share of the business. We have now to refer to that of the Local Government Board's. In the first place, it has to agree as to the suitability of the plans for the proposed work; secondly, to sanction the loan required. Generally, an inspector of the Board makes a local inquiry to hear opinions for and against the scheme, and after due consideration of all that has been heard sanction is given or withheld. We

Digitized by Google

are not trying to devise a better system. We are not even criticising the system adversely, but after this brief history of the system we are going to condemn root and branch the view which seems to have lately taken root in the minds of some inspectors, that it is their duty to consider the question municipality *v.* company, or to base their decisions upon other phases of work that at the moment are not forward for consideration. The number of cases in which it is deliberately stated that inspectors are hardly considering the question upon its merits is becoming alarmingly great. Let us just refer to one or two. Take Torquay. In our issue of March 25, 1898, and p. 366 is this sentence: "Outside observers, however, while acknowledging that the engineer has made the best of the site at his disposal, are inclined to the opinion that, if the demand increases as the speakers expected, troubles about extension would arise from the constricted area." At that time electric trams were not on the card. Since then they have come on—demand has increased, and extensions are wanted. Again, because of the constricted site, outsiders think no tinkering with the present station will be satisfactory. The Council were prepared to spend some forty odd thousand pounds on a new station elsewhere. The loan required by the Council did not obtain the approval of the Local Government Board. The present question is as to its attitude regarding a smaller loan for some nine thousand for tinkering with the works upon this constricted site. A report of the inquiry elsewhere in this issue shows that the work contemplated would only tide over the demand for a few years. The inspector suggested that the alternative of selling the whole undertaking to the Dolter Tramway Company should have been considered. Now take Rochdale. Here the inspector took exception to the granting of borrowing power for the electricity works because the tramways were not financially successful. What that had to do with the inspector is a mystery. The tramway undertaking is a separate undertaking, though belonging to the Council. Then the tramways were in process of conversion, and the question of financial success or otherwise could not possibly be known. The electricity undertaking wanted a loan for extensions to supply the trams at a price we are credibly informed would have paid the electricity suppliers. In the end the loan has been granted, but we are told not till the Local Government Board had written the Rochdale Corporation suggesting the consideration of taking supply in bulk. Is that a suggestion that should emanate from the Local Government Board? Must we understand that the Rochdale advisers had not considered the point before giving their advice, and is it not a fact that even had the Corporation sold their tramway undertaking to a company the supply must have been from the electricity works, because the feeders are designed and laid for that purpose, or all that expenditure wasted? In view of the above facts, and of troubles over loans at many other places, we question how far the opinions expressed at these inquiries are those of the Local Government Board and how far they are the personal and, in our opinion, mistaken view of the gentleman occupying the inspector's chair as to the scope of his powers.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

N.E.R. ELECTRIFICATION.

SIR,—As several misleading reports have appeared in various newspapers with regard to the fire at the North-Eastern Railway Company's transforming station on Saturday night last, we beg to give you below a copy of the official report of the occurrence supplied to the local Press by the North-Eastern Railway Company:

"The North-Eastern Railway transforming station at Wallsend, at which a small fire occurred on Saturday night, was running again first thing yesterday morning, though this was not necessary to enable the trains to run, as these were running from the other sub-stations an hour after the breakdown, and as soon as the cause of the trouble was discovered. The total time of failure of the train service was about an hour. The accident at the transforming station at Wallsend occurred in the following manner: The contractors to the railway company for the erection of the sub-stations were making preparations for some final tests on the machinery which they had supplied. In order to carry out these tests they erected some temporary cables. During the progress of preliminary tests these temporary cables fused and set fire to several other cables which were used for feeding the railway. The actual damage by the fire is insignificant, and none of the machinery was burnt in any way. The train service would not have been delayed even for an hour if it had not been that, unfortunately, the telephone box was the chief thing that caught fire, and could not be used. It was rumoured on Saturday night that the fire had occurred at Carville power station, but this was incorrect."—Yours, etc.,

M. SHORT, Secretary,
(For the Newcastle-upon-Tyne Electric Supply Company).

COLNE AND TRAWDEN LIGHT RAILWAYS.

SIR,—In your issue of the 20th inst. you refer to the above company's undertaking under the title "Nelson Light Railways," and say, "the Burnley Corporation run through cars, *and now that the Colne and Trawden Light Railway Company have completed their lines* the Nelson Corporation have again approached the company with a view to inter-running." So far as the Colne and Trawden Light Railways Company having completed their lines, the statement is not correct, as there is still a section of railway incomplete, but it is under construction, and with favourable weather and circumstances it should be completed within the current year. Kindly correct the statement in a future issue.—Yours, etc.,

J. H. RHODES (the Company's Engineer).

A PLEA FOR ENLIGHTENMENT.

SIR,—It seems to me time is ripe for a discussion on the relative merits of the different types of tramcars now in vogue. The tendency in this country since electric traction was introduced to increase the carrying capacity per car has been very marked, but it is open to question whether there has been a proportionate gain. Is not the two-deck covered-top monstrosity of to-day rather a huge mistake? True, the earning capacity of this type of car is greater than that of the single-decker during periods of maximum traffic, but the extra dead weight which is involved at all times tends to balance matters. Moreover, increased initial expenditure is necessitated by the use of these heavy cars. The rails must be heavier in proportion, and the whole permanent way of more solid construction. Then there is the extra wear and tear of the track to be considered, and the greater stresses which the car trucks are called upon to withstand, not to mention the increased vibration and consequent noise due to concentrated weight at yielding joints. It is significant to note that Continental engineers have not followed this country's lead. On the contrary, they have, for the most part, adopted a type of motorcar differing little in size from the single-deck horse cars displaced, the necessary extra seating accommodation during periods of heavy traffic being provided by trailers. Thus the carrying capacity of their systems can be varied within wide limits without altering the frequency of the service. At the same time it must be admitted that these small single-deck motorcars and trailers entail the provision of increased car-shed accommodation, and more of them being required to deal with a given number of passengers, the initial cost of the rolling-stock is also greater. I have

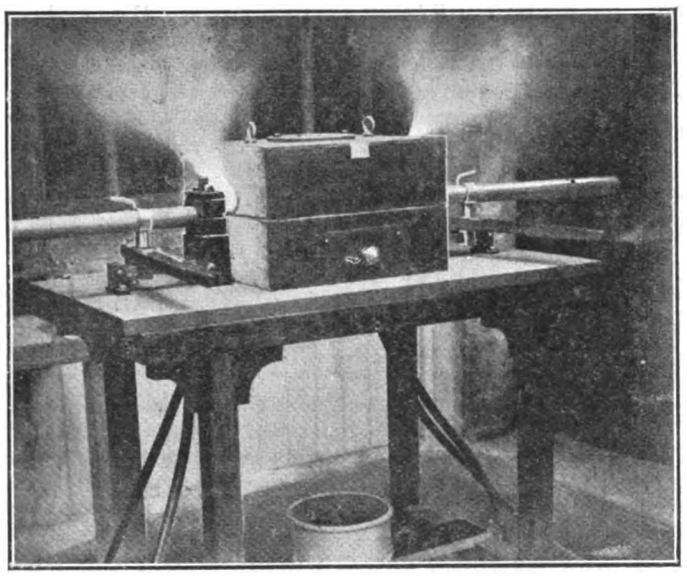
Digitized by Google

had no experience with the two deck covered-top type of car, and, therefore, venture to ask those of your readers who have had opportunities of comparing the results obtained in actual practice to state their conclusions. A little more ventilation of the subject would certainly be widely appreciated. Many, I feel sure, like myself, are open to conviction that the two-deck, top-covered type of car is well suited to the conditions here prevailing, but lack reliable data on which to base their judgment.—Yours, etc.,

DUBIOUS.

ELECTRICAL FURNACES—MOISSAN.

The electrical furnace which attracted so much attention at the Olympia Exhibition is, as was announced last week, to be used for educational work at Glasgow. The illustration which we give of this furnace herewith will remind our readers of the Marryat and Place interesting experiments. For this furnace a special 200-kw. service was laid to the exhibition. For most of the experiments shown a current of 50 amperes is sufficient, but for some as much as 1,000 amperes 200 volts is employed. The furnace is of the Moissan type, and permits of easy modification in various ways for different classes of experiment. The lining is of magnesia and carbon, and is renewed daily. The electrodes are of round carbon, 2in. by 36in, and a convenient arrangement of the holders allows the arc to be instantly extended from contact to 14in. Temperatures can be obtained up to 4,000deg. C. (7,232deg. F.), at which point all known substances volatilise. A Féry pyrometer has been



fitted up for checking the temperatures between 1,600deg. and 4,000deg. C. A feature of this type of furnace is the ellipsoidal roof cavity, which acts as a reflector, condensing the heat rays from the arc upon the crucible below. Even though the roof may be fusing rapidly, the fused material runs down the sides, and does not drop into the crucible, and the shape of the reflector remains the same long enough for the experiment to be performed.

GLASGOW LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS.

The Glasgow Local Section of the Institution of Electrical Engineers had their fourth annual dinner in the Grosvenor Restaurant on Friday, Oct. 27. The chairman, Mr. J. M. M. Munro, presided over a company numbering fully 200. There were present, among others, Sir John Ure Primrose, Lord Kingsburgh, Sir John Shearer, Dr. Murray, Prof. Magnus Maclean, Ex-Bailie Mackenzie, Messrs. Neil Munro, W. W. Lackie, R. Kaye Gray, Wm. Wallace, LL.D., G. C. Lloyd, W. C. Warden, W. R. Copland, James Alexander, Thomas Wright, E. H. Parker, F. A. Newington, Colonel Young, etc.

After the usual loyal toasts, the CHAIRMAN called upon Sir John Shearer to propose "The Imperial Forces." He said that in the modern battleship practically all the machinery was electrically controlled. In spite of the many critics that their army had, he was sure that what had been done in the Peninsula and at Waterloo would be repeated if the occasion ever arose. He thought that if the Volunteer forces were to be efficient, the Government was in duty bound to see that adequate finances were forthcoming for that purpose. He did not think that conscription was necessary, but they should have a system of compulsory training.

The toast was coupled with the name of Lord KINGSBURGH, who, in reply, said that he expected to find the Glasgow Local Section a small and struggling body, and was agreeably surprised to find himself in such a large assemblage, composed as it was of gentlemen who seemed to be very successful in their profession. He himself was an old member of the Institution of Electrical Engineers. He remembered reading an article in his youth in which the idea of getting power for industrial purposes from electricity was denounced as preposterous. He was told that Liebig had said so. No; it was Bunsen that had said so, and he had proved conclusively that electricity could never be commercially successful because zinc cost so much a pound. With regard to the toast, he was reminded that the first invention in the way of electricity was offered in 1816 by Ronald to the War Office of the day. It was an electric telegraph, but the reply of the War Office was that a telegraph was of no use in times of peace, and in war the semaphore was quite sufficient for all practical purposes. What had they come to now! What changes had taken place in the battleship during the last 100 years. What would Nelson say if he could be asked to step on board a modern warship? The speaker did not think he would care for it at all.

Ex-Bailie MACKENZIE, of Edinburgh, in proposing the "Lord Provost and Corporation of Glasgow," said that while the various undertakings of the Glasgow Corporation were the objects of admiration and even envy, he could not endorse some of the proposals which had been recently made, such as the purchase by the Corporation of a few coalpits, some quarries, and some brickfields. He was glad these proposals were only supported by 13 and opposed by 35. They hoped that something would be left to the individual to do besides paying rates. There was a danger that if they had 15,000 to 20,000 Corporation employés with votes, such voters might some day return men to the Council who would give them the highest wages for the minimum of work. It had been proposed that the Corporation should take over the public-houses. There would be no want of deputations then, for the members of the Town Council would need to see that the liquors kept in stock were of the proper quality.

Sir JOHN URE PRIMROSE, in reply, said that if the Corporation were to be precipitated into what was designated as a works committee to undertake all contracts, then they opened the possible door of Tammany, they limited individual effort, and inaugurated a system of collectivism that was not progress, but the destruction of progress. They would be well advised if they saw that they had men in the Town Council who recognised that they had an orbit of administration, and that did not include the carrying out of contracts which, in his opinion, a governing body should never undertake. He had been entrusted also with the duty of proposing the toast of "The Institution of Electrical Engineers." He would take the opportunity of warning them against one of the drawbacks of competition—the danger of sacrificing durability and the margin of safety to the demand for cheap work. They should try to establish and to justify public confidence by making all their work thorough, even though they lost an occasional contract thereby.

Mr. R. KAYE GRAY, of the parent institution, in reply, said that the President of the Institution of Electrical

Digitized by Google

Engineers was unable to be present, as he had just returned from South Africa. The president-elect also regretted his inability to be present with them. He thought the electrical industry in Glasgow was greatly indebted to the liberal spirit with which electrical enterprise had been treated by the Corporation. He had to propose the toast of "The Glasgow Local Section," which was recognised by the Council in London as one of the best local sections The papers sent in by its members were generally of a high order, and the Council had recognised their merit by awarding premiums for the best of them from year to year. He hoped that the Glasgow Section would persevere in its endeavour to form a students' section. They were aware that their Institution had a membership of 7,500, and surely it was very gratifying to know that such a large number of men should find employment in their profession in their restricted island home.

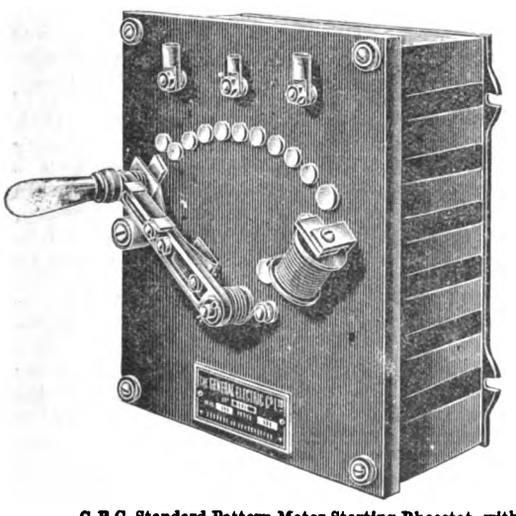
Mr. J. M. M. MUNRO, in reply, said that while hitherto they had had no lack of papers, he would like if everyone connected with the section would send in a paper to the secretary at the earliest possible moment. As the field of electrical engineering widened with the progress of science, until it seemed as if it would include everything that man may know of Nature and everything that he can accomplish in making use of the forces of Nature, it was obvious that they could accept compliments only in a spirit of humility, but that spirit, like another spirit with which they were familiar with in Glasgow, should not be taken in a form which paralysed, but in a form which stimulated.

Songs, etc, were contributed during the evening by members of the company.

TRADE NOTICES AND NOVELTIES

Engineering Supplies.

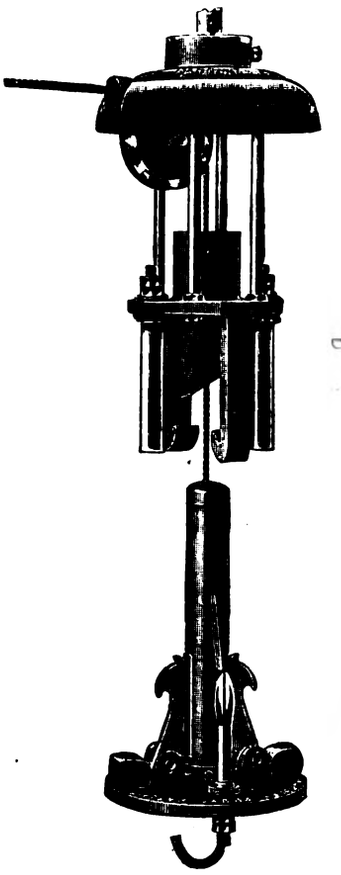
The new catalogue (Section E) of engineering supplies recently issued by the General Electric Company, Limited, Queen Victoria-street, E.C., deals with electric fans, blowers, small motors, motor starters, transformers, portable electric drilling machines, pumps, accumulators, traction supplies, etc. The pages devoted to small motors will be found especially useful, particulars of both continuous and alternating current types being given, also of small motor transformers for voltages varying from 100 up to 500. Full particulars and dimensions are given of several types of motor-starting rheostats to suit practically any condition of working. We have selected the firm's standard pattern with automatic no-voltage release for illustration herewith. Another item worthy of attention is the portable electric drilling machine, various patterns of which are illustrated, one being shown with flexible shaft. Polishing and grinding machines are also shown; these can either be fixed to the wall or bench. A pattern fitted with flexible shaft is also included. Accompanying is an illustration of this. Among the further contents of this catalogue are particulars and illustrations of reversible automatic lift controllers, including push-button controllers. The latter apparatus can be arranged for any number of floors, and dispenses with the lift attendant. The last pages are devoted to traction supplies of every description for the overhead system.



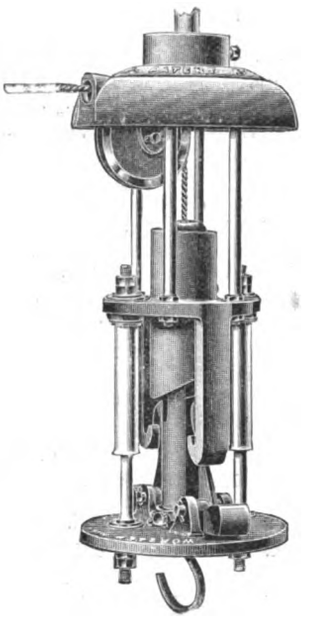
G.E.C. Standard Pattern Motor-Starting Rheostat, with Automatic No-Voltage Release.

Verity's Specialities.

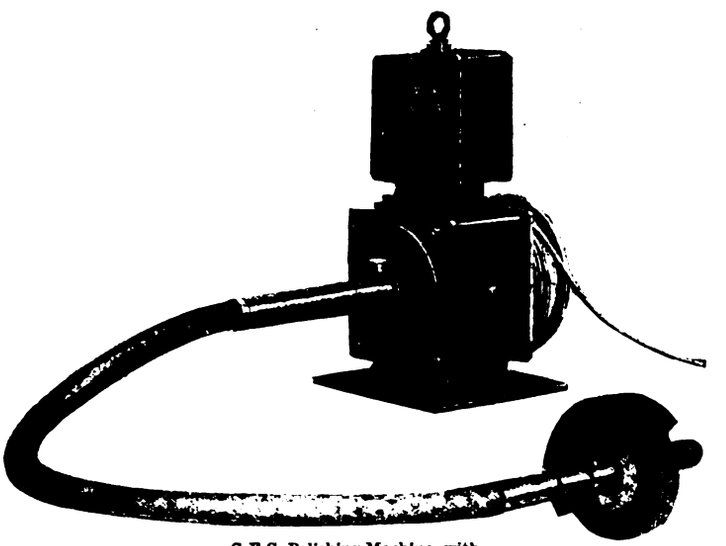
Accompanying are illustrations of the Aston-Worsley automatic clutch and contact. This device is designed for the easy manipulation of arc lamps suspended from brackets or lofty ceilings, so that by means of a winch and suspension cord they may be lowered to the ground to be trimmed and hauled up again into position without an unsightly festoon of cable. The contact gear is made to support a weight of over 1cwt., and is so arranged that when hauled up into position the whole weight of the lamp is taken off the cord and supported by hooks provided in the gear. The latter, it will be seen, consists of two parts—the upper part with a hooded dome, from which the supporting hooks depend, and the lower part on to which the lamp is attached. All the movable parts are contained on this lower half, so that should anything go out of gear at any time it can be lowered for attention at ground level. The device for hooking is very simple, consisting of two large hooks, which by gravity come into contact with two other hooks hanging from the top part, and a small catch-piece which is



The Aston-Worsley Automatic Clutch and Contact, showing the Top and Bottom Contacts about to engage.



The Aston-Worsley Automatic Clutch and Contact, showing the Clutch and Contact in use, the weight being taken off the cord.



G.E.C. Polishing Machine, with Flexible Shaft.

Digitized by Google

loosely fixed midway between the two movable hooks. This catch-piece only comes into play when the lower part of the contact gear is hauled up into position. When the gear is required to be lowered, a slight turn of the winch in the direction of hauling up is made, and then the hooks disengage, and the lamp or other article can be lowered to the ground. The contacts are specially large, and are of the plug type and self-cleaning. A neat cylinder effectively protects the gear from the weather. There are no springs or delicate parts in this gear to get out of order. The manufacturers are Messrs. Verity's Limited, of Aston, Birmingham, and Deansgate, Manchester, from whom we have particulars also of their various arc lamps. These include the Aston-Worsley enclosed type, which we understand has already established a good reputation, although quite a recent introduction.

Catalogues, etc., Received.

ENCLOSED ARC LAMPS.—The British Thomson-Houston Company, Limited, Rugby, have recently issued a new pamphlet dealing with their several types of enclosed arc lamps for continuous and alternating current circuits. The good qualities of these lamps have won for them an extensive demand, as is apparent from the illustrations included of a few installations put up.

ELECTRO-MEDICAL APPARATUS.—The General Electric Company, Limited, Queen Victoria-street, E.C., are issuing a neat little pamphlet containing particulars and illustrations of some of their electro-medical apparatus for hairdressers, chiropodists, manicurists, etc.

NOVELTY.—From the last-mentioned firm we also have samples of an attractive little novelty which they have brought out to advertise their "Robertson" Wytelite lamps. It takes the form of a whist-marker, and should be widely appreciated by lovers of the game.

FORTHCOMING EVENTS.

FRIDAY, NOV. 3.

Junior Institution of Engineers.—At 8 p.m. (at the Westminster Palace Hotel), presidential address by Mr. Dugald Clerk, M.I.C.E., on "The Problem of the Gas-Turbine."

Dr. Gisbert Kapp.—At Imperial Restaurant, dinner.

SATURDAY, NOV. 4.

Birmingham Electric Club.—At 7.30 p.m., "Electric Furnaces," by Mr. J. H. Stansbie.

MONDAY, NOV. 6.

Society of Engineers.—At 7.30 p.m. (United Service Institute). "The Metallic Preservation and Ornamentation of Iron and Steel," by Mr. Sherard Cowper-Coles.

TUESDAY, NOV. 7.

Institution of Civil Engineers.—At 8 p.m., inaugural address by Sir Alexander Binnie and presentation of awards.

THURSDAY, NOV. 9.

Institution of Electrical Engineers.—At 8 p.m., installation of president (Mr. J. Gavey, C.B.), who will deliver his inaugural address.

FRIDAY, NOV. 10.

Physical Society.—At 8 p.m., "Temperature and Efficiency of Thermal Radiation," by Mr. J. Swinburne; "Note on Constant-Deviation Prisms," by Mr. T. H. Blakesley.

Institution of Civil Engineers.—Nov. 14, at 8 p.m., "Waterways in Great Britain," by Mr. J. A. Saner, M.I.C.E.

APPOINTMENTS VACANT.

Electrician, Burnley Union. Wages, £2. 2s. per week. Applications by Nov. 15.

Premium Pupil, Electricity Works, Canterbury. See advertisement in last issue.

Switchboard Attendant, Southend Town Council electricity works. Salary, £1. 1s. per week.

Assistant Lecturer and Demonstrator in Electrical Engineering. Leeds University. Salary, £175 a year.

Wireman for electric light and power plant. Applications to Box 29, *Electrical Engineer* Office. See advertisement.

Representatives for an electrical contracting firm. Applications to Box G 33, *Electrical Engineer* Office. See advertisement.

Canvasser for a firm of electrical contractors in London. Applications to Box No. 514, *Electrical Engineer* Office. See advertisement.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sell's Advertising Offices, London, E.C.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office. See advertisement in last issue.

TORQUAY EXTENSIONS.

Second Local Government Board Inquiry.

On Tuesday last Mr. H. Ross Hooper, C.E., conducted a Local Government Board inquiry at Torquay into the application of the Town Council for sanction to borrow £9,500 for the extension and improvement of the electric lighting and power station on Beacon Quay, with the object of providing additional current for the working of the tramways. Mr. Percy T. Pearce (Plymouth), instructed by the town clerk (Mr. F. S. Hex), appeared for the Corporation.

The TOWN CLERK estimated the population at from 34,000 to 35,000, and the annual assessable value £179,573. The balance of outstanding debt was £532,888. Under the local Acts the Council were entitled to deduct loans to the extent of £275,251. The amount to be calculated in respect of two years' assessable value was £257,637, thus leaving the margin of borrowing power in favour of the Corporation £101,509, with £71,909 in the sinking fund. The total of the rates from 1904-5 was 7s. 6d. in the £, and from 1905-6 it was 7s. 5d., showing a decrease of 1d., which represented £690. For the repayment of the loan of £9,500 he asked for the longest period that the Local Government Board would allow the Corporation. The usual period was 25 years.

The INSPECTOR said the period of repayment was likely to be somewhat under 25 years, as only expenditure upon plant was being proposed, and it was not to be expected that plant would last a quarter of a century. Referring to the present inquiry, the inspector said it was more or less the outcome of the inquiry which he held in January in connection with the proposed scheme of constructing a new electrical station at an estimated cost of £42,000. He took it that the matter had been reconsidered, and that the result was the present suggested loan of £9,500 for utilising the present station. He wanted to be quite sure that the Corporation had in view only the one object of making money for the ratepayers, that it was not a question of any sentiment, but one of plain, hard business, and that it was a matter of absolute indifference to the Corporation whether they provided the current or not, unless they were assured that the undertaking would in every sense be a sound business enterprise.

Mr. PEARCE remarked that under the Tramway Act an obligation to supply current was imposed upon the Council.

The INSPECTOR asked if Mr. Pearce referred to the agreement which the Council required the Dolter Tramway Company to enter into with them for the supply of the current.

Mr. PEARCE replied that he was referring to the section of the Act bearing on the point which imposed an obligation on the Council, and which was accepted by them in the belief that it would be beneficial to the ratepayers. It was, perhaps, a mutual obligation which was created by the Act, instead of imposed. Negotiations between the Dolter Company and the Corporation had been going on for a very considerable time. Both parties had been anxious, as far as possible, in consideration of the interests which they severally had to study, to carry out in a reasonable and proper spirit the provisions of the Act, which gave rise to the necessity for the present application. The scheme in principle was approved by Mr. Manville (of the firm of Kincaid, Waller, Manville, and Dawson), who, after working out the same very carefully, would state that, if carried out, it would yield an annual profit of £640. Under these circumstances the Corporation asked for sanction of a scheme which would enable them to discharge their obligations and at the same time give them an opportunity of securing a very profitable daytime consumer, with a result which would be very advantageous to them in every respect. The matter was one of very great urgency. The Corporation were very desirous that everything should be done to enable the Tramways Act to be carried out to its legitimate end, but they could not discharge their obligation satisfactorily unless they could expend the sum asked for to enable them to cope with the demand that would be made under the Act of Parliament.

Mr. MANVILLE stated that he had been appointed by the Corporation to carry out the extension works, assuming that the loan was granted. He produced detailed estimates of the new plant that would be required, and said that when the outside sections of the tramways were eventually completed the profit from the supply of current would probably increase from £640 to £1,100 or £1,200 a year.

The INSPECTOR subsequently referred to the fact of the Dolter Company having offered to annul the agreement and to supply the current themselves, and also to take over the whole of the electricity works. Therefore, as far as the legal position was concerned, the agreement did not now exist.

The TOWN CLERK, however, said this was not the case, and proceeded to explain how the Dolter Company's proposals were received by the Council.

The INSPECTOR said the question was whether it was possible that the present station could be so altered as to supply all the

Digitized by Google

current that would be required for the tramways when constructed. The first section was 4¼ miles, and then another 4¼ miles could be laid down.

The TOWN CLERK said the Corporation could reserve their consent to the second 4¼ miles. The Dolter Company had power to construct 8½ miles, and the Corporation had undertaken to supply current for the whole, with certain reservations as to routes and when they should be commenced.

The INSPECTOR said the Corporation could not unreasonably withhold their consent. There were 8½ miles of tramways to be constructed—4¼ on the consent already given, and 4¼ on consent to be given when they had seen the working of the first section. The first lines of tramways refers to 4¼ miles, but Mr. Manville was making provision for the 8½ miles.

Mr. MANVILLE: That is so.

The INSPECTOR: What position would the Corporation be in if they failed to supply the current.

Mr. MANVILLE: There would be a penalty.

The TOWN CLERK, reverting to proposals received from the Dolter Company, explained that the company offered to provide their own electricity station on certain conditions, one of which was that they should be allowed to run the trams along Torbay-road, and should not be required to have their car-sheds on the Corporation site in Upton Valley.

The INSPECTOR asked if the Corporation had considered the point from its financial position, so that they could say that what they were now doing was for the best. There could be no doubt that the agreement to supply the current to the tramway company was made by the Corporation without any regard to their financial position. If they had regarded it from the proper financial point of view, they would have found that the agreement, which they desired to have embodied in the Act, was not such a very favourable undertaking for them after all, and that the benefits were extremely doubtful.

The TOWN CLERK said with the information then before the Council they were under the serious impression that the price they were going to receive for the current would be a very good paying one.

The INSPECTOR observed that it was no good making a general statement on that score; these were technical matters. It was enough that what was proposed would not have the profitably satisfactory results that the Council anticipated. What became of the other proposals of the Dolter Company, as to taking over the whole of the electricity undertaking and working it on a profit-sharing basis? Were these proposals ignored?

The TOWN CLERK replied that they were not. The Council could not come to a conclusion in the first point until they had Mr. Mitchell's figures before them, and those of the expert (Mr. Manville), whom they had consulted, to see whether, as had now been shown, the scheme would show a profit.

The INSPECTOR: The question is whether the other proposals would not have shown more profit.

The TOWN CLERK said the question of profit-sharing was not entered into. All three proposals were considered, but only one was dealt with and adopted.

The INSPECTOR said before considering Nos. 2 and 3, the Corporation decided to have a report on No. 1, and when they had that they considered it sufficiently satisfactory, without considering Nos. 2 and 3. However, in the absence of any seriously-considered proposition, he did not see how this could be taken farther.

Mr. PEARCE contended that, because the Corporation agreed to the first proposal, it could not be said that they did not do their duty in regard to the other two proposals.

In reply to a question, Mr. MANVILLE said the plant now proposed to be put in the electricity station would carry them on for three years.

The INSPECTOR: What will be the position then?

Mr. MANVILLE: I don't know.

After further evidence and speeches on both side, the INSPECTOR remarked that it seemed clear that the Corporation had made for themselves serious difficulties by entering into an agreement without really considering the financial position they were in to carry it out. That agreement, which bound them to supply current, was made when the Act was passed, because they thought they were getting a very good thing. Many of the difficulties that had arisen appeared to be due to the Corporation entering into an agreement to carry out works for which they had no power and no sanction to raise money. There was an insufficient appreciation on the part of the Corporation of their financial position; they were not in a position to meet the agreement, and hence the difficulties that had arisen during the last 12 months.

The TOWN CLERK asked that the Local Government Board would convey their decision as quickly as possible, having regard to the urgency of the case.

The INSPECTOR said he would do the best he could, but he had several other applications which were represented as of equal urgency. There could, however, be no harm in asking for tenders to save time.

[We are indebted to the *Western Morning News* for the report of the inquiry from which the above is abstracted.—ED. *E. E.*]

PHYSICAL SOCIETY.

At a meeting of the society on Oct. 27, Prof. J. H. Poynting, F.R.S., president, in the chair,

A paper on "*The Theory of Phase Meters*," was read by Dr. W. E. SUMPNER. Phase meters are instruments of the dynamometer type for indicating the phase relations of the currents and potentials in alternating-current circuits. With few exceptions, they are made for use on multiphase circuits. Such instruments consist essentially of two sets of coils, of which one set is fixed, and the other forms a single moving system which is not provided with any form of control. The currents in one set of coils are determined by the voltages of the main circuits, while those in the other set are produced by the circuit currents. With rare exceptions the magnetic circuits of phase-meters are air circuits, containing no iron, so that the magnetic fields associated with them are weak, and the instruments in consequence are of somewhat delicate construction. There, however, appears to be no reason why the use of iron should be avoided in these instruments, and the author shows in the paper that the theory of the instruments is the same whether they contain iron or not, and however the coils may be arranged; that they can be calibrated by direct-current methods, although for use on alternating-current circuits; and that a new type of instrument, containing iron, conforms to the theory given. In all the cases considered, it is assumed (1) that the induction density at any point to the current, A, in a fixed coil is represented by A F, where A is the instantaneous value of the current, A, and F is a quantity dependent merely on the coil and the position of the point considered; and (2) that the principle of superposition holds—viz., $B = A_1 F_1 + A_2 F_2 + A_3 F_3$, where A_1, A_2, A_3 are the currents in the three fixed coils, and the quantities F are functions of the position of the point corresponding to these fixed coils. The author shows that these assumptions hold good even when the paths of the lines of force lies partly through (suitably laminated) iron, and it is necessary to consider the effect of varying permeability and hysteresis. The main results of the investigation are: (1) Phase-meters for multiphase circuits are all equally accurate on balanced loads, provided they have been correctly calibrated and possess no faults due to purely mechanical causes. Their accuracy is not affected by variations in wave form or in current frequency. The calibration of the scale is affected by the number of coils used in the instrument, by the ratios of the ampere-turns used with these coils, by the distribution of the windings, and by the magnetic nature and properties of the magnetic circuits, especially if these contain iron; but the accuracy of the indications is not dependent upon any of these considerations, if the working of the instrument is satisfactory from a mechanical point of view. (2) Phase-meters can be simply and accurately calibrated for balanced loads by means of a direct-current method of test. (3) The error of phase-meters on unbalanced circuits is generally serious for loads which are badly out of balance. The error, like that of a wattmeter, increases rapidly as the power factor of the load diminishes. It can only be reduced at the expense of complication in the instrument, by increasing the number of coils used in the fixed and moving systems, and by arranging the coils and magnetic circuits to be symmetrical in regard to one another. If the true power factor of the load is $\cos\phi$, the reading of the instrument is

$$\cos\phi + \theta \sin\phi,$$

where θ is the phase error due to the unbalanced load, and is the product of two factors, one of which is the maximum value of θ determined by the amount the load is out of balance, and the other may have any value between $+1$ and -1, and determines whether the instrument reads high or low.

The Secretary read a letter from Mr. A. RUSSELL referring to one of the fundamental assumptions made by Dr. Sumpner. The magnetic force, B, at any point on the conductor of the moving coil had been represented by $A_1 F_1 + A_2 F_2 + A_3 F_3$, where F_1, F_2, and F_3 were considered constant. The instantaneous value of the magnetic force at any point was the resultant of the three magnetic forces, $k_1 A_1$, $k_2 A_2$, and $k_3 A_3$, acting in fixed directions at that point. At any instant, therefore,

$$B = k_1 A_1 \cos\phi_1 + k_2 A_2 \cos\phi_2 + k_3 A_3 \cos\phi_3,$$

where ϕ_1, ϕ_2, and ϕ_3 are the angles between B and $k_1 A_1$, $k_2 A_2$, and $k_3 A_3$. As A_1, A_2, and A_3 are not in phase with one another, the direction of the resultant magnetic force is continually altering, and thus ϕ_1, ϕ_2, and ϕ_3 are functions of the time. Hence also the author's factors, F_1, F_2, and F_3, are not constants but functions of the time, and thus the conclusions arrived at in the paper must be modified. Dr. Sumpner's method of calibrating by means of direct currents was novel and valuable, but little confidence could be placed in the readings of phase-meters when the applied waves of potential difference did not follow the harmonic law.

Mr. A. CAMPBELL, referring to the stepped nature of one of the calibration curves obtained by the author, asked if the use of a smooth-core instead of a channelled one would result in a smoother curve.

Mr. K. EDGECUMBE expressed his interest in the paper, and said it was valuable because phase-meters were coming into general use and the literature on the subject was small. Dr. Sumpner had stated in his paper that previous theories had neglected the question of the currents being unbalanced, but he pointed out that Punga in 1902 had described power factor indicators and showed how they could be used with unbalanced loads. It was important to define exactly what is meant by average power factor. The author had given a mathematical definition, but a simpler definition would be that the average power factor is that quantity which multiplied by the phase voltage and the sum of the three currents gives the total power supplied to the line. A disadvantage of power-factor indicators was the difficulty of testing them.

Digitized by Google

Mr. W. DUDDELL asked if the author had assumed that the three voltages were in symmetrical phase relation, and pointed out that in practice differences of as much as 10deg. might occur.

Dr. SUMPNER, in reply, said that in the proof of the paper B was not the maximum flux but the effective part of it, that at right angles to the direction of motion of the conductor. He was aware that it was possible to obtain smoother curves, and had partially done it by a suitable distribution of winding giving a gradually varying flux. In reply to Mr. Duddell, he said he had assumed equal voltages and equal phase relations.

PERSONAL.

Mr. Theodore Rich, lately with Bruce Peebles and Co., and also well known as an officer in the Electrical Engineer Volunteers, has taken up a position in the Soudan Public Works Department. Mr. Rich carries the best wishes of many friends both in London and the provinces.

Mr. W. J. Bache, late city electrical engineer at Gloucester, and now electrical engineer for the borough of Cheltenham, was last week presented with a self-adjusting reading chair, handsomely upholstered and with suitably inscribed plate, by the combined staffs at the works and the guildhall. The presentation was made by Alderman James Fielding (chairman of the Electricity Supply Committee) in the presence of the town clerk (Mr. G. Sheffield Blakeway), the city surveyor (Mr. R. Read), and a large number of the members of the staff and others.

The governing body of the Battersea Polytechnic have appointed Mr. E. G. Tottle, M.I.M.E., to the post of superintendent of the drawing office and workshops in their department of mechanical engineering. Mr. Tottle has had considerable experience as mechanical and electrical engineer both in workshops and drawing offices, and has been for some years superintendent with an important firm of engineers and printing-machine makers. He is at present on the teaching staff of the Chiswick Polytechnic and the Welcome Institute, Deptford.

Mr. Francis H. Davies is leaving the Westinghouse Co. to take up an appointment in the electricity department of the St. Marylebone Borough Council.

We noticed last week the appointment of Mr. R. Hugh Seabrook, of Barking, as electrical engineer to the West Ham Corporation, and we understand that he will take up his duties at the end of this month. Mr. Seabrook is an associate member of both the Institution of Electrical Engineers and the Institute of Mechanical Engineers. He served his time at the works of Messrs. Crompton and Co., Chelmsford, and was by that firm employed in the starting up of the electric power station erected by the firm for the Great Yarmouth Corporation. On the completion of the contract he was offered and accepted the position of assistant engineer to the Corporation. In 1898 he was appointed from some 150 applicants to the post of assistant engineer to the Hampstead Borough Council electricity undertaking. He remained at that place until January, 1901, when he was selected from about 100 applicants to fill his present position at Barking. There he rendered an unprofitable concern into an highly profitable one, reducing the works cost from nearly 3·5d. to 1·5d. per unit.

At the annual meeting of the Provident Society of the London United Tramways Co. on Tuesday, Sir Clifton Robinson, managing director and engineer, was presented with an address in recognition of the knighthood recently conferred on him, and at the same time Lady Robinson received a handsome writing-table equipment.

Mr. J. Archibald Kyle, A.I.E.E., wishes it to be known that he is shortly leaving Aron Electricity Meter Limited, where he has held the position of assistant engineer and technical representative for the last three years.

Mr. J. Allward, senior shift engineer, has been appointed station superintendent at Islington on probation for six months at a salary of £180 per annum, and the temporary appointment of Mr. T. Margery to superintend the mains work has been made permanent at a salary of £200 per annum.

Mr. Albert Moorhouse, formerly secretary of the Blackpool Engineering Works, and who two years ago was appointed engineer at the Burnley workhouse, has been appointed engineer at Willesden infirmary, at a salary of £200 per annum.

HACKNEY ELECTRICITY ACCOUNTS.

The accounts of the Hackney electricity department for the year ended March 31, 1905, show a total expenditure on capital account to that date of £273,897. Abstracts of the revenue account, balance-sheet, etc., are appended.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.
To generation of electricity	5,529	6	2
Distribution of electricity	573	8	3
Attending and repairs to public lamps	1,132	7	8
Rents, rates, and taxes	1,256	6	10
Management expenses, salaries, insurance, etc.	1,977	19	0
	10,469	7	11
Amount carried to net revenue account	20,224	9	5
	£30,693	17	4

Cr. Income.	£	s.	d.
By sale of current per meter, less discounts	21,171	0	1
Public lighting	5,473	17	10
Energy supplied to refuse destructor	3,460	5	3

LEGAL INTELLIGENCE.

WORKMAN'S COMPENSATION.

In the Appeal Court last week, before the Master of the Rolls, Lord Justice Romer, and Lord Justice Mathew, the hearing was continued of the appeal in the case of Rogers *v.* the Cardiff Corporation. Rogers was the driver of a trolley used for the repair of the electric tramway. The horses becoming restive he was thrown off and sustained severe injuries. The county court judge made an award in favour of the man under the Workmen's Compensation Act. The Corporation appealed on the ground that the man was not engaged at the time of the accident "in or about engineering works."

The MASTER OF THE ROLLS, in his judgment, held that the engineering works were coextensive with the tramways.

Lord Justice ROMER said it was impossible to sever the going of a man from one place to another to make repairs, bringing him under the Act at one point and leaving him out of it at another.

Lord Justice MATHEW said a zone could not be drawn around a particular point where repairs happened to be executed.

The appeal was dismissed with costs.

TRAMWAY ADVERTISING CONTRACT.

An action was heard in the Lord Chief Baron's Court, Dublin, last week in which Griffiths and Millington, a firm of advertising contractors, sought to recover damages against the Dublin Tramways Co. for breach of contract. The plaintiffs entered into a contract with the defendant company in June, 1900, to rent a certain number of the ends of the tramcars, to which were to be fixed advertising plates, and the plaintiffs claimed that they had the option to renew the contract. Certain alterations were made in the terms and conditions, and in the number of ends that were rented. In June, 1904, the tramway company handed over their advertising business to a contractor named Courtenay, and they referred the plaintiffs to him for future dealing. The plaintiffs averred that this was a breach of contract, and the defendant company replied that there was no right of renewal, and that, therefore, there was no breach of contract. The case turned mainly on the legal point as to whether the plaintiffs exercised their option to renew within a reasonable time before or after the determination of the first specified period of three years.

The Lord Chief Baron after hearing the arguments felt bound to enter judgment for the defendant company, with costs. The judge allowed the plaintiffs 14 days in which to consider whether they will carry the case to the Divisional Court.

CORPORATION'S LIABILITY.

At the Salford Court of Record last week an action was brought before his Honour Judge Shee, K.C., and a jury, by Dr. Mitchell against the Bury Corporation for £32. 16s. damages for injuries sustained in a collision between his brougham and defendants' tramway. The case had additional importance inasmuch as it also decided the question of liability between the Corporation and the representatives or relatives of the driver of the brougham—Chadwick—who was fatally injured. Negligence was alleged on the part of the tramcar driver, and the defence was that the accident was due to the negligence of the driver of the brougham.

Mr. WM. CLOUGH, tramways manager, said a more competent man than the driver of the car in question was never given charge of a car. He agreed that it was impossible for a car travelling at five miles an hour to be pulled up in a yard or so, and suggested that when the driver stated at the inquest he did so he was labouring under a wrong impression and was upset by the accident. If a car was pulled up in its own length it was good work. It was impossible to utilise the magnetic and hand brakes at the same time, and the driver did the right thing in further applying the latter brake.

For the defence it was submitted that had Chadwick, the driver of the brougham, not crossed to the wrong side of the road the accident could not have happened.

The jury found for the plaintiff, and judgment was given accordingly for £30. An application for a stay of execution was granted.

UNDERGROUND WIRES.

Before the deputy stipendiary (Mr. Milner Jones) at Cardiff on Saturday last an arbitration was held with reference to an application by the Postmaster-General to lay telegraph wires under a portion of North-road.

For the postal authorities it was explained that they desired to erect a new trunk overhead wire for telephone purposes between Cardiff and Pontypridd, and to place several of the existing telegraph wires underground. It was explained that the efficiency of trunk telephone wires was impaired by the interposition of short sections in underground cable, and it was, therefore, desirable that telephone wires should be carried above ground.

Major O'MARA, C.M.G., late of the Royal Engineers, assistant engineer-in-chief for the Post Office, who has charge of the whole of the telephonic arrangements outside London, gave evidence in support of the application. He said that in America they could speak 12,000 miles over the telephone on account of the overhead trunk wire system, while in England they could only speak about 700 miles owing to the trunk wires in some towns being underground.

On behalf of the Cardiff City Council it was submitted that the Corporation were desirous of giving every facility to the Post Office, but they thought that the time had come when the whole of the telegraph wires in the city should be laid underground, and they, therefore, desired the court to impose that condition. It was also submitted that the contention of the Post Office as to impairing the efficiency by placing the wires underground was exaggerated, and that the facilities which had already been granted to London and Birmingham and other large towns ought to be conceded to Cardiff. It was further pointed out that the objection could not be a very serious one, as the National Telephone Company were at present pressing the City Council to allow them to place their wires underground.

Mr. W. Harpur, city engineer, gave evidence on behalf of the Corporation.

The Deputy-Stipendiary reserved his decision.

TRAMWAY INJURY.

The Leicester Corporation were sued in the county court on Saturday last by H. J. Dawes for the recovery of £100 damages for personal injuries sustained by reason of the alleged negligence of an electric car driver.

Plaintiff stated that he was in the act of crossing the road and waited till a car going up the road had passed, and then attempted to cross the rails behind it when he was knocked down by one coming in the opposite direction. He was rendered unconscious, and was taken to the infirmary, where it was found that his right arm was broken at the elbow and his right eye injured.

For the defence it was stated that the driver used all necessary precautions to avoid an accident, and the car was only travelling at average speed.

The jury found for the plaintiff, awarding £47. 10s. damages.

Leave to appeal on the ground that the verdict was against the weight of evidence was refused.

His Honour entered judgment for the amount, but granted a stay of execution.

ELECTRICAL FRAUDS.

At the Guildhall, before Alderman Sir John Bell, William Leslie, Alice Frances Cheesman, George Webber, and Richard Thomas Rosenberg were again charged on remand with conspiring together to defraud various firms dealing in electrical apparatus, and were committed for trial.

DUFFY v. DUBLIN UNITED TRAMWAYS CO.

An application was made in the Dublin High Court on Tuesday last on behalf of the defendants in the case of Duffy *v.* Dublin United Tramways Co. to have the action remitted for trial to the recorder. The action is for the recovery of damages for injuries sustained by the plaintiff in being run over by one of the defendant company's tramcars. The Court decided to remit the action.

COMPANIES' MEETINGS AND REPORTS

BUENOS AYRES GRAND NATIONAL TRAMWAYS.

The report of this Company for the year ended March 31 last, to be submitted at a meeting to-day, states that the gross receipts of the Grand National lines have amounted to £176,897, as compared with £172,654 for the previous year. The working expenses amounted to £130,997, as compared with £128 140. The Company's share of the profits derived from the working of the joint lines under the agreement has amounted to £40,386, as compared with £40,117. After payment of the London administration expenses and interest on the debentures, there remains a balance of £10,652, from which £3,789 has been transferred to debenture reserve funds and £3,726 to income bondholders' interest account, leaving £3 187 to be carried to a contingency fund. The amount at the credit of income bonds interest account is £5,320. It is proposed to pay interest at the rate of 5 per cent. per annum for the year on these bonds (this will absorb £3,726), also to pay 2 per cent. on these bonds out of the amount (£1,563) transferred from suspense account (this will absorb £1,490), leaving £104 to be carried forward. Satisfactory progress has been made with the work of converting for electric operation the joint system consisting of the lines of this Company and those of the Buenos Ayres New Tramways Company. Twenty-four miles have been opened to public service by electricity. In view of the improvement in the Company's position expected from the electrical operation of its lines, the directors have felt the urgent necessity of dealing with the capital and revenue accounts so as to enable the shareholders to reap the benefit of the improvement without undue delay. They have, with that object, been in constant consultation with many of the largest holders of the various securities and stocks of the Company. Acting upon the recommendation of their legal advisers, they have decided to proceed by a Bill in Parliament for the reorganisation of the Company's capital and revenue accounts upon a basis the details of which will in due course be submitted to all the various security holders for their approval, and it is proposed to deposit a Bill with this object in the course of next month.

CAPE ELECTRIC TRAMWAYS.

An extraordinary general meeting of this Company was held last week for the purpose of passing, or otherwise, a resolution giving the directors power to rise £200,000 by the issue of fresh debentures. Sir Charles Euan Smith presided.

The CHAIRMAN, in moving the resolution, explained that the

Digitized by Google

meeting was necessary because the existing borrowing powers of the Board had been exercised to the full. The present debenture obligation of the Company was an issue of £286,800 in bonds of £100 each, bearing 6 per cent. interest per annum, and £140,000 in bonds of £100 each, bearing 5 per cent., on the general security of the assets of the Company. The debentures which it was now proposed to issue would be termed "B" debentures, bearing 5 per cent. interest. The reason for the issue of the debentures was the necessity of providing further capital for expenditure already incurred, and still to be incurred, over and above the existing cash resources of the Company, for the following objects: For some years past the Company's representatives in Cape Town had been negotiating with the municipal authorities to extend the system through the important thoroughfare of Buitengracht-street. A satisfactory agreement was some months ago finally concluded with the municipality, and the work of this important concession was now being actively proceeded with. For the renewal of the rails and the relaying of the track over nearly the whole of the system. The Cape electric tramways had now been running in Cape Town since 1896, and the nine years' heavy and continuous traffic on the badly constructed roadways of Cape Town had rendered this measure absolutely necessary, notwithstanding the sums yearly expended on the ordinary maintenance and upkeep of the lines and of the rolling stock. Other extensions and improvements had also been found requisite to bring the whole system into a thoroughly efficient condition. The whole of the reserve fund (£154 000) had been invested up to date in the extensions of the system that had been sanctioned from time to time, and to this extent the necessity of issuing fresh capital had been avoided. For the construction of extensions and renewals the expenditure to date had crept up to £150,000. Against this the Company held £40,000 Consols and other assets, estimated together roughly at £80,000, leaving the sum of £70,000. The construction work yet to be completed was estimated to cost £50,000, leaving the sum of about £120,000 to be provided for. The directors hoped that the issue of £100,000 of these debentures would be sufficient to meet their financial requirements.

Mr. L. BREITMEYER seconded the resolution.

Replying to a question, Mr. W. B. ROMMEL, managing director, stated that the total expenditure for track renewal was £95,000.

After a long discussion, during which the management came in for criticism, the resolution was carried with one dissentient.

WESTMINSTER ELECTRIC SUPPLY.

An extraordinary general meeting of the preference shareholders of the Westminster Electric Supply Corporation, Limited, was held on Tuesday last at the registered offices of the company, Lord Suffield presiding.

Mr. HAYES FISHER, M.P., moved a resolution to obtain power to enable the company to raise such additional capital as may be required during the next 26 years. He said that the present expenditure of capital was roughly a million pounds. They contemplate the expenditure of a further £1,000,000. Of this sum one-fourth, or a quarter of a million pounds, will be spent during the next few years. This it is proposed to issue at once in preference shares. Mr. Fisher sketched the growth of the concern, and explained that the borrowing powers which they now sought was to enable the Company to meet the growing demand for current, which was utilised for many varying purposes. Other sources of demand are also anticipated, and to be able to cope with these two more transformer stations of about the same capacity as Duke-street will be eventually required, part of which must be put in hand almost immediately. Provision has also to be made for the mains department within the next few years, in connection with which it is suggested that stores should be erected at Eccleston-place. There is still a considerable balance on account of Duke-street to be paid. The other two stations will probably cost very much less than Duke-street, but taking it all round it can hardly be said that less than £150,000 will be required for land and buildings by the end of our term. Plant and machinery to equip these three transformer stations would cost approximately £200,000. The Board, therefore, recommend that the authorised amount of share capital be increased to £2 000 000, divided into £1,000,000 cumulative preference share capital and £1,000,000 ordinary share capital. The above £1,0.0,000 preference capital to carry a preferential right over the ordinary shares of the Company in the distribution of the assets in the case of the winding-up of the Company, and a *pro rata* share of any surplus after the repayment of ordinary capital at par. That the preference shares of the Company for the time being issued should carry a cumulative preference dividend of £4. 10s. per cent. per annum, instead of £5 per cent. per annum, and that the holders of the £140,755 of 5 per cent. preference shares be allotted an amount of £15,640 in 3,128 preference shares of £5 each to be paid for by a bonus free of income tax out of the reserve fund of the Corporation.

Lord KINNAIRD seconded the motion, and it was carried unanimously.

BRAZILIAN STREET RAILWAY.

The directors' report for the sixth year's working of this Company, to be presented at the meeting on the 7th inst., states that the gross receipts were £22,802, as against £24,107 in the previous year. The total expenditure was £17,445 against £18 203, leaving a balance of £5,357, to which is added £1,079 gain in exchange and £410 brought forward from last year, making together £6,846 After deducting £3,297 for debenture stock interest, and placing £410 to the credit of renewals account, there remains a surplus of £4,149, out of which the directors recommend a dividend of 5 per cent., less income tax, being paid on the preference shares for the year ended July 31 last, amounting to £1,475, and a dividend of 2½ per cent. on the ordinary shares, free of income tax, amounting to £2,172, carrying forward £500.

ROSARIO ELECTRIC.

The third annual meeting of this Company was held in London on Tuesday last.

Mr. W. F. LEESE presided and moved the adoption of the report, a copy of which appeared in our last week's issue. He stated that during the 12 months the number of their consumers had advanced from 837 to 1,325, and at the end of August they had put on another 112 new consumers, making a total of 1,437. One of the most valuable of the branches of trade that an electric company could do was that of motors. On June 30, 1904, they had 38 motors, on June 3, 1905, they had 113 motors of 545 h.p., so that that part of the business was increasing satisfactorily. Their business had so steadily increased that they had no proper reserve of batteries, and the £40,000 additional capital authorised last year had been overspent.

The report was adopted.

EDISON AND SWAN UNITED ELECTRIC LIGHT.

An extraordinary meeting of this Company was held on Monday last in London.

Mr. H. WOLFENDEN, who presided, moved the confirmation of a resolution passed at a former meeting reducing the capital from £941,090 to £888,071 by cancelling paid-up capital which was lost or was unrepresented by available assets to the extent of £2. 5s. per share on the 23,564 B shares, and by reducing the nominal amount of these shares to 5s. each.

The motion was carried, and a further resolution was approved to the effect that irrespective of any remuneration to which the directors might be entitled they should receive for their services during the year ended June 30 last the additional sum of 750 guineas, such amount to be divided among them as they might agree.

WESTERN TELEGRAPH.

The ordinary half-yearly meeting of this Company was held on Wednesday.

Sir JOHN WOLFE BARRY, in moving the adoption of the report and accounts (copy of which we published in our previous issue), said it afforded him great pleasure to call the shareholders' attention to the continuance of the prosperous condition of affairs in South America. Their message receipts for the period under review amounted in round figures to £253,000, and for the corresponding period in 1904 to £216,000, being an increase of between £37,000 and £38,000. During the current half-year this improvement was maintained, and although the prospect was encouraging, they must be prepared for times of depression and slackness of trade, which appeared sooner or later to every community. Their revenue had not been obtained without some increased expenditure, but a large proportion of the extra working cost was accounted for by the enhanced value of Brazilian currency, which, while augmenting the value of their remittances, caused a corresponding increase in the necessary expenditure in Brazil.

A dividend of 3s. per share, making, with the interim dividend already paid, a total dividend of 6 per cent. for the year, and also a bonus of 2s. per share was declared.

The report was unanimously adopted.

MONTE VIDEO TELEPHONE.

Mr. FRANK W. JONES presided at the annual meeting of this Company, and, in moving the adoption of the report, said that since the rearrangement of the Company in 1898 their position had continuously and steadily improved. The net profits increased from £6,826 in the year named to £15,473 in 1905, after providing for all working expenses in Monte Video and London, and although there had been a civil war it had interfered but little with their business, and they had now practically no indebtedness, while holding securities of the value of over £12,000. Altogether the prospects of the Company were excellent, and the period had arrived in their history when increased dividends might with certainty be looked forward to.

The report was unanimously approved.

EASTERN TELEGRAPH.

The half-yearly ordinary general meeting was held on Wednesday in London, under the presidency of Sir John Wolfe Barry, K.C.B.

The CHAIRMAN, in moving the adoption of the report (a copy of which appeared in our issue last week), said that a portion of the increase in revenue was attributable to the war in the Far East. Since the conclusion of peace a falling off had been noticeable in the China and Japan traffic.

The MARQUIS OF TWEEDDALE seconded the motion, which was carried unanimously.

ELECTROLYTIC ALKALI.

The report of the directors of this Company for the year ended Aug. 31 states that the net profit is £4,745. To this is to be added the amount brought forward from last year—namely, £1,374—making a total of £6,120. The directors propose that this amount be applied in paying, on account of the arrears of dividend upon the cumulative

Digitized by Google

preference shares, the amount of one year's dividend, at the rate of 7 per cent. per annum, on all the preference shares issued prior to April, 1902, and a dividend at the same rate upon all the preference shares issued since that date, calculated, as regards all instalments paid on such shares since Aug. 31, 1902, from the several dates of payment of such instalments up to Aug. 31, 1903. This will absorb a sum of £5,601 and leave £519 to be carried forward to the next account. The process, state the directors, continues to work satisfactorily, and there is a good demand for the Company's products. Towards the close of the year the erection of additional manufacturing plant was continued, and the Company is now in a better position for dealing with an increased volume of business.

BRITISH THOMSON-HOUSTON.

The report of this Company for the year ended March 31 last, to be submitted at the meeting on the 8th inst., shows a trading profit for the year of £29,026, to which must be added £2,822 brought forward together £31,848. After allowing for depreciation, writing £1,944 off goodwill, and £8,000 off suspense account, there remains to be carried forward £1,696. At Rugby the buildings and machinery of the Company have been maintained in first-class condition during the year. During the period under review the Company secured contracts for the electrical equipment of all the remaining trains on railways controlled by the Underground Electric Railways Co. of London, including its various tube railways. The system is the multiple-unit system, similar to that heretofore furnished to the District Railway, the Central London Railway, the Great Northern and City Railway, and the North-Eastern Railway. The electrical equipments furnished are operating satisfactorily. The manufacture of Curtis turbines has progressed satisfactorily, and a number have been built in the Rugby works, all of which are giving excellent results. The directors believe that the Company has good value in the enterprises in which it has investments. Since the closing of the books on March 31 the Company has disposed of a large amount of these securities and reduced proportionately its liabilities. As shown by the balance-sheet last year the excess cost of manufacturing incident to the establishment of the manufacturing business of the Company amounted to £63,326, of which amount £20,000 was at that time written off. There has been added to this account during the year the sum of £3,934, and there has been written off a further sum of £8,000, leaving the balance of the account £39,261, from which further amounts will be written off from time to time until finally disposed of.

NEW COMPANIES REGISTERED.

A. W. Penrose and Co., Limited.—Capital, £40,000. Object: to acquire and carry on the business of A. W. Penrose and Co. at 109, Farringdon-road, E.C., as manufacturers of and dealers in all machinery, apparatus, material, and appliances used in connection with photography or other graphic arts, manufacturers of electric cranes and hoists, makers of printing-machine motors and gears, electrical and general engineers, etc. Registered office: 109, Farringdon-road, E.C.

West African Rubber Plantations, Limited.—Capital, £25,000. Object: to acquire any concessions, grants, rights, powers, privileges, lands, hereditaments, or property in Africa or elsewhere; to develop and turn to account the same; and to carry on the business of African merchants, traders, planters, cultivators, manufacturers, importers and exporters of and dealers in rubber, guttapercha, gums, and other produce, plantation owners, etc.

Light Railways Company of Sicily, Limited. — Capital, £12,000. Object: to acquire any railways or tramways, electric lighting works, plant and machinery in Sicily or other part of Italy or elsewhere, and to carry on the business of railway and tramway proprietors, etc.

Liens Registered.

Improved Electric Supplies, Limited, Westminster.—Lien registered Oct. 18 for £2,500 6 per cent. second debentures. Holder: W. Chamberlain, of Cobham. Charged on the undertaking and all the property, present and future, including the uncalled capital.

Engineering Instruments, Limited, Islington, N. — Lien registered Oct. 20 for £2,000 5 per cent. debentures, part of £3,000 authorised. No trustees. Charged on the undertaking and all the property, present and future, including the uncalled capital for the time being.

Newcastle and District Electric Lighting Co., Limited. Discharge registered Oct. 18 of debentures dated Sept. 9, 1903, for £11,085.

Chepstow Electric Lighting and Power Co., Limited.—Lien registered Oct. 20 for £1,000 5 per cent. debentures, part of £3,000 authorised. Holders: India Rubber, Gutta Percha, and Telegraph Works Co., Limited. Charged on the undertaking and all the property and assets, present and future, including the uncalled capital.

CONTRACTS FOR ELECTRICAL SUPPLIES.

ermondsey.—Tenders for new plant will shortly be advertised for.

Vienna.—The Government Railways require tenders for telegraph tape. Tenders by Nov. 10.

Genoa.—The Artillery Workshops require tenders for copper wire and bars. Tenders by Nov. 9.

Wimbledon.—We understand that tenders will be called shortly for electric pumps for the sewage works.

Porto.—The Municipality require tenders for a concession for working the electric tramways in the town. Tenders by Nov. 8. Preliminary deposit, 100 contos de reis.

Algiers.—The Inspector-General of the Post Office, Rue Dumont d'Urville, requires during the next two years 48,550 impregnated telegraph poles. Tenders by Nov. 10.

Belfast.—Electric light and fittings are required in the Scottish Temperance Assurance Buildings, Belfast. Tenders to Mr. Henry Beaver, architect, 22, Donegall-place, Belfast, by Nov. 3.

Shoreditch.—The Borough Council invite tenders for the extension of plant at their Whiston street generating station. Tenders to the Town Clerk by Nov. 7. See advertisement in last issue.

Edinburgh.—The Parish Council invite tenders for an installation of intercommunication telephone system throughout the offices, Castle-terrace, Edinburgh. Tenders to the Clerk by 10 a.m. on Nov. 7.

Sao Luiz.—The Municipality require tenders for electric lighting of the town. Tenders by Dec. 16. Particulars may be obtained from the Municipal Secretary of Sao Luiz in the State of Maranhao, Brazil.

Macroom (Ireland).—The Urban District Council invite tenders for lighting the streets of the town by electric light or acetylene gas. Tenders and specifications to Mr. T. Murphy, clerk, by 8 p.m. on Nov. 10.

Brisbane.—The Postmaster-General invites tenders for 150 branching system table telephones. Tenders by Dec. 1. Particulars may be obtained from the Postmasters-General at Sydney, Melbourne, Brisbane, and Adelaide.

Altrincham.—The Altrincham and Bowdon Administrative Sub-Committee for Education invite tenders for the electric wiring and fittings required for the Stamford Park new Council schools. Tenders to the Clerk by noon on Nov. 3.

Manchester.—The Tramways Committee invite tenders for the supply of (*a*) tramcar trucks, (*b*) electrical equipments for cars. Tenders to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester, by 1 p.m. on Nov. 11.

Harrogate.—The Directors of the Frederick Hotels Co. invite specification and tenders for laying down electrical plant at the Hotel Majestic, Harrogate. Further particulars on application to the Secretary, 8, Bloomsbury-square, London, W.C.

Clacton-on-Sea.—The Urban District Council invite tenders for the supply and erection of (Section A) gas-engines and dynamos; (B) switchboard; (C) underground mains; (D) accumulators; (E) meters; (F) crane; (G) buildings. Tenders to Mr. G. T. Lewis, clerk, by 3 p.m. on Nov. 6.

Barrow-in-Furness.—The Corporation invites tenders for the supply and erection of a 500-kw. combined steam-engine and generator, balancer booster, switchboard, water-tube boiler, mechanical stoker, economiser, travelling crane, cooling tower, pipes, etc. Tenders by 12 noon on Nov. 13. See advertisement.

Cape Town.—The Cape Post and Telegraph Office invite tenders for telegraph and electric light material. Tenders will be received by the Chairman of the Tender Board, Control and Audit Office, Parliament-street, Cape Town, up to noon on Nov. 22. Samples may be inspected and forms of tender, copies of specifications, together with any other information required, may be obtained on application to the Controller of Stores, General Post Office, Cape Town.

Spain.—The *Gaceta de Madrid* of Oct. 10 contains details of a concession for the construction of an electric tramway as an extension of that of the east of Madrid. Tenders must be sent in by Dec. 13 to the Director of Public Works, Madrid, in whose office particulars may be seen. A deposit of 1,899·95 pesetas, or about £60, is required to qualify any tender. Local representation is necessary. The same journal of Oct. 12 contains a notice of a concession granted to the Sociedad Los Tranvias de Zaragoza for the construction of an electric motor tramway in that city. The *Gacetas* may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

Netherlands.—The Board of Trade have been notified by the acting British consul at Amsterdam (Mr. F. A. Chambers) that the Zuid-Hollandsche Electrische Spoorweg-Maatschappij (South Holland Electric Railway Co.) will be prepared to receive tenders for the making of ground works, engineering, and additional works between the Ceinturbaan and "piket 1[illegible]0 by 70" (in connection with the works of Contract No. 14), the laying of rails and switches, and the supply and use of gravel ballast, as well as some works in connection with the railway, in accordance with Contract No. 17. The estimated cost of the work is 936,000fl. (£78,000). On Oct. 25, at 10.30 a.m., an explanation will be given, meeting place Café, "Plaats Lommerrijk," on the Bergweg, near Hillegersberg. Copies of the contract, with drawings, may be obtained from Messrs. Beversen and Van Hoorn Heerengracht, 38, The Hague, at a cost of 12·20fl. (£1. 0s. 4d.). Tenders should be written on stamped paper, and received before 1.15 p.m. on Nov. 2.

RESULTS OF TENDERS.

Islington.—The Council have accepted a tender of Messrs. Phillips and Co. for 5,000 tons of coal at 2s. 6d. at pit's mouth and 9s. 3d. delivered.

Leek.—The Urban District Council have decided to purchase an earth recording ammeter from Crompton and Co. at a cost of £34. 5s., and two maximum and reverse current breakers at a cost of £26.

Southgate.—The following tenders have been received for the work and materials required in the construction of the permanent way

Digitized by Google

(for electric traction), bridge work, road widenings, etc., for Contract No. 14; railway No. 2 (order 1900)—a line of double track (with crossovers, contingent works, etc.) to be laid along Bounds Green-road, in the district of Wood Green, and High-road, in the district of Southgate, in the county of Middlesex, to a length of 1 mile 5 furlongs 1 chain, or thereabouts, for the Light Railways and Tramways Committee of the Middlesex County Council:

T. Adams	£39,818	3	2
G. Bell	40 235	0	0
British Electric Equipment Co.	37 488	5	8
Dick, Kerr, and Co.	38 386	19	2

G. Law	27,370	0	6
Muirhead, Greig, and Matthews	35,066	9	7

Engineer's revised estimates, £33,491. 14s. 7d.

BUSINESS NOTES.

TRACTION.

Perth.—The new electric car service was inaugurated on Tuesday last.

Leigh.—The Town Council have granted permission to the electrical engineer to take on an articled pupil.

Rotherham.—The question of ½d. fares has been again considered by the Tramways Committee, but no decision arrived at.

Mnotothal Valley.—Electric railways are to be constructed in the Swiss Caverns, and a company is being formed in Brussels for the purpose of developing them.

Croydon.—The November municipal elections were fought on the question of the working of the tramways, and in the wards candidates who supported the Corporation working them as against the British Electric Traction Co. were returned.

Brighton.—The Brighton Town Council have adopted the recommendation of the Tramways Committee to discontinue the running of tramcars to the top of Elm-grove during the winter months. A rearrangement of fares was also decided upon.

West Ham.—We understand that Mr. J. H. E. Blain, the tramways manager, is in future to supervise the overhead equipment instead of the electrical engineer. The Corporation have also reduced the price of current for tramway purposes to 1d. per unit.

Trafford Park Estates.—In presenting their report, the directors of this company state that traffic arrangements have been made with the Lancashire and Yorkshire Railway Co. and the London and North-Western Railway Co. which will result in additional income.

Switzerland.—The *Feuille Federale Suisse* publishes a decree granting to the Alioth Electric Co., of Bâle, and Messrs. Vallière and Simon, engineers, of Lausanne, a concession for the construction and working of an electric railway from Sépey to Ormont-Dessus.

Barnsley.—In reference to the Town Council's complaint regarding the condition of a portion of the track, it was announced at the last meeting of the Council that the electric traction company had ordered setts, and that the work of repair would be gone on with as soon as they arrived.

North-Eastern Railway.—A fire broke out at the company's transforming station at Wallsend on Saturday last. The fire is due to the fusing of some temporary cables during the progress of preliminary tests. There was a stoppage of the electric train service for about one hour.

Fareham.—While four men were engaged at work on the overhead wires a large wooden pole by which the trolley wires are suspended broke in the centre. Two of the men were thrown violently to the ground, one sustaining a fracture of the left leg, while the other was injured about the body.

Swindon.—The Council have resolved to purchase three additional tramcars, the type to be settled at the next meeting of the Council, whilst extensions to the car-sheds have been decided upon. The Tramway Committee's recommendation that it was inadvisable to make a junction between certain lines was adopted.

Hammersmith.—The Works Committee of the Borough Council have been informed that the Postmaster-General cannot accept the Council's refusal of consent to the placing of overground telegraph lines along several streets in the borough, but the committee recommend to the Council that their former decision be adhered to.

Bolton.—At last week's meeting of the Town Council, the Chairman of the Tramways Committee stated that the through route between Tonge Moor and Great Lever had not been a great success. They had run 170 miles extra on the through route during the last fortnight, and the receipts had been actually less than under the old conditions.

Bethnal Green.—The General Purposes Committee of the Borough Council recommend that the Council concur in the action of the Borough Councils of Hackney, Lewisham, and Camberwell, and that the London County Council be requested to reintroduce a Bill similar to the (Tramways and Improvements) Bill rejected last session by the House of Lords.

Stourbridge.—It was reported at a meeting of the District Council that the British Electric Traction Co. intended to apply to the Board of Trade for their approval to a transfer of the Kinver light railway undertaking to the Dudley, Stourbridge, and District Electric Traction Co. A sub-committee was appointed to consider any representations to be made on the subject.

Chester.—The Postmen's Federation have been inquiring whether postmen were not entitled to the same privileges as workmen when travelling by workmen's cars, and the Tramways Committee have decided that in future all persons travelling by cars labelled "workmen's cars" shall be entitled to the privileges of the ½d. stages, and that on these cars only tickets for ½d. stages be issued.

Wigan.—At the last meeting of the Electric Light and Tramways Committee it was resolved that notice be served upon the South Lancashire Tramways Co. requiring them, in accordance with the agreement between the company and the Corporation, to transfer their rights, powers, and obligations to the Abram District Council in regard to the tramway situated on the north side of Dover Bridge.

Torquay.—A meeting of the Town Council was held last Monday, when the present position of the Corporation in connection with the tramway undertaking was discussed at some length. We called attention last week to the differences which had arisen between the Corporation and the contractors (the Dolter Co.). The Council have now decided to hold a conference with the company with a view to effecting an arrangement.

Poole.—With regard to the proposed light railway extension to Swanage, the Harbour Commissioners, at a meeting held last week, decided to support the scheme provided adequate means were taken to prevent hindrance to navigation, and they recommend that consent be given to the scheme only on condition that the clear span of the waterway be 670ft., and that the span of the bridge be from shore to shore, with no columns in the water.

Cleckheaton.—A meeting of the Council was held on Monday last, at which a letter was read from the town clerk of Bradford inviting the Council to be represented at a conference on the subject of the proposed linking-up of the Spen Valley and Bradford tramways at Oakenshaw. It was decided to take no action pending the receipt of a reply from the British Electric Traction Co., who work the Spen Valley lines, and who have been written to on the subject.

Heywood.—It was reported at the last Council meeting that an agreement had been come to with Bury Corporation for the starting of tramcars. About the middle of this month the tramway track would have been laid with the exception of the crossings in the Market-place leading to Hopwood and the Hopwood length. Work was well forward, and the machinery had been tested. If the cars earned 10d. per car mile on a 10 minutes' service, the tramways undertaking would be profitable.

Hanley.—The Finance Committee have recommended the purchase of property in the vicinity of Snow-hill for improvements to be made, allowing for the running of trams. The Town Council have approved of the proposal of the Finance Committee that the Potteries Electric Traction Co. be permitted to extend the loop at Howard-place, so as to enable a double line to be laid in the centre of the road. The Council have further agreed to contribute £250 towards the cost of the extensions.

Underground Fares.—The Metropolitan Railway Co. announce an important reduction of fares between the West-end and Paddington and the City, reaching as far as Aldgate. The reduced fares, which came into force on the 1st inst., enable the public to travel from Paddington to the City, either to Moorgate-street, Bishopsgate, or Aldgate, for 2d. third-class and 3d. first-class. The company are retaining the 1d. and 1½d. fares for shorter distances and are continuing the issue of workmen's tickets.

Bonnyrigg.—The members of the Town Council met the ratepayers at the annual meeting which usually takes place before the election. Provost Gilchrist was able to inform the meeting that he had it on the authority of the engineer that the tramways would be running by April next. Negotiations with the tramway syndicate had resulted in a reduction of fares over some of the routes. Several members expressed themselves strongly against the running of Sunday cars, and deprecated the action of the Council in granting their permission.

Digitized by Google

Hastings.—In view of the winter season the tramways company have reduced their service of cars except on the Old Town route, where the service has been accelerated. The claim of Messrs. Breeds and Co. against the Hastings Tramways Co. for £1,604 in respect of certain land and for damages for injury to their property through the erection of a tramway in close proximity to it was submitted to arbitration. The inquiry was conducted in London, and at the close the umpire announced that he would deliver his award in due course.

Traffic Returns.—The receipts of the North Metropolitan Electric Tramways for the past week show a decrease of £561. Returns from the Buenos Ayres and Belgiano Electric Tramways for the week ended Oct. 29 show a decrease of £420. The total receipts of the Buenos Ayres Electric Tramways for the week ended Sept. 30 amounted to £1,223. The gross receipts of the Natal Zululand Railway for September were £5 less than those of the previous month, whilst the Havana Railway receipts for the week ended Oct. 15 increased £1,887.

Batley.—Progress is being made with the electrification of the Bradford-road tramway system, and the Dewsbury-to-Batley section is now complete. The trial trip was held last week and the route between Dewsbury and Batley was traversed in less than 10 minutes. The journey was accomplished without a hitch, and the service opened to the public on Friday last. It is hoped that the section between Birstall and Birkenshaw will be ready for opening shortly, but the portion from Batley to Birstall, it is understood, will not be completed until the end of this month.

Edinburgh.—The tramways company are stated to be willing to agree to the closing of the tramways capital account at the present figure, £1,290,000, upon certain conditions, and to pay by longer instalments the sum of £22,500 earlier than they would have done under the old lease. Under the new proposals the company are granted a reduction of £10,000, with the stipulation that if within the last six years of the lease they pay a dividend of 5 per cent. to their shareholders they will pay interest on an additional £6,000 to the Corporation. The maximum rent is fixed at £95,000.

Woolwich.—At a meeting of the Borough Council held last week a report was presented by the General Purposes Committee in the form of a history of the Plumstead tramways scheme. Public feeling in the borough is strongly in favour of electric tramways, and the Borough Council are willing to supply the London County Council with all the necessary motive power. A deputation waited upon the Improvements Committee of the London County Council last month, and they report that favourable consideration will be given to the suggestions of the Borough Council for an extension of the electric system.

Wednesbury.—A special meeting of the Town Council was held last week, at which it was proposed and carried that, in accordance with the provisions of the Tramways Act, notice be given to the South Staffordshire Tramways Co. requiring them to sell the section of the tramway between Wednesbury and Walsall, other portions having been purchased from time to time as occasion arose, with the result that only this part of the lines within the borough remained to be acquired. The Corporation would then be in a position to pay to the tramway company the sum agreed upon as the purchase price of the undertaking.

Tramways and Light Railways Association.—Some of the members visited the power station of the North Metropolitan Electric Electric Power Supply Company at Brimsdown on Tuesday last and inspected the equipment of that establishment. After having viewed with great interest the boilers, turbines, and the three three-phase generators, capable of generating 10 000 volts at 1 500 revolutions per minute, the members of the association paid a visit to certain of the four sub-stations scattered over the company's district, at which the high-tension current of 10,000 volts is converted into continuous current at 550 volts for line work, and they also travelled over portions of the tramway, which is operated by overhead equipment, and forms an important addition to the means of locomotion in North London.

Exeter.—At a meeting of the City Council, the Mayor, in moving the adoption of the report of the Tramways Committee, said the estimate for the whole of the tramways mentioned in the Act was £95,000. The Council had spent up to the present £67,489. Deducting £7,852 for the purchase of the old horse undertaking that made £59,637. If they constructed the whole of the rest of the tramways upon the estimate that was given, the total cost would be £31,800. Adding that to the sum already spent that would make a total of £91,437, instead of the estimate in the bill of £95,000. They had in the past six months carried two million persons, and taken close on £19,000. That had exceeded expectations and left a good margin for any falling-off in the winter. The report was adopted.

Ipswich.—We understand that the tramway receipts for the past six months have totalled £12,758, against total working expenses of £8,437, leaving a gross profit of £4,318. After paying interest on loan and apportioning money for the repayment of loan, the profit is reduced to £1,540. To this figure must be added £660 voted to the tramways as part of a rate in aid, leaving £2,200 as the total sum available to the committee, which, applied to the reduction of the total deficit of March 31 last (£2,742), brings the total deficit down to £542. The average weekly working expenses for the past six months, compared with the average weekly expenses for the year ending March 31 last, show a decrease of £38 per week. The average receipts per car mile during the past six months stand at 8·86d., against 8·92d. for the same period last year, and the average passengers per car mile similarly compared are 8·29, against 8·92.

Elland.—An important letter was read at the monthly meeting of the District Council on Tuesday bearing upon the question of tramways to Elland. The National Electric Construction Co., who are the promoters, state in their letter that it was proposed to join the Halifax system at West-vale and proceed by way of Long Wall and Victoria-road through Elland to the bottom of Ainleys, thence along the hill-side by a new road between Elland Upper Edge and Elland Lower Edge, across to Fartown, with a third rail and running powers over the Huddersfield tramways into the middle of the town. Running powers are also being sought over the Halifax system from West-vale, so that there might be through traffic between Halifax, Elland, and Huddersfield without change of car. It is also intended to take over the authorised tramways through Rastrick into Brighouse from the Huddersfield Corporation. The Council provisionally approved of the scheme, but reserved the right to discuss it when it came before the Council.

Jarrow.—At a meeting of the Town Council a letter was read from the British Electric Traction Co., asking the consent of the Council to their proposal to allow the Albert-road section of their scheme to drop. The letter stated that the Albert-road railway was of little importance to the scheme, and was only included in the provisional order with a view to possible extensions. That was found to be impracticable, as the crossing of the railway line at the termination of the section was one which neither Parliament or the Board of Trade would sanction. The consent of the Council was all that was required before proceeding with the remainder of the work, as they had already provisionally accepted a tender for the construction of the permanent way. The Tramway Committee recommended that the company be asked to carry out the scheme of the Light Railway Act, and that no further delay be consented to. This was approved by the Council.

Kirkcaldy.—In connection with the Wemyss tramway scheme the District Committee had before them at their meeting on Saturday last the opinion of a King's counsel, who advised that they could not sanction the laying of the tramway on any part of the public roads other than on the metal bed. The committee recommended that the promoters should widen the road where it was desired to utilise the portion of the road at present occupied by the waste or grass margin for the tramways, so as to make the metal bed of the road sufficiently wide to permit of the tramways being laid according to the promoters' plans. A letter was read from Mr. Sellon, engineer for the tramways, stating that material to the value of several thousand pounds had already been purchased, and with a view to the forward state of the promoters' preparations, and in order to save further time, he had submitted the matter to the Board of Trade. The committee agreed to inquire from the Board of Trade whether that body had power to deal with the matter.

Newcastle.—At a meeting of the Tramways Committee held last week the town clerk presented a letter he had received from the Newburn Urban Council, to the effect that they would like to have an interview with the committee respecting the possibility of extending the tramlines to Newburn. A sub-committee was appointed to talk over the question with members of the Newburn Council. The sub-committee of the tramways reported that they had had a long interview with Colonel von Donop, representing the Board of Trade, who had been in Newcastle for the purpose of meeting the committee and going into the question of making the Newcastle tramways down Fisher-hill, where the line belonging to the Newcastle Corporation adjoins that of the Tyneside Tramway Co. The hill has a very steep gradient and an acute curve at the bottom. A number of experiments had been made by the committee to see if the traffic could be conducted safely. Four cars had been fitted with special brakes, and several times made to work the gradient and the curve. On every occasion the cars had got away in spite of the brakes, and on the return journey each failed to take the gradient. Colonel von Donop had informed the committee that he had never liked the line and had never approved of it. In its present dangerous state the Board of Trade would not allow it to be worked. A deputation from the Newcastle and District Tramway Workers' Union waited upon the committee with a request that motormen and conductors be paid time and a half for Sunday and overtime. The Tramways Committee promised to give this and other questions their careful consideration.

Bradford.—The report of the Tramways Committee for the year ended Aug. 31 states that the route mileage now worked by the Corporation is 55¾ miles. The car mileage has increased from 4,856,023 miles to 4,975,080, and the receipts have increased by £8 117. A department was inaugurated for the receiving and despatching of parcels on Jan. 1, 1905, and from that date to the week ending Aug. 31, 1905, about 300,000 parcels have been carried, which works out to a total for 12 months of 450,000, an average of 8,654 parcels per week. During this period the department has received altogether for carriage, storage, etc., £2 375. 12s. An arrangement has been made between the Yorkshire Woollen District Electric Tramways Co. and also the Halifax Corporation Tramways for the interchange of parcels. Between 300 and 400 parcels are dispatched weekly between these systems and the department, and which system is working admirably. The department has been very successful in the collection and delivery of parcels, as up to date only one parcel has been lost. Claims have been met for for damage to parcels to the extent of £5. The departmental accounts published with the report cover the period from April 1, 1904, to March 31 last. These show a revenue from traffic of £223,541, advertisements, parcel traffic, and other sources making the total income £230 085. Traffic expenses absorbed £67,226, general expenses £20,221, general repairs and maintenance £32 177, and power expenses £39,196. The balance carried to net revenue account was £70,228, of which £23 942 was applied to meeting interest on capital, and £24,491 contributed to the sinking fund, £15,623 being carried to reserve or renewals fund.

Tramways over the Bridges.—At a meeting of the Court of Common Council yesterday an important report was presented by the Bridge House Estates Committee on the question of overbridge tramways and the widening of Blackfriars Bridge, recommending that the

Digitized by Google

structure should be widened to the extent of 40ft. The committee also recommended that the following conditions should be imposed: (*a*) that the proposed widening of Blackfriars Bridge is conditional on the London County Council obtaining powers to run trams over Westminster and Blackfriars Bridge *viâ* the Embankment, otherwise the Corporation may abandon the scheme; (*b*) that the cost of any widening that may be required on the southern approach to the bridge shall be paid for by the London County Council out of tramways account, and not out of improvement account; (*c*) that the London County Council agree to construct and pay the cost of a subway for foot passengers under the roadway at the northern end of Blackfriars Bridge, the site thereof to be settled by the Corporation, such subway to belong to, and be maintained, lighted, and policed by the Corporation; (*d*) that the London County Council agree to pay an annual rent, the amount of which shall be mutually agreed upon, for a way-leave over the widened bridge; (*e*) that the City police shall have complete jurisdiction and control of the tramway traffic within the City boundary; (*f*) that the trams shall not stop on the bridge, nor within 25 yards of the ends thereof, to set down or pick up passengers; (*g*) that the London County Council regulation of 60ft. between each tramcar shall be maintained; (*h*) that no responsibility whatever shall attach to the Corporation for or concerning cables, rails, or cars, nor for any accidents that may occur in connection therewith.

Belfast.—At last week's meeting of the Tramways and Electricity Committee the question as to the charges which might be made upon the tramway undertaking by other spending departments was discussed. The General Manager explained that the late tramway company paid to the general fund of the Corporation the annual sum of £3,961. 14s. 2d. as rent for that portion of the Belfast tramway system known as the Corporation tramways. For this consideration the Corporation undertook to maintain in repair and good working order the paving, rails, sub-structure, and other works, conveniences, and parts of the tramway. The tramway department still continued to make their annual payment of £3,961. 14s. 2d. to the general fund of the Corporation, and he considered that the repairs of this portion of the system should be carried out by the Works Committee, and the cost charged to the general fund of the Corporation and not to the tramway department. With respect to the harbour tramways, it was resolved that the Harbour Commissioners be informed that the committee are prepared to recommend the Council to enter into an agreement with the Commissioners for the working of the proposed tramway, paying to the Commissioners by way of rent a sum equal to 3¾ per cent. on the cost of the construction of tramway No. 23 which has been estimated at £16,000, the tramway to be constructed and maintained by the Commissioners, and the agreement to be for a term of 15 years. The city surveyor reported that the work of which he had charge was progressing favourably, and he hoped that the opening of the greater portion of the electric tramway system would take place on Nov. 18. It was resolved to inform the Board of Trade that the committee would like to have the lines inspected this month.

Stalybridge.—The formal opening of the Stalybridge, Hyde, Mossley, and Dukinfield joint tramways took place last Monday, when members of the four Corporations, together with the chief officials, made a thorough inspection of the plant and car-sheds, and then traversed a portion of the tramway route. The total route length of track is 21 miles 390 yards, of which 6 miles 667 yards is double line. The gauge is the standard 4ft. 8½in., uniform with the gauge of the adjoining tramway systems. The length of line constructed is about 25 miles, and a further two miles is authorised. The system of generation comprises a main generating station and four sub-stations. Electricity is generated at 6,000 volts three-phase alternating current at 40 periods. This is transmitted to each sub-station, at which it is transformed, and then distributed as direct current to lighting and tramway feeders. Each of the four towns has a complete lighting network of mains. The scheme has cost £430 000. The general contractors for the main generating station were Storrs, Sons, and Co., and for the car-shed Saxon Bros. and Co., both of Stalybridge, while the whole of the steelwork for both was carried out by E. F. Blakeley and Co., Liverpool. The four sub-stations—one at Hyde, Mossley, Dukinfield, and Stalybridge, each about 93ft. long by 25ft. broad (Hyde and Mossley having small car sheds attached)—have also been designed and carried out to match the main generating station, and with similar materials. The whole of the work has been carried out from the plans and under the supervision of Messrs. Huon Matear and Simon, architects, Liverpool. Mr. Ralph Lawton, Stalybridge, was clerk of the works for the main buildings and offices, and Mr. H. Merritt for Dukinfield and Hyde sub-stations. The offices in Waterloo-road, Stalybridge, were built by Messrs. Shuttleworth Bros., Stalybridge.

London County Council.—At the usual weekly meeting of the Council, held last Tuesday, the Highways Committee submitted a report, which will be considered next week, recommending: (*a*) that the capital vote of £10,000, approved on July 18, 1905, in respect of the supply of stoneware ducts for electric cables, required in connection with the reconstruction of the first section of the Council's (northern) tramways be cancelled; (*b*) that the estimate of expenditure on capital account of £112 000, submitted by the Finance Committee, be approved in respect of the erection of the car-sheds and sub-stations required for the electric working of the first section (equivalent to about 22½ miles of single line) of the Council's (northern) tramways, including expenditure incidental thereto; (*c*) that the estimate of expenditure on capital account of £26.000, submitted by the Finance Committee, be approved in respect of the necessary reconstruction of bridges in connection with the reconstruction of the first section of the Council's (northern) tramways: (*d*) that the estimate of expenditure on capital account of £665,600, submitted by the Finance Committee, be approved in respect of the reconstruction and equipment for electrical traction of the first section (equivalent to about 22½ miles of single line) of the Council's (northern) tramways—namely, trackwork, including rails, etc., £415 600, rolling-stock, cables, cable ducts, machinery, plant, etc., £250,000; (*e*) that the Highways Committee be authorised to obtain tenders and to take the other steps preliminary to the execution of the several works referred to in the foregoing resolutions (*b*) and (*d*). The total estimate amounts to £803,600. The County Council have completed the agreement with the North Metropolitan Tramways Co. for the acquisition of the remaining interests of the tramways lease. The Highways Committee proposes that the work of reconstructing the first section of the lines (22½ miles in length) shall be proceeded with as soon as the lines are acquired in April next. This section comprises the following lines: (*a*) Theobald's-road terminus, *via* Clerkenwell-road, Old-street, Great Eastern-street, Commercial-street, and Leman-street, to near the London Docks; (*b*) Norton Folgate terminus, *via* Shoreditch, Kingsland-road, High-street, and Stoke Newington-road, to Stamford Hill; (*c*) Aldgate terminus, *via* Commercial-road, Commercial-road East, and East India Dock-road, to Poplar; (*d*) Moorgate-street terminus, *via* Finsbury pavement and City-road, to junction with Old-street; (*e*) Holborn terminus *via* Gray's-inn-road, to junction with Theobald's-road; and (*f*) along Old street, between Great Eastern-street and Shoreditch. It is hoped to complete the reconstruction of this section of the tramways by Christmas 1906. The bridges which will require reconstruction or alteration are the following: (*a*) the bridge carrying Clerkenwell-road over the Metropolitan Railway, (*b*) the bridge carrying Commercial-street East over the Great Eastern Railway, (*c*) the bridge carrying East India Dock-road over the North London Railway, and (*d*) the bridge carrying High street, Kingsland, over the North London Railway (docks line). In view of the approaching completion of the new tramways from New Cross-road, *via* Lewisham High-road and Loampit hill and vale, to High-street, Lewisham, the Highways Committee propose to fix the undermentioned fares: ½d. fares between the Marquis of Granby public-house and Tanner's-hill between Tanner's-hill and Lewisham-road Station (S.E. and C. Railway), between Lewisham-road Station and the Obelisk, Lewisham; 1d. fares between New Cross-gate and Lewisham-road Station, between the Marquis of Granby public-house and the Obelisk, Lewisham; 1½d. fares between Rye-lane and Lewisham-road Station, between New Cross-gate and the Obelisk, Lewisham; 2d. fares between Camberwell Green and Lewisham-road Station, between Rye-lane and the Obelisk, Lewisham; 2½d. fare between Camberwell-gate and the Obelisk, Lewisham; 3d. fare between Westminster Bridge and the Obelisk, Lewisham. The committee have also recommended to the Council the acceptance of Messrs. Bolckow, Vaughan, and Co.'s tender of £31,131. 15s. for the supply of track rails and fastenings in connection with the reconstruction of the first section of the Council (northern) tramways,

LIGHTING AND GENERAL.

Willesden.—An inquiry has been held into the application for sanction to borrow £20,000 for electricity purposes.

Gelligaer.—The Rural District Council are discussing an electric lighting scheme and the question of appointing a consulting engineer.

Cumberland.—The County Council have received sanction to borrow £5,300 to defray the cost of the electric installation at Garlands Asylum.

Change of Address.—The office of Mr. J. Wilkinson, tramways electrical engineer, Hull, has been removed to Queen's Dock-chamber, Alfred Gelder-street.

Dewsbury.—The Local Government Board have declined to allow a longer period than 18 years for the repayment of the loan of £9,762 for electric lighting purposes.

Bexhill.—The Town Council at their last meeting rejected a resolution moved by a member of the Electricity Committee of the Council, that gas should be used in lighting one of the streets.

Chelmsford.—The Town Council's contract with the Chelmsford Electric Lighting Co. has expired, and the Lighting Committee have decided to recommend the Council to renew the agreement.

Bethnal Green.—It is reported that the Borough Council propose to obtain their electricity supply from either Shoreditch or Hackney, or both, instead of having an independent supply of their own.

Calcutta Electric Supply Co.—The number of units delivered to consumers during the five weeks ending Sept. 29, 1905, were 546,086, compared with 433,985 in the corresponding five weeks of the preceding year.

Elgin.—A resolution to the effect that the Council apply for a provisional order for the introduction by the Council of a system of electric lighting has been deferred until the receipt of the engineer's detailed report.

Easthampstead.—A deputation of the Rural District Council is about to confer with the Camberley Electric Supply Co. with reference to their proposed application for a provisional order to supply electric light in the district.

Pontardawe.—The Council last week discussed the report of Mr. John Morgan, Cardiff, on the lighting of the Pontardawe area with electricity. Mr. Morgan's estimate is £32,000. A resolution to apply for a provisional order was lost.

Ipswich.—The units generated during the past six months amount to 564,428, against 537,732, and a much increased proportion of this current has been supplied for lighting purposes, the total number of consumers having increased from 165 to 258.

Swanage.—The special committee on the question of electric lighting in the Swanage district reported at the last District Council meeting that they had decided not to make any formal report to the Council until after they had met Mr. Renwick.

Torquay.—The inquiry announced in our issue of Oct. 27 into the application of the Corporation for sanction to a loan of £9,500 for the

Digitized by Google

extension of the existing electricity station, to supply additional current for working the tramways, was held on Nov. 1.

Hull.—The chairman of the Telephone Committee (Councillor Brown) on Tuesday, in submitting a statement of the receipts and expenditure connected with the telephone undertaking for six months ending Sept. 30 last, stated that this was now a paying concern.

Brynmawr.—The District Council have decided that before proceeding further with the proposed electric lighting scheme for the district, the Nantyglo and Blaina Council be invited to attend a joint conference as to the undertaking of a joint scheme for these two areas.

St. James's and Pall Mall Electric Light Co.—The amount of electricity sold by this company for the quarter ended Michaelmas is stated at 1 375,210 units, estimated to produce £20,055, as against 1,238,880 units, which produced £19,306 for the corresponding period last year.

Bolton.—We understand that at the last Council meeting an amendment rejecting the application of the Co-operative Society for permission to lay an underground electric cable for their premises in Bridge-street to Bark-street—a matter to which we have already referred—was lost.

Agency.—Mr. Jens O·ten-Böving has opened offices at 72, Victoria-street, Westminster. S.W., as consulting engineer and representative of leading engineering firms, and has secured the agency of the large and well-known firm of Escher, Wyss, and Co., Zurich, for the United Kingdom and Colonies.

Cheshunt.—The request of the North Metropolitan Electrical Supply Co. that the Council consent to an application for a new provisional order constituting the company the undertakers instead of the Urban District Council is under consideration, and a modified agreement is being drawn up.

West Hartlepool.—An inquiry has been held into the Town Council's application for sanction to borrow £5,000 for the extension of mains to enable them to provide power for various works, and in particular to the Seaton Carew Ironworks, with which an arrangement has been made for the supply of 300 h.p. or 400 h.p. per annum.

Barking.—We learn that great progress has been made in this district with regard to the supply of electricity for power purposes, as owing to the fact that the Council have been able to offer current at 1d. per unit, no less than 90 per cent. of the power users in the district have adopted electric motors for driving their machinery.

Swindon.—The electrical engineer's last report shows that the number of consumers connected on Oct. 15 was 398, as compared with 245 a year ago. The number of street lamps converted to date was 187, as against 157 at this time last year. The engineer has been authorised to purchase a water-tight disconnecting box at a cost of £7. 10s.

Mynyddislwyn.—The District Council have adopted a resolution in favour of the application of a private company for authority to supply electric light in the district provided that a clause be inserted in the private order reserving to the Council the right to purchase at the end of either 7, 14, 21, or 28 years from the date of confirmation of the order.

Dunfermline.—The Town Council have passed a resolution to apply to the Board of Trade for a provisional order authorising them to supply electricity for public and private purposes within the municipal or Royal burgh of Dunfermline, and also within certain other areas not included within but which adjoin the boundaries of said burgh.

Lanchester.—The Guardians have referred to the Building Committee a statement compiled by the architects (Messrs. Newcombe and Sons, Newcastle) of the cost of lighting the workhouse, cottage homes, and other buildings with gas and electricity. The electric installation was put down at £1,725. The report was referred to the Building Committee for further consideration.

Stourbridge.—The District Council have passed a resolution instructing the Electric Powers Committee to lay before the Council a scheme for generating electric current for the town, and that the company which had obtained certain electric powers should be asked within seven days what favourable terms they were prepared to give the Council before other steps were taken.

Storage Batteries. — The Electrical Power Storage Co. inform us with regard to their increase of 5 per cent. in all their catalogue prices for complete cells, renewals, and plates, that this increase has been necessitated by the continued advance in the prices of raw materials, especially lead, during the past few months, and that it applies to all their outstanding estimates.

Oldham.—An inquiry has been held into the application of the Borough Council for a loan of £48,114 for the purpose of defraying expenses in connection with the electricity undertaking. Mr. Harold Cliff, on behalf of the Oldham Master Cotton Spinners' Association, and Mr. S. Wall, for the Ratepayers' Association, took exception to several items. We deal with this matter further in another column.

Southwark.—The Borough Council have adopted a report of the General Purposes Committee on the municipal supply of electricity in bulk, stating they could not recommend the Council to send delegates to a suggested conference in relation to the subject, and recommending that the Council express an opinion that any legislation for the supply of electricity in bulk should be initiated by the London County Council.

Finchley.—The Highways Committee have been considering for some time the question of lighting certain of the street gas lamps by the incandescent system, and have received an offer with reference thereto from the North Middlesex Gas Co. The matter has been referred to a joint committee of the Highways and Electricity Committees for consideration and report, so as to give the latter committee a chance to better the offer.

Pontnewydd.—The Redbrook Tinplate Co. have started new mills and new cold rolls. The mills and cold rolls, which were made by Messrs. Richards and Hopkins, engineers, Caerleon, are driven by electric power obtained from the South Wales Electrical Distribution Co.'s works at Cwmbran, and we understand are the first tinplate mills and cold rolls to be driven by electrical power. The directors propose, if the experiment proves a success, to drive the whole of their mills and cold rolls by electricity.

Stepney.—The Borough Council have approved an arrangement whereby Messrs. Cloke Bros. are to pay the Council the sum of 9d. for every ton of clinker and ashes drawn from the electricity works and passed into the clinker-crushing plant of the works department, and the Electric Lighting Committee are to pay the Works Committee at the rate of 7d. per ton in respect thereof. The Council have accepted the tender of Messrs. Cloke Bros. for the removal of rubbish and fine dust for the period of one year from Oct. 1, 1905.

Bettws-y-Coed.—The Bettws-y-Coed Council have accepted the invitation of a local syndicate to apply for a provisional order for the lighting of the district by electricity. The syndicate undertake to bear all legal and other expenses incurred on condition that they be given the first refusal to the carrying out of the scheme. Under the agreement the company undertake to have the scheme carried out within 18 months, failing which the order, with benefit of any existing right and contracts relating to the scheme, will revert to the Council free of expense.

Manchester.—At the inquiry noted in our last issue into the application of the City Council for powers to borrow a further sum of £60,000 for additional equipment at the distributing and balancing stations, etc., it was stated that the chief items were as follows: additional plant, £22,295; the railway in the Stuart-street station, £17,850; distributing and balancing stations, £14,285. These extensions were needed to enable the Corporation to deal with the increasing demand for supplies of electrical energy for lighting, power, and traction purposes both within the city area and the outlying districts.

Edinburgh.—The City Council on Tuesday adopted a report of the Electric Lighting Committee recommending the provision of condensing plant at Dewar-place station at a probable cost of £13,000 and at M'Donald-road station at a probable cost of £23 500, and that the engineers be instructed to prepare the necessary specifications and drawings; further recommending authority to make arrangements with the North British Railway Co. to take water from the Union Canal for condensing at Dewar-place station, and that provision be made in the forthcoming Bill to be promoted in Parliament for powers to take water from the Water of Leith for condensing at M'Donald-road station.

Ossett.—Minutes of a special meeting of the General Purposes Committee containing a letter from the Board of Trade revoking the Ossett electric lighting order were submitted at the last Council meeting. The committee asked the Board of Trade to reconsider the matter, and resolved that the scheme prepared by Mr. A. E. Mottram, gas manager, be adopted, and that application be made for power to borrow £3,500, the estimated cost of the scheme. Amendments that the minute alluding to the adoption of Mr Mottram's scheme be referred back to committee, and to ask the Yorkshire Electric Power Co. on what terms they would supply electricity in bulk were defeated, and the minutes were confirmed.

Mechanical Stokers.—A detailed account of the economies and other advantages resulting from machine firing was recently given in a paper read before the Keighley Association of Engineers, Keighley, by Mr. A. W. Bennis. We are informed that a free copy of the lecture may be obtained on application to Messrs. Ed. Bennis and Co., Little Hulton, Bolton. In this connection we note that the Hever Castle power station, Hever, Kent, is about to be fitted with an installation of four Bennis stokers and natural-draught furnaces for their Lancashire boilers. The same observation applies to the Midland Electric Corporation for Power Distribution, Wolverhampton, who have placed an order with the same makers for three stokers and compressed air furnaces for water-tube boilers.

St. Pancras.—The last report of the Electricity and Public Lighting Committee shows a large number of new applications for current. Application has been made to the London County Council for a loan of £1,464 for a period of 42 years and £410 for a period of 10 years, being the balance of expenditure on electricity capital account for the year ended March 31, 1905, to be repaid on the instalment system. A reply has been received stating that, subject, so far as the sum of £1,464 is concerned, to the Council agreeing by resolution to provide out of a sinking fund established for the purpose or from maintenance account for all renewals and replacement of any of the works, plant, and machinery provided, they are prepared to advance the sum of £1,874 applied for upon the terms that it is taken up at once and repaid by equal annual instalments, as noted above.

Islington.—With regard to the proposed conference convened for the purpose of considering the question of a municipal bulk supply of electricity, the Council have decided that the secretary of the conference be informed that though not prepared to introduce a Bill for Islington, the Council will support any action which is taken by the London County Council or by any other metropolitan borough council to enable municipalities to give a bulk supply of electricity on the lines indicated in his letter; and that a petition under the seal of the Council be presented to the Government, urging that the Supply of Electricity Bill may be passed into law in the next session of Parliament. A low-tension distributing main is to be extended at a cost of £95. In consequence of the prevalence of lack of employment, it is proposed that £5,000 of the profits realised by the electric lighting undertaking be used for the purpose of paying wages only for work that can be commenced forthwith.

Digitized by Google

Award.—The Stirling Boiler Co., Motherwell, have been awarded a diploma and gold medal for their exhibit at the Naval, Shipping, and Fisheries Exhibition at Earl's Court. This exhibit included a marine Stirling boiler of 280 h.p. Part of the casing was removed to show the arrangement of the drums and tubes in the boiler. The boiler was lined with diatomite brick, which caused considerable interest, and it is claimed that it has a great advantage over ordinary firebrick, being a much more efficient non-conductor, and at the same time only one-seventh of the weight. The various tube cleaners used for cleaning the tubes of the boilers were also on exhibition. One of the tubes was split from end to end and a turbine cleaner inserted, thus showing how this efficient cleaner is worked. We are informed that similar boilers to that exhibited are at present in service in merchant vessels and shallow-draught steamers, etc.

Brighton.—The consulting engineer, Mr. Arthur Wright, has informed the Lighting Committee that the contractors had carried out quite satisfactorily the very difficult work of laying down the Southwick engine-room floors and turbine foundations, and that the basement floor had been proved to be perfectly watertight under the highest tides. The two completed turbines and the converters had been proved to run very satisfactorily, and he expected in less than a fortnight the Southwick plant would be in a position to continuously supply a very considerable portion of the electricity consumed in Brighton. There was no doubt that as soon as the coal-handling plant was installed, and the necessary reorganisation of the staff had been completed, very substantial economy would be effected in the cost of generating electricity for Brighton. A certificate has been issued for the payment of £60,221 on account of machinery supplied to the station by the British Westinghouse Co.

Hammersmith.—The last report of the Electricity and Lighting Committee shows that the premises of 20 additional consumers, representing a maximum of 350 8-c.p. lamps, have been connected to the mains, that five consumers have been disconnected, and that the present number of consumers taking current from the mains is 1,705. Extensions of mains are to be carried out at an estimated cost of £230. The committee estimate the annual revenue from these mains at £240, but this probably includes an expenditure of £371 previously sanctioned with regard to one of these extensions. The electrical engineer has reported that he is unable at the present time to vacate the rectifier house to enable it to be pulled down in accordance with the terms of the contract for the erection of additions to offices, etc., at the electricity works. In order to avoid a complete stoppage of the work, it has been arranged that the contractors shall proceed with the erection of the outer wall, and to postpone pulling down the rectifier house and laying the intermediate floor.

Hanley.—The last report of the Electric Lighting Committee shows that the total supply to private consumers for the six months ending June 30, 1904, was 311,939 units, compared with 321,200 in the first six months of this year. Taking the same months for public lighting, the supply was 86 397 last year and 89,247 for the first six months of this year. The total for the six months of last year was 398 336 units, compared with 410,447 this year. Mains are to be laid along Stoke-road from Newlands-street chamber, upon a guarantee of £150 per annum being received, along Franklyn-street from Leek-road, along Botteslow-street from Leek-road, and, if necessary, along Melville-street, to enable several applications to be complied with. The question of providing motors in a works close to Bucknall New-road has been deferred, but it has been agreed to lay the new high-tension feeder and spare conduit pipes along Waterloo-street into the Wellington-road Schools, thereby opening up a new district and utilising the Derby-street transformer chamber, when extended for the control of such main, instead of laying the same along existing route of cables in Bucknall New-road as first suggested.

Leek.—The Electricity Committee have decided that the local work for the committee be divided amongst the tradesmen of Leek each quarter. The committee had under consideration the following revision of prices for current to consumers who prefer to pay on a flat rate instead of maximum rate: suggested power rates for consumers whose installations do not exceed 20 b.h.p.—first 1,000 units consumed per quarter, 2d. per unit; second 1,000 ditto, 1½d.; all in excess of 2,000, 1½d. For consumers whose installations exceed 20 b.h.p. special terms can be arranged. Suggested flat rate charges for current as an alternative to the maximum demand system, based upon the prices obtained from the various classes of consumers during the past 12 months, are as under: offices, warehouses, and mills, 6d. per unit; shops, 5¾d. per unit; combined shops and private houses, 5d. per unit; private houses, 4½d. per unit; public houses, hotels, and clubs, 4d. per unit. These rates were approved at the last Council meeting, at which the engineer reported that the number of 8-c.p. lamps connected during the month was 785. The quotation of the National Telephone Co. for telephone connection of the generating station with the exchange at £6. 16s. per annum was accepted.

Fulham.—The Council have received a letter from the comptroller of the London County Council on the subject of the application of this Council for sanction to borrow the sum of £67,328 in connection with electric lighting extensions, stating that the Finance Committee have not yet arrived at any decision upon the application, and desire in the first instance to be informed whether the Borough Council have considered what would be the effect upon the Borough Council's electricity undertaking of the passing of any Bill for the supply of electricity in bulk in the Borough Council's area, such as the Administrative County of London and District Electric Power Company's Bill of last session. The borough treasurer has replied, intimating that the Borough Council has committed itself to carry out various necessary schemes of extension of the electric lighting undertaking to the full extent of the amount of the loan applied for, and, in fact, has already spent about £25,000 in connection therewith; therefore, the passage into law of any Electricity Bill such as referred to could not be considered in the direction indicated in respect of the present application. Subsequent to the above correspondence, we understand the Finance Committee of the London County Council has recommended that body to advance this Council the sum of £25,000 on account of the loan referred to, in accordance with the application.

Glasgow.—Last week the Electricity Committee of the Corporation visited the Port-Dundas station, the largest in the city, and inspected the two 4 500-h.p. turbines built by Messrs. Willans and Robinson, of Rugby, coupled to alternators built by Messrs. Dick, Kerr, and Co., of Preston. The length of the turbine and generator is about 38ft., the breadth about 10ft., and the height of the turbine alone, exclusive of condensing plant, is about 8½ft. The number of fixed blades in turbines is 45,730, and of rotating blades 45 730. It was stated that the turbines cost about one-half the price of the reciprocating slow-speed engines producing the same horse power, and occupy one-half the space. The equipment of this station now consists of nine reciprocating engines, varying in horse-power from 400 to 2,400, and representing collectively 10 050 h.p., and two turbines of 4,500 h.p. each, making a grand total in the works of practically 20,000 h.p. The reciprocating engines are coupled direct to low-pressure dynamos generating continuous current at 250 and 500 volts. The turbines are coupled to high-pressure alternators which generate three-phase current at a pressure of 6 500 volts. This current is transmitted to the sub-stations, where it is transformed to continuous current at 250 and 500 volts by means of motor generators. The low-pressure switchboard is in the engine-room. The switches for the high-pressure current are placed in a separate building for safety, but operated from the engine-room. A small battery-room is provided on each side of the entrance hall.

London Gazette.—The partnership between Thomas Rickard Bawden Nunn and Franks Herbert Watts, carrying on business as electrical engineers at 82, Mark-lane, London, has been dissolved by mutual consent. The partnership between Elizabeth Hahner and Max Wolff, carrying on business as telephone importers, dealers, and erectors, under the style of the Empire Telephone Co., has been dissolved by mutual consent. A receiving order has been made out on debtors' petition in the estate of Harry Jones and Gwilt Lloyd Cathrall, plumbers and electrical engineers, 19, Chester-street, Wrexham. Notice of substituted service appears in the estate of William G. Leather, trading as the Windus Electric Co., Sheffield, on the petition of the Union of London and Smith's Bank, 2, Princes street, London, E.C. The application is to be heard on Nov. 3 at 2 p.m. at County Court Hall, Sheffield. A first and final dividend of 6d. in the £ has been declared in the estate of Alexander Holland, electrical engineer, and trading as the Electrical and Mechanical Engineering Co., Bridgewater-street, Farnworth, Lancashire. The following applications have been made to the Light Railways Commissioners: (1) by the promoters of the Bath and Lansdown Light Railways Projects Limited, for power to make alterations in the line of the proposed railways and to widen High-street, Weston; (2) by the Barking Urban District Council to lease the line within the urban district from the boundary of the district at Loxford Bridge, adjoining the tramways of the Ilford Urban District Council, along Ilford-lane and Fanshawe-avenue to the junction of that avenue with Longbridge-road.

London County Council.—On Tuesday it was agreed to lend the Battersea Borough Council £9 792 for electric lighting, Islington Borough Council £4 308. 4s. 4d. for street-lighting purposes, St. Marylebone Borough Council £90 405, the Fulham Council £25 000, the Hampstead Council £6,000, and the Stepney Borough Council £10,000 for electric light installations. On Nov. 14 the Council will consider the following recommendations of the Highways Committee: "(*a*) That the operation of standing order No. A 161, relating to the time for the submission to the Council of schemes involving application to Parliament be suspended, in order that the following recommendations may be considered: (*b*) That authority be sought in the session of Parliament of 1906 (1) to enable the Council to supply electrical energy in London and certain surrounding districts on the lines indicated in the report of the Highways Committee dated Oct. 23, 1905; (2) to confer upon the Council power to carry out any necessary works, including the erection of buildings, the laying of mains, etc., necessary to give effect to such powers; (3) to empower the Council to make arrangements with local authorities and others having power to supply electrical energy, and to enter into agreements to give effect thereto; and (4) to confer upon the Council any general powers which may be necessary to enable it effectively to supply electrical energy. (*c*) That the costs and expenses of promoting the legislation referred to in the foregoing resolution be defrayed out of the county fund." The application of Mr. Highfield, on behalf of the Metropolitan Electric Supply Co., for the erection of a sub-station on the southern side of Randolph-mews, Portsdown-road, Paddington, was agreed to.

Bradford.—The report of the Electricity Committee upon the work of the department during the past year states that the committee are laying 16 additional lighting feeders for the purpose of augmenting the capacity of the consumers' networks in various parts of the city. Fuses are being put in for the purpose of dividing the distributing mains into sections corresponding approximately to the different feeders. The committee have given instructions for the augmentation of the supply to the tramways by the laying of four additional feeders on the present system of supply, and the erection of two sub-stations upon the extra high-tension system of transmission. In consequence, the tramways distribution system will be divided into 19, instead of eight, sections, as at present, and in the event of a feeder breaking down the inconvenience caused to the travelling public will be greatly reduced, and a more even pressure of distribution obtained as supplementary advantages to the primary object of the expenditure. It having been decided to supply the districts outside the present area of supply by means of extra high-tension feeders, sub-stations are arranged for at Thornbury and Odsal Top, and transformer chambers in Wakefield-road and Hoxton. These will be supplied with current at 6,500 volts derived from motor-generators at the works for stepping

Digitized by Google

up the low-tension continuous current to extra high-tension three-phase current. It has also been decided to lay a number of extra high-tension feeders for general supply purposes on this system for both transmission and distribution to several of the outlying portions of the city. The Board of Trade consent to the adoption of this system has recently been received. The rates of charge have remained unaltered during the year, and the number of consumers has increased 6½ per cent., or from 1,925 to 2,049.

Exeter.—The City Council have adopted an interim report of the joint conference of the Lighting Committee and the Electricity Committee. The Council had previously decided to light the streets along the tramway route by electricity. The report states that the present annual cost of gas lighting is £4,210 and of electric lighting £850, and that to substitute electric light for gas throughout the whole area of the city would necessitate 1,214 lamps and the laying of cables in 27½ miles of streets, at a capital outlay of £10 381. The total annual cost would be £4,831. The recommendations were as follows: (1) that in the streets through which the tramlines are laid—excepting those already lighted by electricity—arc lamps should be suspended from the tramway poles and fixed to every alternate pole; (2) that in Queen-street and the main street from St. Anne's Chapel to the St. Thomas side of the bridge, the new golden-flame arc lamps be fixed to existing columns—28 lamps being substituted for the existing 37; and that the remaining length of streets be lighted by incandescent electric lamps, spaced about 55 yards apart. Another estimate gave the cost of converting the 300 or 400 gas lamps into incandescent electric lamps, and of providing 45 new arc lamps, including the 28 golden-flame lamps, at £2,000, and the annual maintenance at £3 264. The cost of the 13 miles in which cables are already laid would thus be increased by 43 per cent., and the candle-power by 235 per cent. The electrical engineer and the surveyor in the report remark that to obtain an equal effective candle-power with incandescent gas lamps would, on any system they were acquainted with, cost at least £4,000 per annum. A special committee has been appointed, with instructions to request the gas company to also submit a scheme for lighting the streets other than those through which the tramways run, with an estimate of the cost and the candle-power to be obtained.

Croydon.—At the last Council meeting a petition was read from residents in Penge-road, South Norwood, requesting that, in connection with the tramways extension through that road, electric arc lamps should be provided for street-lighting. The Council have already adopted this form of lighting for Penge-road at an estimated cost of £417. The committee will provide a main for this purpose in connection with the tramway feeder, and by reason of the cables for electric light being laid at the same time as the tramway cables, the estimated cost is reduced to £220. In connection with the construction of the tramway authorised by the Croydon and District Electric Tramways Acts, 1902-3, the committee have had before them a report from the borough electrical engineer for lighting the whole of the tramway track along Mitcham-road, from Pitlake to the borough boundary, by means of 32 magazine flame arc lamps, at an estimated cost of £882, a considerable saving in the cost being effected by this work being carried out simultaneously with the construction of the tramways. This extension would overcome a difficulty which has arisen and prevented the borough hospital being lighted by electricity, and would also make provision for a further supply in this neighbourhood, which will shortly be opened. The committee recommended that the tramway route be lighted by electric arc lamps as suggested, that the works be carried out simultaneously with the tramways construction, and that the cost be charged against the loan of £20,000 already sanctioned by the Local Government Board for the extension of electric mains. This was agreed to. The following resolution, which was discussed at two previous meetings—viz., "That the further consideration of the report on street-lighting be reconsidered at a future meeting of the Council, and that, in order that the matter may be fairly considered, the Lighting and Electricity Committee be requested to obtain from the Croydon Gas Co. and from the South Suburban Gas Co. respectively offers for the efficient lighting of the borough, and to submit such offers to the Council"—was negatived.

Newcastle.—The report of Mr. Ernest Hatton, manager of the Corporation tramways, upon the letter sent to the committee by the secretary of the Newcastle and Gateshead Gas Co., has been printed for circulation amongst the members of the Electric Lighting Committee. Mr. Hatton points out that the average number of hours each of the existing arc lamps now burns annually is 2 793, and the average number of hours each gas lamp burns is 3,776. The fact that gas lamps burn 983 hours longer than the electric arc lamps has always been a strong argument in favour of lighting streets by gas regardless of the extra amount of light given by each arc lamp during the hours such lighting is most required—namely, up to midnight. In the report submitted by the secretary of the gas company he had given a revised estimate of 2,793 hours per lamp per annum, or a reduction of 983 hours per lamp less than the hours specified in the report submitted by the superintendent of street-lighting, wherein it was stated that the rate per cent. of hours of burning for gas lamps over electric arc lamps was 35·18 per cent. The committee will have a large number of gas lamps burning 3,776 hours per lamp per annum, and 206 gas lamps burning 2,793 hours per lamp per annum. The secretary of the gas company pointed out that if it was decided to keep the whole of the 206 gas lamps burning all night or every alternate lamp burning all night, the additional cost to the city would be 14s. 2d. per lamp, increasing the cost per gas lamp from £3. 5s. 6d. to £3. 19s. 8d. per lamp per annum, or 2s. 1d. less than the amount provided in the report submitted by the superintendent of gas lighting—namely, £4. 1s. 9d. It is, therefore, somewhat difficult, Mr. Hatton says, to give a comparison between electric lighting and these altered circumstances of gas lighting, unless the committee previously decides how many hours per lamp per annum the proposed new lamps are to burn, but he endeavours to show the results on each basis. Assuming the extensions are carried out with 180 additional arc lamps, each burning 2,793 hours per annum, including the reduction that will be made to the committee in the existing arc lamps, he gets 360 arc lamps of 1,000 c.p. at £11 net per lamp per annum, costing in all £4,180; secondly, assuming the extensions are carried out with 206 new type gas lamps, each burning 2,793 hours per annum, he gets 200 1,000-c.p. arc lamps, for which the committee now pays £14. 18s. 6d. per lamp per annum, in all £2 980, and the cost of 206 new type gas lamps at £3. 5s. 6d. per lamp per annum, £674. 13s.—in all, £3,654. 13s., or with discount, £3,565. 11s. 9d. This is £614. 8s. 3d. less than lighting the same length of streets by arc lamps; but it must be noticed that the hours of burning for each gas lamp on this estimate has been reduced by 983 hours per lamp per annum. Assuming the extensions are carried out with 206 new type gas lamps, each burning 3,776 hours, he gets 200 1,000 c.p. arc lamps, for which the committee now pays £2,980; to which is to be added £820. 11s. 4d., the annual cost of 200 new type incandescent gas lamps, each burning 3,776 hours per annum, making in all £3 800. 11s. 4d., or with discount, £3,711. 10s. 1d. This is £468. 9s. 11d. less than lighting the same length of streets by electric arc lamps. Mr. Hatton refers the committee to what he has previously reported on the respective merits of electricity and gas for street-lighting, together with the benefit that would accrue to the ratepayers by utilising the existing plant in the power station for the purpose of generating the necessary units for the proposed 180 additional arc lamps. Mr. Hatton, in conclusion, gives a table of photometric measurements, showing that the candle-power of the arc lamps is fairly constant, while for incandescent gas lamps similar tests reveal an extremely varying candle-power, according to the condition of the mantles.

PROVISIONAL PATENTS, 1905.

OCT. 23.

21466. Carbon-holder for arc lamps. Herbert Edmund Moul, 18, Kensington Court-place, London.

21478. Improvements in electrical terminals and connections. Alan John Downes, Redvers Villas, Writtle-road, Chelmsford, Essex.

21480. Improvements in electrical ignition devices for internal-combustion engines. Henry Capel Lofft Holden, 2, St. John's-park, Blackheath, London.

21485 Improvements in electrical switches. The Electric and Ordnance Accessories Company, Limited, and Robert Frederick Hall, 24, Temple-row, Birmingham.

21487. Improvements in letter-box plate for letter box and electric bell push combined. Daniel Timmins, 5, Clevedon-terrace, Ridgeway-road, Fishponds, Gloucestershire.

21519. Improvements in supports for electric incandescent lamps. Mabel Annie Cox, Hawthorn Cottage, Vale of Health, Hampstead, London.

21521. Improved coil trembler for electrical ignition apparatus of high-speed engines for motorcars and similar vehicles. Sidney James Williams, 149, Strand, London.

21523. Improved form of prepayment electricity meter. Harry Francis Jackson Thompson and John Horace Bowden, 10, Eastcombe-avenue, Charlton, London.

21533. Improvements in the manufacture of active iron mass for the electrodes of alkali accumulators. Ernst Waldemar Jungner, 31, Bedford-street, Strand, London.

21534. Improvements in the manufacture of electrodes for electrical accumulators by means of continuously operating machines and in the electrodes and accumulators thus manufactured. Ernst Waldemar Jungner, 31, Bedford-street, Strand, London. (Date applied for under Patents Act, 1901, June 10, 1905, being date of application in Sweden.) (Complete specification).

21535. Improvements in or relating to insulation for accumulators with alkaline electrolyte. Adolf Emanuel Berglund, 31, Bedford-street, Strand, London. (Date applied for under Patents Act, 1901, March 15, 1905, being date of application in Sweden.) (Complete specification.)

21585. Improvements in telephonic apparatus. Joseph Devonport Finney Andrews, 2, Park-avenue, East Sheen, London.

OCT. 24.

21581. Improvements relating to trolley poles of electric tramcars or the like. James Hunter Collie, 34, Castle-street, Liverpool.

21583. Automatic starting resistance for electrical motors. Ernest Bolton, 12, Beaconsfield-square, Hartlepool.

21615. Improvements in or in connection with the cells of electric accumulators, applicable also for other purposes. Alexander Battersby, 3, Brown-street, Market-street, Manchester.

21652. Improvements relating to electric motors. Henry Harris Lake, 7, Southampton-buildings, London. (International Holding Company, United States.) (Complete specification.)

21648. Improvements in or connected with fuse boxes. W. T. Henley's Telegraph Works Company, Limited, and William Henry Nichols, 53, Chancery-lane, London.

21658. Improvements in or relating to electric motors, dynamos, electromagnets, and other machines or apparatus comprising an electrically produced magnetic field. Auguste Védrine and Count Raoul de Quélen, 70, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 25, 1904, being date of application in France.) (Complete specification.)

21659. Improvements in electric road motor vehicles. Auguste Védrine and Count Raoul de Quélen, 70, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 26, 1904, being date of application in France.) (Complete specification.)

21661. Improvements relating to sound boxes for phonographs, telephones, and the like. Piotr Lebiedzinski, 7, Southampton-buildings, London. (Complete specification.)

21672. Improvements in and relating to electric meters Allgemeine Elektricitäts-Gesellschaft, 83, Cannon-street, London. (Date applied for under Patents Act, 1901, Oct. 28, 1904, being date of application in Germany.) (Complete specification.)

21675. Improvements in systems of electric motor control. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

21681. Improvements in electric shunts. Henry Stafford Hatfield and Frank Michael Lewis, Norfolk House, Norfolk-street, London.

Oct. 25.

21693. A new and improved mechanism in connection with prepayment electricity meters Francis Henry Merritt, Acrasto, Wells-street, Ryde, Isle of Wight.

21707. Protecting device for shunt field windings of electrical machines where shunt regulators are used. Thomas Edge, 34, Manchuria-road, Clapham, London. (Complete specification.)

21739. Improvements relating to electric heating or cooking apparatus. John Somerville Highfield, 322, High Holborn, London.

21752. Improvements in or relating to mechanism for making and breaking electric circuits in connection with alarm clocks, tell-tale clocks, and the like. Friedrich Kuhn, 31, Bedford-street, Strand, London.

21753. Improvements in and relating to electric resistances. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

Oct. 26.

17402A. Improvements in electric switching apparatus. Heinrich Stern and Gustav Engisch, Thanet House, Temple Bar, London. (Date applied for under Rule 5 of the Patents Rules, 1905, Aug. 28, 1905). (Complete specification.)

21761. Improvements in and relating to electric conductor rail insulators. William Vernon Bonsor, 36, Redcliffe-road, London.

21795. Improvements in or relating to electrically synchronised clocks. Frederick Augustus Chandler and Bahne Bonniksen, 18, Hertford-street, Coventry.

21798. Improved system of armoured insulated conduit for running uninsulated electrical conductors. Herbert Hugh Clements, 43, Cannon-street, London.

21804 A new or improved vacuum receptor or apparatus for the production of violet or ultra-violet rays, X-rays, or other rays, or combination of rays by induction on low-tension currents. John Hendry Phelps and John Cunningham Bowie, Birkbeck Bank-chambers, Chancery-lane, London.

21833. Improvements in electromagnetic apparatus. John McIntyre, 53, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 29, 1904, being date of application in United States. (Complete specification.)

21834. Improvements in Ruhmkorff coils. John McIntyre, 53, Chancery-lane, London. (Date applied for under Patents Act, 1901, Dec. 8, 1904, being date of application in United States.) (Complete specification.)

21842. A new or improved method and means for neutralising deflecting forces acting on a magnet or system of magnets. Hermann Gereke, 31, Bedford-street, Strand, London. (Complete specification.)

21846. Improvements in and relating to electric telegraphy. Angelo Cipriano Boronio and Alexander Muirhead, 323, High Holborn, London.

21851. Improvements in or relating to alternating-current motors. William Allwood Dutton and the Brush Electrical Engineering Company, Limited, 46, Lincoln's-inn-fields, London.

21855. Improvements in electric power measuring and recording instruments for alternating currents. Vittorio Arcioni, Clun House, Surrey-street, London. (Date applied for under Patents Act, 1901, Oct. 27, 1904, being date of application in Italy.) (Complete specification.)

21859. Improvements in or relating to service apparatus for electric supply. William Morris Mordey and Guy Carey Fricker, 46, Lincoln's-inn-fields, London.

21856. Improvements in electric clocks. George Bennett Bowell, 40, Chancery-lane, London.

Oct. 27.

21870. An improved method of securing or attaching a wire supplying electricity to a terminal. Alfred Austin Lines, 21, Harleck-avenue, Dewsbury-road, Leeds.

21882. Improvements in electrically-driven bicycles and like vehicles. Samuel Hopkinson Parry and Harry Barrett, 3, Brown street, Market-street, Manchester.

21931. Improvements in electric arc lamps. The British Thomson-Houston Company, Limited. 83, Cannon-street, London. (General Electric Company, United States.)

21947. Improvements in and relating to dynamo-electric machines. Siegfried von Ammon, Oswaldestre House, Norfolk-street, Strand, London.

Oct. 28.

21949. Improvements relating to the manufacture of hypochlorite solution by electrolytic methods. William Pollard Digby, Trafalgar-buildings, Charing Cross, London.

22665. Improvements in insulated electric conductors. W. T. Henley's Telegraph Works Company, Limited, and Henry Savage, 53, Chancery-lane, London.

22011. Improvements relating to brushes or collectors for dynamos and motors. James Dickson, 8, Quality-court, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

Digitized by Google

NOTES.

Birthday Honour.—We are pleased to see from the list of birthday honours that Prof. G. H. Darwin, F.R.S. (president of the British Association), has been appointed a K.C.B.

Metric System.—According to the *Age* of last month, the Prime Minister of the Commonwealth of Australia has stated that a Bill is now being drafted on the subject of the weights and measures, and that probably power will be asked to introduce the metric system.

Motor Show.—The fourth international motor exhibition held by the Society of Motor Manufacturers and Traders will be opened at Olympia, Kensington, on Friday, Nov. 17, and will remain open till Saturday, Nov. 25, inclusive. The exhibition will embrace all sections of the motor industry, and a large number of manufacturers will exhibit. Electric ignition devices and electric automobiles will be well represented.

Wireless Telegraphy.—It is proposed to conduct extensive experiments with wireless telegraphy at the mouth of the Tyne. The public bodies in the locality are being invited to confer with a view to facilitating the arrangements for carrying out the experiments. At the last meeting of the Newcastle Chamber of Commerce a letter from Lord Armstrong on the subject was read, and a sub-committee appointed to confer with his lordship.

Tube Combine.—It is reported in the daily Press that negotiations on the part of Scotch and English tubemakers to form an Anglo-Scotch tube combine have not proved successful, the big Scotch companies having withheld their support. It is stated that had the proposal been made months ago, when orders were scarce and competition ruinously keen, the Scotch houses might have fallen in with the proposal, but at present they are booked heavily, and at substantial prices.

Books Received.—The "'Practical Engineer' Pocket-Book" and the "'Practical Engineer' Electrical Pocket-Book" (price 1s. each net, leather 1s. 6d.) have reached us from the Technical Publishing Company, of Manchester. These books are convenient in size, and contain much valuable data. The editors, as usual, have kept them up-to-date by revision and inclusion of new matter, and in the "electrical" book several suggestions put forward during the year have been embodied in the new issue.

Technical Education.—Mr. Wilson Worsdell, chief mechanical engineer of the North-Eastern Railway, speaking at a prize distribution in connection with the classes at the North-Eastern Literary Institute, Gateshead, last week, emphasised the importance of our youths improving themselves technically and scientifically. Sir Walter Plummer, M.P., in presenting the prizes, commented on the fact that more students had entered for electrical than for steam study. He stated that, whether steam or electricity was the motive power of the future, the North-Eastern Company would not be behind-hand, and that the works in that locality would not suffer by the consequent change.

Royal Institution.—A general monthly meeting of the members was held on the 6th inst., Sir James Crichton-Browne, M.D., F.R.S., in the chair. Lady Alford, Mr. W. Friedlaender, Dr. A. Muirhead, and Mr. D. A. Thomson were elected members. The special thanks of the members were returned to Mr. Robert Hannah, M.R.I., for his gift of the picture, painted by him, of "Master Isaac Newton in his Garden at Woolsthorpe in the Autumn of 1665." A Christmas course of lectures, adapted to a juvenile auditory, will be delivered at the institution by Prof. Herbert Hall Turner, D.Sc., F.R.S., on "Astronomy." The dates of the lectures are Dec. 28 and 30, 1905, and Jan. 2, 4, 6, and 9, 1906, at 3 o'clock.

Overhead and Underground Wires.—The dispute between the General Post Office and the Cardiff City Council respecting the laying of trunk telephone wires along the North-road was investigated by the deputy stipendiary of Cardiff, Mr. E. Milne Jones, who sat as arbitrator. It was explained that the Post Office authorities desired to remove certain telegraph wires now on the poles and place them underground, and carry overhead additional trunk telephone wires between Cardiff and Pontypridd. Mr. W. Harpur, the city engineer, said the Council would not object to all the wires being laid underground, but they were averse to there being a number of wires above ground and others underground. The deputy stipendiary reserved his decision.

Institution of Civil Engineers.—At the inaugural meeting of the eighty-seventh session of the institution, held on Tuesday, the 7th inst., Sir Guilford Molesworth, K.C.I.E., the retiring president, alluded to the loss which the institution and the engineering profession generally had sustained during the recess by the deaths of Mr. James Mansergh, F.R.S., and Mr. George Robert Stephenson (past presidents), and of Sir William Shelford, K.C.M.G. (member of council). He then formally introduced to the members his successor to the chair, Sir Alexander Binnie. Sir Alexander Binnie then delivered an address to the members, in which he traced the influence of scientific thought and investigation upon the development of engineering practice. The president subsequently presented the medals and premiums awarded by the council for papers dealt with at the institution in the course of the past session, and afterwards received the members in the library.

Photography by Telegraph. — Prof. Korn, who has devoted close study to the problem of the transmission of photographs over telegraph wires, recently communicated in a lecture to the members of the Electro-Technical Association at Munich the results of experiments which he had made with a view to perfecting the apparatus employed in the process. These were carried out on the telegraph line from Munich to Nuremberg, a distance of about 100 miles, and had satisfied him that it was possible to transmit a photograph or sketch 6in. or 7in. square in a period varying from 10 to 20 minutes, though he claimed that after improvements had been introduced in the apparatus the feat would be accomplished within five seconds. The subject has now occupied the attention of inventors for ages, and the results of Prof. Korn's investigations do not mark any considerable advance towards perfection, nor do they add to the stock of knowledge already extant on the subject.

Incandescent Lamps and Fires.—The extended use of electricity in mines gives rise to the belief that the dangers thereof are increased owing to the possibility of explosions caused by the heat from the lamp igniting the coal dust. This was demonstrated by a fire which took place at one of the collieries in the North of England some time ago. It was suspected that the heat from an electric lamp was the cause, so experiments were made by placing an incandescent lamp on the top of a pail of coal dust, in a similar position to that at the scene of the fire. Thermometers recorded a very quick rise of temperature in the coal dust, followed by combustion if the lamp was allowed to remain. Investigations were then carried on by Mr. Hall, H.M. inspector of mines, who in a report states that in one case where a 16-c.p. lamp was slightly covered with

Digitized by Google

coal dust the temperature rose to 370deg. F. in 10 minutes, and that in another case the lamp exploded at 450deg. F. in four minutes, while a temperature as high as 650deg. was registered in a third case. Mr. Hall remarks that after the coal dust has been raised to a certain temperature, spontaneous combustion commences.

Institute of Bankers.—The session was inaugurated last week, when Mr. J. Spencer-Phillips delivered his presidential address. He was able to announce that the past year had been an exceedingly prosperous one, and that the clearing-house returns, which had advanced 18 per cent. during the year, indicated a real improvement in trade conditions. The president regarded the commercial outlook distinctly encouraging, and in discussing future prospects adopted a tone of cheery optimism. He sounded a note of timely warning, however, against the dangers resulting to bankers from the competition for the deposits of the public by municipalities and other bodies, who were freed from the responsibility of keeping a large reserve of idle money, or money earning very slight interest, and could therefore offer terms which bankers could not afford to do. Bankers do not suffer alone in the limitation of their business by the growing encroachment of municipalities upon their preserves, and the time is now opportune for the whole question of municipal and private rights to form the basis of a Government inquiry.

Assessment.—We note that the appeal of the Merthyr Electric Traction and Lighting Company, which was recently heard by the Merthyr Assessment Committee, against excessive assessments has been successful. The dispute resolved into the question whether the company should be assessed on their property and rolling-stock or upon their income and expenditure. The company claimed to be assessed on the latter basis, as is done in the case of gasworks and other undertakings. At present the tramways and appurtenances were put at £2,400 gross and £1,200 rateable, and the depôt, yards, etc., at Penydarren at £600 gross and £480 rateable. They urged that 6 per cent. on the gross receipts of lighting and traction would be fair, for there was the special circumstance of an abnormally stiff gradient for the Dowlais traffic. It was stated that the expert consulted by the Assessment Committee had advised a reduction of £530, but it was eventually decided that the assessment of the entire undertaking be reduced to £864 rateable, arrived at by taking 6 per cent. on the gross receipts of the whole concern, and that relief be granted in the four half-yearly rates extending from April, 1905, to April, 1906.

Cape-to-Cairo.—The November number of the *Pall Mall Magazine* contains an interesting article on the erection of a telegraph wire from Cape Town to Cairo, and gives an historical account of the undertaking, which is now rapidly approaching completion. The author states that the experiment of adopting the Marconi system of wireless telegraphy over a portion of the route northwards from Udjidji to Rosares, where the Egyptian telegraph system has its termination, is contemplated. The country between these two places is in parts very swampy, and about 100 miles of it quite unsuited for the erection of an ordinary land telegraph. It is proposed, therefore, to carry the line as far as possible north and south of this region, and then to bridge over the intervening space with a Marconi installation. The volume of traffic over the line opened out is already considerable, and in 1903, which is the latest year for which complete returns are available, 16,470 messages, containing in all 370,214 words, were forwarded along the line, and in the same period 16,289 messages, containing 390,354 words, were received, and 15,389 messages were transmitted. It is anticipated that the completion of the telegraph will not be delayed beyond the year 1907.

German Industry.—In his report for the first half-year 1905 on the trade and industry of Germany, Mr. Consul Schwabach deals with the combines in the electrical industry. Following the two powerful combines of 1904 between the Allgemeine Elektrizitäts-Gesellschaft-Union-Elektrizitätsgesellschaft and the Siemens-Schuckert-Werke, there took place in April of this year an amalgamation of the manufacturing departments of the Lahmeyer Electrical Works, of Frankfort-on-Main, with the Felten und Guilleaume Karlswerk A.G., of Cologne, under the name of "Vereinigte Felten-Guilleaume-Lahmeyer-Werke A.G." This new concern disposes of a share capital of £2,750,000. A purchase office for electrical works has been established by 28 members of the Union of Electrical Works, which is composed of over 200 German and foreign works. The principal object of the new office is to buy for joint account materials required by electrical works, but it also collects manufacturers offers, and settles buying and delivery condition with them. Members are obliged to meet exclusively through the office their ordinary requirements for carbon-filament incandescent lamps, excepting candle lamps and abnormal globes, also of such other materials as may be decided upon at a general meeting. In this way, the consul points out, members will be provided with incandescent lamps of the best quality only, every single lamp bought through the office being previously tested.

Vaporisation of Metals by High-Frequency Discharges.—When an electric discharge from a battery of Leyden jars is sent through a wire placed between two glass plates, an excessive amount of heat may be generated in the wire in an extremely short time (a few hundred thousandths of a second), and this heat is often sufficient to vaporise the wire. The consequent increase in pressure blows the vapour out in all directions, and as it cools it is deposited in the form of finely divided metal with vacant spaces in between. The deposit near the path of the wire is so close that light is reflected from it as from a uniform surface, but a little further from the wire the deposit lies in lines at right angles to the direction of the wire with metal-free spaces between. Some tests made under these conditions and recorded photographically are described by F. Braun in the *Annalen der Physik*, p. 359, 1905. A battery of 20 Leyden jars giving a 6mm. to 8mm. spark was employed, and wires of tantalum, zinc, carbon, brass, platinum, silver, etc., were dealt with. In the case of carbon (an incandescent lamp filament) actual vaporisation did not take place, but globules of melted carbon were readily distinguishable under the microscope. In the case of alloys, by suitably adjusting the strength of discharge the several component metals could be separated—the metal of lower melting point being deposited nearest to the path of the wire.

Electro-Deposited Copper.—Prof. A. K. Huntington, in a paper read before the Faraday Society, explained that the direction of the lines of crystallisation of an electro-deposited metal are the same as in a casting made on surfaces having the same inclination—*i.e.*, the crystals form at right angles to the surface on which the deposit or the casting is made. From this he concluded that when the crystals which form on surfaces more or less at an angle to one another meet, there is a want of continuity in the two sets of crystals and a line of more or less weakness is developed. In exemplification of this, he took a casting composed of 50 per cent. copper and 50 per cent. zinc, from which it was observed that crystals from the opposite long sides, which must be approximately parallel, did not merge one into the other, but, on the other hand, showed a break.

Digitized by Google

The importance of avoiding sharp angles in castings and deposits, when strength and not rupture is aimed at, was pointed out by various examples. Prof. Huntington exhibited a number of photo-micrographs showing that when electro-deposited copper is annealed, the long crystals of the deposit are completely broken up and become largely twinned. He then compared this with a rolled copper rod which had been annealed, from which he concluded that brittleness due to the direction in which crystals form in castings and electro-deposits may be modified and probably completely removed by suitable annealing. This, however, would be the case only when there was a line of weakness and the continuity was not entirely broken, otherwise the unequal expansion caused by the heat would make matters worse rather than better.

Military Engineering.—Lieut.-Colonel Heath, R.E., discoursed on "Field Engineering in Modern War" at the Royal United Service Institute last week, and in an interesting address, insisted that the illumination at night of obstacles placed in position to impede an enemy's attack was a matter of great importance. In this connection Colonel Heath stated that a searchlight company at Aldershot had lately been experimenting, and, as electric light was not always available, they were trying acetylene lamps and acetylene flares. It had been found that these gave a fairly effective light. The lighting apparatus was placed on the obstacle and connected with the trenches by a cord, and in case of attack the flare was turned on to light up the attackers. Speaking of the difficulty of cutting wire entanglements, Colonel Heath said it was a question whether some form of steel shield could not be devised to protect the men engaged in this hazardous operation from the fire of the enemy. Bullet-proof steel weighed 8lb. to the square foot, however, and an effective shield would be very heavy. Smoke screens had been used with great success in baffling the use of the searchlight by an enemy. Bundles of straw threw out dense volumes of smoke, and, provided there was not much breeze, a searchlight was of very little effect. In advancing by entrenchments upon a position, it would be a great help to have tools which would enable men to entrench themselves while lying in the open and exposed to an enemy's fire. Experiments were being tried with a tool resembling an adze. Recently some men entrenched themselves in half an hour, while lying down, by the use of it, but still it was not a very satisfactory trial.

Obituary.—We regret to record the death of Mr. C. G. Mott, a director of the Great Western Railway Company and chairman of the City and South London Railway, which took place at Stanmore on Wednesday. Mr. Mott was 72 years of age, and during his active commercial life was regarded as one of the most notable figures in the railway world. He has not inaptly been termed the "father" of tube railways, for, with the assistance of the late Mr. Greathead, he introduced the City and South London Railway, which was the first tube railway in London. The *Evening Standard* states that in the early eighties he was invited to take an interest as a director in a company which was then being formed in the City and Southwark Subway Company, to construct a short tube line from King William-street in the City to the Elephant and Castle, to be worked on the cable system. He accepted, and became chairman. On looking into the scheme, however, he came to the conclusion that the cable system was not one which would prove workable on lines of this description, and he accordingly insisted on electricity being experimented with. There was opposition from the people already interested in the scheme, but ultimately they agreed and approved. Firms of electrical engineers were consulted, and after considerable experiments the contract was given out. At the time there were no electric railways in the world, and it was entirely owing to his enterprise and his insistence on electricity that the first electric tube railway was constructed. He found the funds, and subsequently, under his control and advice, the line was extended to Stockwell and Clapham Common to the south, and again on the north from Moorgate-street to the Angel, and is now being extended farther to Euston.

Institution of Electrical Engineers.—The Council have entered upon the agreeable task of formulating plans for the reception and entertainment next year of the kindred institutions in Europe and America. Invitations to visit Great Britain as guests of the Institution have been issued to the American Institute of Electrical Engineers, the Canadian Electrical Association, the Associazione Elettrotecnica Italiana, the Electrotechnischer Verein, the Verband Deutcher Elektrotechniker, the Schweizerischer Electrotechnischer Verein, and the Société Internationale des Electriciens. On many occasions we have associated with the above-mentioned societies abroad, and have reaped advantages which inevitably follows from such intercourse. The hospitality which has been extended to the English delegates both in Europe and America has always been on a most lavish scale, and the welcome accorded has never lacked sincere cordiality. The forthcoming visit, which will take place in June, 1906, will be the first that has been made by foreign societies to our shores, and we are convinced that as far as arrangements for the hospitality of our guests are concerned these will be well looked after by the capable secretary of the Institution of Electrical Engineers, Mr. G. C. Lloyd. It is impossible to over-rate the benefits which result from such gatherings, and the meeting in this country of representative societies from Europe and America cannot fail to stimulate the electrical industry. It remains for manufacturers and others engaged in electrical engineering to support the Institution by granting full facilities to the delegates for observing the electrical developments in this country. Now that our turn has come to extend a welcome to the kindred institutions abroad, it behoves all concerned to see that it is not lacking in that welcome and cordiality which made our visits so enjoyable and successful.

The Royal Society.—We are informed that the following gentlemen have been recommended by the president and council for election into the council for the year 1906 at the anniversary meeting on Nov. 30: President—Lord Rayleigh, M.A., D.C.L., O.M. Treasurer—Mr. Alfred Bray Kempe, M.A. Secretaries—Prof. Joseph Larmor, D.Sc., D.C.L., LL.D.; and Sir Archibald Geikie, D.C.L., Sc.D., LL.D. Foreign secretary—Mr. Francis Darwin, M.A., M.B. Other members of the council—Dr. Shelford Bidwell; Sir T. Lauder Brunton, M.D.; Prof. J. Norman Collie, Ph.D.; Prof. Wyndham R. Dunstan, M.A.; Prof. John Bretland Farmer, M.A.; Prof. Francis Gotch, D.Sc.; Dr. Sidney Frederic Harmer; Sir William Huggins, K.C.B., O.M.; Prof. Edwin Ray Lankester, M.A.; Dr. John Edward Marr; Mr. George Ballard Mathews, M.A.; Mr. Hugh Frank Newall, M.A.; Sir William Davidson Niven, K.C.B.; Prof. John Perry, D.Sc.; Prof. Ernest Henry Starling, M.D.; Prof. William Augustus Tilden, D.Sc. The following is a list of those to whom the society has this year awarded medals. The awards of the Royal medals have received the King's gracious approval: the Copley medal to Prof. Dmitri Ivanovitch Mendeléef, of St. Petersburg, for his contributions to chemical and physical science; a Royal medal to Prof. John Henry Poynting, F.R.S., for his researches in physical science,

Digitized by Google

especially in connection with the constant of gravitation and the theories of electrodynamics and radiation; a Royal medal to Prof. Charles Scott Sherrington, F.R.S., for his researches on the central nervous system, especially in relation to reflex action; the Davy medal to Prof. Albert Ladenburg, of Breslau, for his researches in organic chemistry, especially in connection with the synthesis of natural alkaloids; the Hughes medal to Prof. Augusto Righi, of Bologna, on the ground of his experimental researches in electrical science.

Milan Exhibition.—In addition to the awards which we previously announced in connection with this exhibition, we are now officially informed that the executive committee have allotted £200 of the sum given by his Majesty the King of Italy as an international prize for the purpose of encouraging the study and practical testing of a simple appliance of small cost which shall serve to detect the existence of currents of high potential in electrical cables which have to be handled by workmen charged with the laying or repair of such cables. Applications for admission to the competition must reach the executive committee of the exhibition before Dec. 31, 1905, and must be accompanied by a registration fee of 16s, together with a description (in no less than two copies) of the invention, either in Italian or French. The chief technical conditions which the appliance has to satisfy are the following: (*a*) Must be easy to handle, conveniently portable, and not exceeding 7lb. (3 kg.) in weight. (*b*) Must reliably reveal clearly and safely differences of potential of not less than 300 volts. (*c*) Must not require special conditions of application, and must give indications easily readable and of a nature to avoid all uncertainty. (*d*) The cost of the appliance must be low, wherefore, other things being equal, the most economical will be preferred; it must be easy of repair, and so constructed that the breakdowns in working to which it may be subject as a whole or in any part shall be easily detected and noticed, and such as not to give rise to any dangerous uncertainty. (*e*) Shall not be liable to easily get out of order or out of repair, even when subjected to very great differences of potential, or through atmospheric influences, shocks, abnormal position, etc. (*f*) The method of mounting the parts subjected to wear and tear and exchange shall be such as to disclose in some clear fashion any getting out of order which may be dangerous. The prize will be assigned by a jury composed of five members, who can also award one or more honourable mentions, without monetary prize, to those among the other competitors whom they shall deem worthy. This offer should do much to stimulate the study of that special subject.

Manchester Local Section.—The opening meeting of the Manchester Section of the Institution of Electrical Engineers will be held at the Grand Hotel, Manchester, on Friday, Nov. 17, at 7.30 p.m., when the chairman, Mr. S. L. Pearce, will give his address. The following programme of meetings has been arranged for the session: Nov. 28, Dr. W. G. Rhodes, M.I.E.E., "Theoretical Considerations of Feeder Systems"; S. J. Watson, M.I.E.E., "Street Cable Systems"; Dec. 12, Haydn Harrison, M.I.E.E, "Street-Lighting"; Jan. 16, W. C Mountain, M.I.E.E., "Electric Winding as applied to Main Shafts, considered Practically and Commercially"; Jan. 30, James Atkinson, M.I.M.E., "Gas-Engines applied to Electric Driving"; Feb. 13, M. B Field, M I E E, "Idle Currents"; Feb. 27, T. H. Schoepf, M I.E E, "Single-Phase Railway Working"; March 2, annual dinner; March 12, J. R. Salter, M.I.E.E, "Economic Considerations in the Employment of Storage Batteries"; March 27, L. J. Hunt, A.M.I.E.E., "Alternating-Current Motors"; April 10, general meeting, H. C. Crews, M.I.E.E, "Lifts and Hoists." In connection with the students' section meetings and visits have been arranged as under: Nov. 24, address by James Swinburne, M.I.E.E.; Dec. 8, W. H. M. Parr, "The Electrification of Existing Steam Railways"; Dec. 22, J. C. Ward, "The Electrical Equipment of Automobiles'; Jan. 12, W. T. Massey, "The Manufacture of Electric Cables"; Jan. 26, F. Shaw, "Electric Lamps"; Feb. 9, H. A. Carney, "Electrical Instruments"; Feb 23, annual dinner; March 9, E. Müller and J. Davies, "Modern Primary Batteries"; March 23, R. C C. Yates, "Lubrication and Lubricants"; March 23, W. Browning, "Notes on Electrical Conductivity"; April 6, general meeting at 7 p.m., D. L. Sands, "The Selenium Photometer. Visits—By the kind permission of the undermentioned firms visits have been arranged as follows: Dec 2, the works of Messrs. Dick, Kerr, and Co, Limited, Preston; Dec. 16, the Stuart-street generating station of the Manchester Corporation; Jan. 6, the works of the Chloride Electrical Storage Company, Limited, Clifton Junction; Jan. 20, the works of the British Insulated and Helsby Cables, Limited, Helsby, near Warrington; Feb. 3, the works of the National Gas-Engine Company, Ashton-under-Lyne; Feb. 17, the works of Messrs. Hick, Hargreaves, and Co., Limited, Bolton; Feb. 17, the works of Messrs. John Musgrave and Sons, Limited, Bolton; March 3, the works of Messrs. Ferranti, Limited, Hollinwood; March 17, the Liverpool and Southport Electric Railway.

Ventilation of the Law Courts.—The problem which faces the engineer in his endeavour to equip large public buildings with a perfect scheme of ventilation is not a simple one, and in the case of the Law Courts, where each chamber is presided over by a judge whose views as to temperature and ventilation are sometimes distinct from those of his brother in the adjoining chamber, the problem is by no means simplified. It is not surprising, therefore, to read the strictures recently made by one of his Majesty's judges on the imperfect ventilation of his court. The *Lancet* also comments upon the matter from the hygienic standpoint, and gives a few facts as to the provision for ventilation made in the Royal Courts of Justice. In the crypt beneath the corridors of the courts are located the steam engines and boilers which work the dynamos for generating the electric power to drive the 21 fans used for extracting the vitiated air, and for forcing the fresh air to the several courts. The supply of air can either be heated or cooled before delivery. For the former purpose there are two calorifiers, in which the circulating coils are heated by the exhaust steam from the engines; the hot water in the coils then circulates through the various radiators throughout the buildings. In addition to the circulation of the water by gravity, there are two powerful steam-driven force pumps connected to this hot-water circulating system that accelerate the flow of water through the radiators. The mechanism by means of which the fresh air is heated in its passage to the Tobin's ventilators fixed in the court consists of a separate vacuum engine for extracting the moisture from the steam as it leaves the exhaust in its passage to the calorifiers. The air before delivery into the Tobin's tubes is washed in a spray and filtered or cooled. For the purpose of cooling the air in very hot weather, there is a complete freezing plant which keeps the water at a temperature of 40deg. F. The dynamos that drive the fans yield a pressure of 110 volts 650 amperes, the current required when all the fans are in operation being 350 amperes There is also working in connection with the dynamos a booster for charging the 60 accumulators stored in a separate building, each of which weigh 15cwt. These accumulators also form a reserve for supplying the

Digitized by Google

electric light in the event of any failure of current from the mains. Two chambers are devoted to the control of the electrical apparatus, one for lighting and the other for regulating the current to the several fans and machinery in connection with them. The switchboards are of white marble, and are also fixed in these chambers.

Junior Institution of Engineers.—The annual general meeting of this institution, which took place last week, the retiring chairman, Mr. S Cutler, jun., M.I.Mech.E., presiding, was also the first general meeting of the society after its constitution as an incorporated body, and was held under the requirements of the articles of association. The annual report of the council showed an increase in membership of 888. There were 32 visits to works during the year, and 11 meetings had been held to the celebration of the "coming of age" of the institution. The election of officers resulted as follows: chairman—Mr. Adam Hunter, A.M.I.C.E; vice-chairmen—Messrs. Lewis H Rugg, A.M.I.C.E, and F. S. Pilling, M.I.M.E.; members of council—Messrs. G. T. Bullock, F. R Durham, A.M.I.C.E., G H. Hughes, M.I.M.E., and A. G. Young; provincial members of council—North of England, A. E. Rasey, A.M.I.M.E; Midlands, E. King, A.M.I.M.E; Eastern Counties, J. Julian; Southern Counties, F. S. Miller; West of England, E. W. Porter, A.M.I.C.E; Scottish District, G. E. Jackson; Irish, W. E. Lilly, M.I.M.E.; Welsh, H. F. Hunt, B.Sc. On Nov. 3 the inaugural meeting of the twenty-fifth session took place. The chair was taken by Sir William H. White, K.C.B., F.R.S, past-president, in the absence of Mr. W. H. Lindley (the president). The institution medal for the most meritorious paper of the previous session was presented to Mr. George H Hughes for his contribution entitled "Practical Notes on Waterworks Construction." A very cordial vote of thanks having been passed to Mr. Lindley for his services to the institution during the past year, Sir William White then inducted to the chair the new president, Mr. Dugald Clerk, M.I.C.E., investing him with the badge. Mr. Clerk took as the subject of his presidential address "The Problem of the Gas-Turbine," an account of which appears elsewhere in our issue. The address was followed with the closest interest throughout, and at its conclusion a hearty vote of thanks was accorded the president. Sir William White was also thanked for undertaking the duties of acting president. It was announced that a visit would be paid to Messrs. Barclay, Perkins, and Co.'s brewery at Southwark on Saturday afternoon, Nov. 18, and a meeting would be held on Dec. 8, when a paper on "Electric Mains for Power Transmission Work" would be read by Prof John T. Morris, M.I.E.E (member). The other meetings, etc., of the new session have been arranged as follows, and visits to various works will take place, of which due notice will be given: Jan. 26, "Some Notes on Boiler Trials," by Prof. J. D. Cormack, B.Sc. (hon. member); Feb. 2, "Some Recent Electrical Engineering Measuring Instruments," by Mr. Kenelm Edgcumbe, M.I.M.E. (member); Feb. 10, anniversary dinner in the Victoria Hall of the Hotel Cecil, the president in the chair; Feb. 15, "Architectural Design and Expression," by Mr. H. Heathcote Statham; March 2, "Gas-Engine Indicators," by Mr. L. F. de Peyrecave, Stud.I.C.E (member); March 10, conversazione—a lecturette on "The Evolution of the Man-of-War," illustrated by lantern slides kindly lent by the Navy League, will be given during the evening by Mr. C. Alfred Smith, B.Sc. (member); April 11, joint meeting with the discussion section of the Architectural Association at 18, Tufton-street, Westminster (near the Church House and Westminster Abbey), commencing at 7.30 p.m., paper on "Ferro-Concrete," by S. M. Bylander, M.J.I.E; April 20, "The Internal-Combustion Engine as applied to Marine Purposes," by Mr. Francis J. Maddox, Stud.Inst.C.E. (member); May 11, "The Structural Design of Factories," by Mr. Adam Hunter, A.M.I.C.E. (chairman).

Signal Wires.—The committee appointed to inquire into the question of rubber-covered wire for railway signal installation presented their report to the recent convention of the Railway Signal Association, Niagara Falls, N.Y. The object of the inquiry was to obtain a proper insulated signal wire, and data were gathered principally from the results of researches and experiments carried on by the Government and some of the telegraph and telephone companies. No definite specifications were put forward by the committee for adoption, and the investigations are in a sense yet incomplete. However, some of the requirements and tests which are contained in the report may be of interest. Conductors must be soft-drawn, annealed copper wire having a conductivity of not less than 98 per cent. of that of pure copper. Each wire forming a conductor must be continuous, without splice, must be uniform in cross-sections, free from flaws, scales, or other imperfections, and provided with a heavy uniform coating of tin. Each solid conductor must stand an elongation of 25 per cent. of its length in 10in. before breaking. In torsion it must stand before breaking 30 twists in 6in. Samples of the wire must be thoroughly cleaned with alcohol and immersed in hydrochloric acid of specific gravity 1·088 for one minute. They must then be rinsed in clear water and immersed in a sodium sulphide solution of specific gravity 1·142 for 30 seconds and again washed. This operation must be gone through four times before the wire becomes clearly blackened. The vulcanised rubber compound must consist of not less than 30 per cent. of the best grade of fine Para gum mixed with sulphur and dry inorganic mineral matter only. The insulation must be tough, elastic, adhering strongly to the wire, homogeneous in character, and must be placed concentrically about the conductor. The rubber insulation must be subjected for one hour to a temperature of 260deg. F., using dry heat, and at the expiration of that time must be tested for elasticity, elongation, and permanent set. The circular mils cross-section, the thickness of the rubber insulation (measured at the thinnest point), the minimum resistance in megohms per mile, and the dielectric strength for the various sizes of wire shall conform to the following table:

Size. B. & S. gauge.	Area in circular mils.	Thickness of insulation.	Insulation resistance. Megohms per mile.	Test voltage. Alternating current.
0	105,592	$\frac{1}{8}$in. wall or $\frac{1}{32}$ O.D.	800	8,000
1	83 694	$\frac{1}{4}$in. ,, $\frac{1}{32}$,,	800	8,000
2	66.373	$\frac{1}{4}$in. ,, $\frac{1}{32}$,,	800	8 000
4	41.742	$\frac{3}{32}$in. ,, $\frac{1}{32}$,,	800	5 000
6	26,250	$\frac{3}{32}$in. ,, $\frac{1}{32}$,,	900	5 000
8	16,509	$\frac{3}{32}$in. ,, $\frac{1}{32}$,,	900	5 000
9	13,090	$\frac{5}{64}$in. ,, $\frac{5}{32}$,,	900	4 000
10	10.380	$\frac{5}{64}$in. ,, $\frac{5}{32}$,,	900	4 000
12	6.530	$\frac{5}{64}$in. ,, $\frac{5}{32}$,,	1,200	4,000
14	4 107	$\frac{5}{64}$in. ,, $\frac{5}{32}$,,	1,500	4 000
16	2 583	$\frac{1}{16}$in. ,, $\frac{5}{32}$,,	1.500	3,000
18	1,624	$\frac{1}{16}$in. ,, $\frac{5}{32}$,,	1,500	3,000

The test for insulation must be made upon all wire without braiding, and after 48 hours' immersion in water at a temperature of from 65deg. to 75deg. F. Tests must be made with well-insulated battery and galvanometer with not less than 150 volts, and reading must be taken after one minute's electrification. The test voltage must be applied to the completed length of wire after the insulation test for a period of five minutes, using alternating current from a generator and transformer of ample capacity. The committee hope that at some future date complete specifications will be presented.

PROF. GISBERT KAPP.

Welcome Back to England.

On Friday last a number of prominent engineers entertained Prof. Gisbert Kapp in order to welcome him back to this country. The dinner, which was held in London, was presided over by Colonel Crompton, and amongst those present were Sir J. W. Swan, Sir Alexander B. W. Kennedy, Mr. Alexander Siemens, Profs. Unwin, Ayrton, and Silvanus P. Thompson, Mr. W. M. Mordey, Mr. J. Swinburne, and a number of other leading engineers.

Colonel CROMPTON proposed the only toast of the evening, welcoming Prof. Kapp back, and wishing him every success at the Birmingham University.

Prof. S. P. THOMPSON seconded, and congratulated Birmingham on its new professor. The university were to be commended for their procedure when filling the chair of electrical engineering. Instead of advertising the post at the lowest possible remuneration, they had looked round for the best man available and intimated to him that they would like him to apply. They could not have secured a man of wider experience, as Prof. Kapp added a full knowledge of German and Continental practice to his previous experience in England. He hoped that the work at Birmingham would further the electrical engineering industry, and that Prof. Kapp would remain for a long time with us.

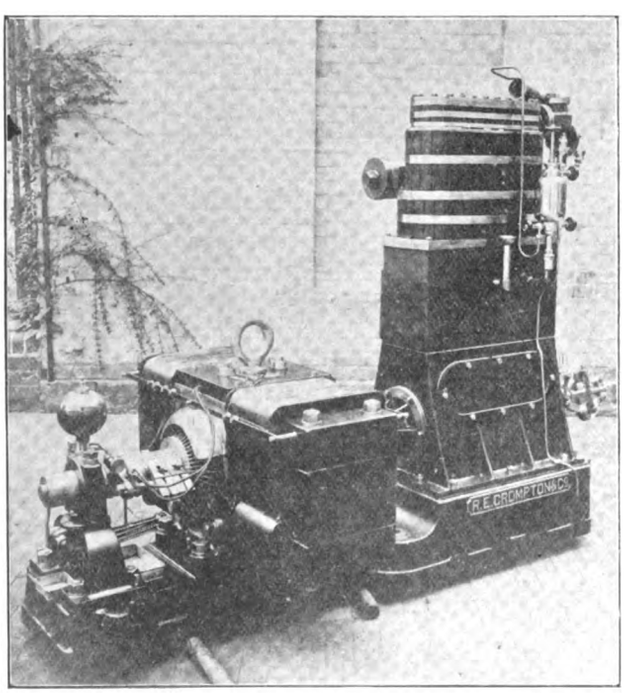
Other speeches were made giving reminiscences of the pioneering work in which Prof. Kapp had taken part. Mr. JAMES SWINBURNE gave amusing anecdotes of what he found at the Crompton works at Chelmsford when he succeeded Prof. Kapp as designer. One dynamo designed first by Mr. Crompton with no iron in the armature, and afterwards by Prof. Kapp with a cast-iron core, was now serving the useful function of an earth-plate for earthing the middle wire of the lighting system. Mr. RAWORTH recalled an unsuccessful application made to the Edison Swan Company, or its predecessor, for a position. Prof. Kapp, who was then just leaving college, offered to take any position without salary. Disappointed here, he found employment with Messrs. Gwynne and Co., designing centrifugal pumps, and Mr. W. H. ALLEN, who was then the manager of Gwynne's, recalled these facts.

Prof. KAPP, in thanking all present for their good wishes, described the difficulty he had in obtaining a start in electrical work. When the company-promoting boom was on in 1882, millions of capital were subscribed for electrical undertakings. None of the companies, however, were prepared to pay salaries to men with brains. At last he met Colonel Crompton, who offered him a position of works manager. To his statement that he had not sufficient knowledge of electrical design, Colonel Crompton replied that he would teach him. The time spent at Chelmsford had been most pleasant, and he appreciated having his old employer in the chair that night. He wished to teach at Birmingham the best English practice, and he trusted that all present would assist him by freely giving any information he might require for his students. What success he had had as an instructor in Germany was due to the freely given information which German manufacturers had placed at his disposal.

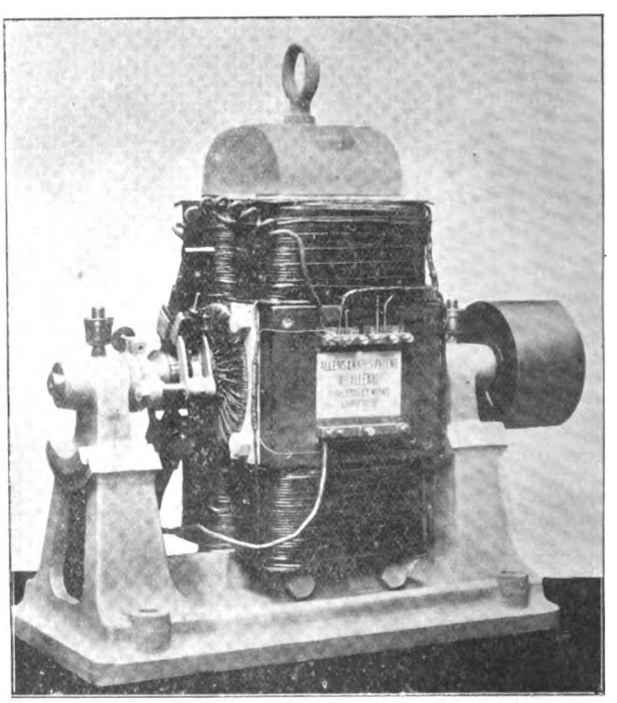
A few more informal speeches terminated a most enjoyable evening.

As a memento of the dinner, the signatures of all Prof. Kapp's hosts were obtained on the back of the menu cards, which were handed to him. These cards and signatures we reproduce herewith, together with a portrait of Prof. Kapp. Through the courtesy of Messrs. Crompton and Co., Messrs. W. H. Allen and Co., and Messrs. Johnson and Phillips, we have been able to surround these with illustrations of historic work carried out under the supervision of Prof. Kapp in the early pioneering day of electric lighting. It was with Crompton's that he had his first experience in the design and manufacture of electrical machinery. With Colonel Crompton he did a great deal of original investigations into dynamo design, which were freely placed by him at the disposal of electrical engineers. The result was that in the eighties practically every designer of dynamo machines relied for their data on his books or on papers communicated by him to various engineering societies. We do not wish in any way to depreciate the work done by other pioneers, but Prof. Kapp's lucid descriptions of his methods of design made his work more valuable to the general engineer.

The illustrations surrounding his photograph on p. 654 of this issue show progressive steps in the design of direct-current dynamos. The Tilbury Dock plant, installed in 1885, consisted of a large number of small units, the machines being of the vertical two-pole double magnetic circuit type. The switchboard used to control these machines, which were, we believe, used solely for arc lighting, would not pass the requirements of a fire insurance company now, but it successfully served its object for many years. The Allen-Kapp dynamo of 1887 shows an inverted Hopkinson type which for many years held the favour of most manufacturers in this country. It was a drum machine, and had the Kapp patent end connections. The end view of an early Crompton-Kapp drum armature is shown



A Crompton-Willans Searchlight Set supplied April, 1885, to H.M.S. Curlew.



The Allen-Kapp Dynamo made from the designs illustrated on previous page.

below. At the bottom of the page we reproduce a view of the Amberley-road station, in which Kapp's alternators were employed driven by Hornsby engines. These machines had a ring core armature and two sets of field-magnets, one on either side of the same. Although installed

The Birmingham University.

in 1890, they are still used by the Metropolitan Electric Supply Company. One of the resident engineers in charge of the station, which has become renowned for the multiplicity of types of plant it contains, told us that the Kapp alternators never failed him on emergencies. The remaining block is of a Kapp multipolar dynamo, one of a large number installed in 1891 in the St. Pancras station by Messrs. Johnson and Phillips. These machines may be looked upon as the pioneers of the multipolar type in this country. That they had faults, no one will deny, but they were the first of a type which now holds the market in every country, even for small sizes, where the two-pole machine was supposed to be invincible. Some of the St. Pancras machines have now been displaced by larger units occupying less floor space for a given output. The others are still at work, and have for the last 13 years supplied electricity to the St. Pancras mains. Thus both the alternating and direct current central-station plants supplied by Messrs. Johnson and Phillips in 1890 to Prof. Kapp's designs have withstood all demands upon them. On p. 655 we reproduce, through the courtesy of Messrs. W. H. Allen and Co., an original drawing, with Prof. Kapp's own handwriting on it, dated 1885. It will be seen from this that he was introducing then mechanical means for directly driving the armature bars, which on smooth-cored armatures was absolutely necessary. On the same page will be found a distributing switchboard supplied by Messrs. Crompton and Co. in 1885 to the Vienna Gas Company for their electric lighting undertaking. Our concluding block is of the Birmingham University, where Prof. Kapp's new work is to be undertaken. His past experience practically assures one that he will make his department a thorough success, as he will secure the co-operation of all the prominent electrical engineers of the country. His tact and business capacity will also induce the active support of both the university senate and of his staff.

ELECTRIC LIGHTING LOANS AND LOCAL GOVERNMENT BOARD INQUIRIES RESPECTING THE SAME.

In our last week's issue we dealt in our leading article with the connection between the Local Government Board and electrical undertakings. Elsewhere in the same issue there appeared a considerable portion of the evidence given at the inquiry at Torquay respecting a proposed loan of £9,500 for more plant and for the reorganisation of the existing generating station. We propose this week to go more fully into the subject with reference to the action of the Board in Torquay and other places. The following is a *résumé* of the powers which Parliament has vested in the Local Government Board, also of some instances in which we think these powers are being exceeded. This last portion of the subject is divided under two heads, showing respectively what we think to be essential errors in the general policy of the Board and errors as to technical details on the part of their inspectors.

With respect to the power of local authorities to borrow money, the Electric Lighting Act of 1882 provides, under Clause 8, that:

(8) A local authority authorised to supply electricity by any license, order, or special Act may from time to time borrow money on such security, with such consent and subject to such provisions and restrictions with respect to borrowing and the repayment of loans as are in the schedule to this Act in that behalf mentioned, and the money so borrowed shall be deemed to be borrowed under the enactments subject to the provisions and restrictions of which it is borrowed, and the accounts of all receipts and expenditure by the local authority in pursuance of this Act, or any license, order, or special Act, shall be subject to such audit as is in the said schedule in that behalf mentioned: provided always, that any moneys borrowed under this section by the local authority of any district to which the Local Loans Act, 1875, extends, may, if it is thought fit, be borrowed in manner provided by that Act; and in the construction of the said Act for the purposes of this Act the expression "prescribed" means prescribed by any conditions imposed by the authority whose consent is required to borrowing under this section. Where any local authority is authorised by any Act to raise any money which they may be empowered to borrow for certain purposes by the issue of corporation or other stock any money which a local authority may be authorised to borrow under this section may, if it is thought fit, be raised by them by the issue of such stock as aforesaid. This section shall not apply to the mayor, commonalty, and citizens of the city of London or to the Metropolitan Board of Works, except in so far as the Metropolitan Board of Works may be concerned in the borrowing of any money by any vestry or district board.

Under the schedule at the end of this Act the local authorities controlling urban sanitary districts or rural sanitary districts can only raise money upon the security of the local rates with the consent of the Local Government Board, and subject to the provisions and restrictions as to the borrowing and repayment of loans contained in Sections 233, 234, and 236 to 239 (both inclusive) of the Public Health Act of 1875. The first of these clauses requires the sanction of the Local Government Board for all loans. The second (No. 234) provides that money shall not be borrowed except for permanent works, and that the whole sum raised for all purposes in any one district shall not at any time exceed "the assessable value for two years of the premises assessable within the district in respect of which such money may be borrowed." Sub-clause 3 of this section reads:

Where the sum proposed to be borrowed with such balances (if any) would exceed the assessable value for one year of such premises, the Local Government Board shall not give their sanction to such loan until one of their inspectors has held a local inquiry and reported to the said Board.

The rest of the clauses of the section deal with the repayment of loans. Clauses 236 to 239 deal with mortgages authorised under the Act, and with the appointment of a receiver should the interest and sinking fund not be paid within six months of the date due. Under Part 9 of the Act there are four clauses as to Local Government Board inquiries, which read as follows:

293. *Power of Board to Direct Inquiries.*—The Local Government Board may from time to time cause to be made such inquiries as are directed by this Act, and such inquiries as they

Digitized by Google

see fit in relation to any matters concerning the public health in any place, or any matters with respect to which their sanction, approval, or consent is required by this Act.

294. *Orders as to Costs of Inquiries.*—The Local Government Board may make orders as to the costs of inquiries or proceedings instituted by, or of appeals to the said Board under this Act, and as to the parties by whom or the rates out of which such costs shall be borne; and every such order may be made a rule of one of the superior courts of law on the application of any person named therein.

295. *Orders of Board under this Act.*—All orders made by the Local Government Board in pursuance of this Act shall be binding and conclusive in respect of the matters to which they refer, and shall be published in such manner as that Board may direct.

296. *Powers of Inspector of Local Government Board.*—Inspectors of the Local Government Board shall, for the purposes of any inquiry directed by the Board, have in relation to witnesses and their examination, the production of papers and accounts, and the inspection of places and matters required to be inspected, similar powers to those which poor-law inspectors have under the Acts relating to the relief of the poor for the purposes of those Acts.

It should be borne in mind when considering these clauses, that the major portion of the Public Health Act of 1875 deals with sanitary work and local improvements which have to be carried out by local authorities, and which are not directly remunerative. The Board of Trade are responsible for the granting of electric lighting provisional orders, and the fact that such orders are granted may be taken to be evidence that a supply is needed in the district in question, which supply the Board of Trade think the local authority should provide. The system of supply has also to be approved by the Board of Trade, and the accounts, methods of charging, etc., come under the regulations of the same authority. It would seem, therefore, that the field of the Local Government Board was limited to the granting of loans, subject to proof that capital and revenue charges are properly separated, and that the loans in question do not exhaust the borrowing powers of the local authority, or take money which may be required for sanitary or other more necessary work which cannot be carried out by private enterprise.

GENERAL POLICY AS TO ELECTRIC LIGHTING LOANS.

The Local Government Board do not issue a statement as to their general policy for refusing or granting loans, but the same can be fairly well gauged from the statement of inspectors at local inquiries and from the reports issued as a result of these inquiries. From these it is evident that the present policy of the Board is to check municipal expenditure, which, without doubt, has been rashly undertaken in certain instances. The effort is a good one, but the method adopted is sometimes disastrous, and may defeat the express wishes of a local authority to carry out its parliamentary obligations. The policy has also led the Board to make suggestions as to alternative courses to the granting of loans, which, if adopted, would be wrong both technically and from a commercial standpoint. A third effect of the attempt to decrease expenditure is that, when holding inquiries as to the reasons for granting or withholding a certain loan, the inspectors have gone outside the scope of the inquiry to consider the financial success or otherwise of departments of the local authorities which have nothing to do with the loan in question.

The following brief *résumé* of special cases may serve to bear out at least a considerable portion of the general charges made above. Where small-type extracts are given they are taken from reports from the local papers of the proceedings at the inquiry, as to the exact accuracy of which we are not responsible.

Torquay.—On pp. 634 and 635 of our last issue will be found a fairly full report of the second Local Government Board inquiry respecting extensions of the Torquay electric lighting station. We are now able to give the charges which the Dolter Company will pay for the energy the Corporation have agreed to supply to them. For the first 100,000 units 2d. per unit will be charged, for the next 50,000 units 1¾d., and all in excess of this the price would be 1½d. per unit. It will be remembered that the inspector expressed a strong opinion that these terms were not favourable to the Corporation. Few supply engineers will agree with this. We would also especially refer our readers to the report in our last issue, in which the inspector practically censured the Corporation for not fully considering "the other proposals of the Dolter Company, as to taking over the whole of the electricity undertaking and working it on a profit-sharing basis." Surely the final conclusion from this suggestion is that the Dolter Company would only make such an offer if they were assured that the whole undertaking would be profitable to them when duly extended.

Rochdale.—In January this year an inquiry was held at Rochdale to consider the application of the Corporation to borrow £42,405 for the purpose of extending the electricity works to meet the growing demand for current for lighting and for the supply of the tramways. There was no opposition to the application from the ratepayers, but the inquiry lasted 3¾ hours. The details of the loan asked for were as follows:

Extension of building	£4,500
Two 412-kw. steam dynamos for direct-current supply	5,200
Three 200-kw. steam alternators for three-phase high-tension supply	4,500
One 200-kw. motor-alternator	800
Three Lancashire boilers	3,150
Five superheaters, with fittings, pipe connections, etc.	2,750
Two jet condensers, surface condenser, etc.	2,650
Additional feed pump, feed piping, tanks, valves, and accessories	500
High-tension switchboards' extensions and alterations to low-tension switchboards for new sets, cable connections, etc.	2,950
Motor-generators, transformers, switchgear, etc., for sub-station	1,550
Meters, services, cables, conduits, etc., for distribution	10,000
	38,350
Fees and contingencies 10 per cent.	3,855
Total	£42,405

The Town Clerk explained that:

The additional expenditure now proposed was rendered necessary by reason of the extension of the tramways and the increased private supplies. It was anticipated that during the year 1905-6 there would be required for tramway purposes 600 kw. capacity and for lighting 500 kw. capacity. At the end of December last there were 214 private consumers of current. For the 12 months ended March, 1904, the private light consumed was 193,751 units, 255,350 units were sold for private power, and 392,237 units went out for electric tram traction, making a total of 841,338 units sold, against 423,389 in the previous year. At present 29 tramcars were running, and 21 more were expected shortly, so that the current required for tramway traction would be increased considerably. Up to August of last year only about 4½ miles of tramway was being operated; now the length of route on which cars were running was over 13 miles, and when the Littleborough and Heywood sections were completed there would be about 19 miles of route being worked. For the year ended March 31 last the receipts at the electricity works amounted to £7,542. 2s. 10d., and the expenditure £6,919. 9s. 3d. (of which £3,847 was interest and sinking fund payments), leaving a balance to the good of £622. 13s. 7d., against a loss of £1,492. 1s. 10d. in the year before.

The following dispute then took place between the inspector and the borough treasurer, Mr. F. Boothman:

The Inspector remarked that the department was not making a profit on the current used for lighting. Really there was a loss on the working of the department.

Mr. Boothman: Excluding, of course, the income from tramways.

The Inspector: If the trams are not making a profit, you cannot put the revenue they pay to the profit of another department.

Mr. Boothman: It is not printed as profit. It is a sale just as it would be to any private company.

The Inspector: Quite so, but taking the two together the result is a direct loss. You cannot take the work of one department and charge it to another and say, "I am making a profit." You are not.

Mr. Boothman was not able to follow that argument. The works showed a surplus of £622.

The Inspector said one undertaking could not make a profit at the expense of the other.

Mr. Boothman agreed that taking the departments as one undertaking there was a deficit.

The Inspector: They must be taken as one undertaking.

Mr. Boothman: We are bound to take them separately as a trading undertaking.

Digitized by Google

The Inspector: That is merely a question of keeping accounts. The £622 which you say is profit is dependent on the revenue from the tramway account, which shows a very large deficit.

The Town Clerk pointed out that the deficit on the tramways was due to the period being one of reconstruction, when there were no receipts to set against the capital expenditure.

The engineer, Mr. Atchison, gave similar evidence that they sold electricity to the tramway department, and, of course, charged a reasonable and profitable price for the same, but the inspector replied that he was charging this to an insolvent department. With respect to deficits made in previous years, the town clerk explained that these had been met out of the rates. Thus:

In the accounts for the year ending March, 1901 (not a complete year's working), there was a loss on the year's operations of £1,666; the next year to March, 1902, the loss was £2,385, the third year it was £1,492, and last year there was a surplus of £622.

The Inspector: You have practically lost £5,000 on the undertaking.

The Town Clerk: We suggest that the repayment of capital is not a loss. I don't want you to lose sight of the fact that the sale of current for lighting has increased from 141,735 units to 193,000, and for private power consumption from 65,000 units to 255,000.

In reply to a question as to how long the proposed new plant would meet the demand, Mr. Atchison replied about two or three years. A good portion of the remaining time at the inquiry was spent in an investigation of the accounts of the tramway department, which it was shown were in the transition stage from horse to electric traction.

It is our contention that this inquiry into the tramway undertaking and its profits or losses was *ultra vires*. The question as to whether the electric lighting department were or were not supplying the tramway department at a loss would be a legitimate issue. Under the powers and obligations conferred on the Rochdale Corporation by its provisional order it was bound to supply the tramway undertaking with current. At this inquiry the question was also raised as to why the Corporation had not entered into negotiations with the Lancashire Power Company for the supply of the tramways with electrical energy. We believe we are correct in stating that, although the loan with certain reductions was ultimately granted, the matter was in suspense for some nine or ten months. We are indebted to the *Rochdale Observer* for the above report.

Wood Green.—The case of Wood Green was dealt with more or less fully in our issue for Sept. 16, 1904. In this issue we published the full text of the Local Government Board's decision in refusing a loan for electric lighting purposes. For the sake of easy reference we reproduce this decision here:

"I am directed by the Local Government Board to state that they have had under consideration the report made by their inspector, Mr. Hooper, after the inquiry held by him with reference to the application of the Urban District Council of Wood Green for sanction to borrow £43,200, since increased to £43,570. The Board have very carefully considered all information placed before them by the District Council, and it appears to them upon that information to be extremely doubtful whether the scheme, if carried out, would be likely to prove a financial success. The evidence given as to the probable demand for current was of an unsatisfactory character, for it was first stated that the demand was estimated to be equivalent to 330 consumers at 60 8-c.p. lamps per house, but when it was pointed out and admitted by the engineer that the number of lamps estimated for was far too high considering the class of property to be supplied, the estimate of the demand was altered to 660 consumers at 30 8-c.p. lamps per house. It does not clearly appear in what manner either estimate has been arrived at. The Board consider that the District Council before undertaking a scheme of the magnitude proposed should obtain more reliable information as to the extent to which the electric light is likely to be taken up. Moreover, the Board are by no means convinced by the evidence submitted to them that the District Council are acting prudently and in the best interests of their district in proposing to erect a generating station for the supply of electricity, and they think that the whole question, including the methods of supply, should be reconsidered by the District Council."

The net result of this decision is that there is no electric light or power to be obtained in Wood Green. The local Council have so far refused to be driven into the hands of the North Metropolitan Electric Power Distribution Company, and they have not again approached the Local Government Board for a loan to enable them to do what Parliament has approved their doing in a way which the Board of Trade have sanctioned.

Technical Details.

We now propose to refer to two instances where the Local Government Board inspectors have adversely criticised the technical details of proposed schemes, and in which the expert opinions of the inspector are either directly in opposition to approved practice, or at least open to that doubt which frequently exists between expert opinions by different gentlemen. This point we have dealt with more fully in our leader, but the question of an economic supply from a power company for lighting purposes only is very questionable. The power factor of the lighting load is extremely low, and this results in the capital charges for the high-tension transmission system averaging out to a high figure per unit. It is yet to be proved that for lighting only the bulk supply is profitable unless the transmission mains can be also utilised for power distribution, which may then bear the bulk of the capital charges. As an example of this, the North Metropolitan Electric Power Distribution Company entered into an agreement with the St. Albans Corporation some years ago for the taking over of the electric lighting order. The company never proposed to supply St. Albans from its large power station at Willesden, but would have put down a separate plant for St. Albans in the same way that the town would have done. As a matter of fact, we believe that neither the town nor the company have done anything but make agreements and consider reports as to the supply of St. Albans with electricity.

In the first inquiry held at Torquay, when a completely new station was proposed, the following evidence was given as reported in the *Torquay Directory*:

The Inspector asked why it was proposed to instal two different sets of boilers—cylindrical and water-tube?

Councillor Ball stated that the object was to effect a saving in the coal bill.

The Inspector did not think that the saving would be appreciable in practice when regard was paid to other considerations. For instance, the boilers would require to be stoked differently, "and you know," said he, "that much money is frequently wasted in stoking." Uniform boilers, which could be stoked without men undergoing special instruction, would be desirable.

We think it a great pity that Councillor Ball answered this query instead of Mr. P. Storey, the electrical engineer of the town. The query shows a curious lack of knowledge on the part of the inspector of the requirements from an electric lighting boiler-house. We think the bulk of engineers working such stations are now unanimously of opinion that it is most economical to have Lancashire boilers to meet the general demand for steam during, say, 20 hours per day. The quick-steaming properties of the water-tube boilers make them most suitable for supplying the extra steam needed during the lighting peaks. The large water capacity of the Lancashire boilers makes them most valuable for dealing with a sudden fog until such time as the water-tube boilers can have their steam raised. As regards the inspector's fear as to inefficient stoking due to having two types of boilers, Mr. Storey and most other station engineers would deal with the inefficient stoker quite as summarily as the Local Government Board did with the first Torquay application.

We have other reports before us as to the inquiries at Oldham, Norwich, Salford, and elsewhere, from which extracts of interest could be given, but they would only duplicate the general sense of the above.

THE DISTRIBUTION OF ELECTRICITY IN MINES.

BY B. C. H. J.

(Concluded from page 625.)

Gas barrel and other descriptions of metallic piping are used in the workings, principally in connection with lighting cables, as these are smaller than those used for power. In a mine which has permanent wallings these pipes act very well in giving a solid, mechanical protection

Digitized by Google

to the cables. Where falls are usual, however, such piping gets strained, bent, and twisted so badly that the cables inside are spoilt, and, moreover, there is extreme difficulty in extracting them. This is the case with screwed pipes; but where split barrel and open joint piping is used and the length is not so mechanically solid, danger arises from the free ends of each length and the split longitudinal edges cutting into the cable when distorted by mechanical shocks.

A class of cable that is largely coming into use for coal-cutter trailing leads is one insulated by rubber, and protected by leather either in a form of strip braiding or as a tube with stitched sides. This is taking the place of the simple rubber-insulated, hemp-braided, or the bitumen-insulated and braided conductor, neither of which last long under the trying conditions to which they are subjected.

The question of joints in the workings is not so momentous as that of joints in the shafts, as the conditions of working are, on the whole, less hazardous. Nevertheless, the fewer there are of them the better, and special consideration should be given to each one, so that it may properly suit the local conditions. There are not the same facilities for making joints in mines as there are in electricity supply work. In many collieries fire cannot be used on account of the firedamp, and this means that the conductor joints may not be sweated solid, that ordinary joint-box compound cannot be used, and to this is added the difficulty of adequate supervision under the conditions of mining transit. The great thing is to employ a jointer who is a bit of an archangel as to conscientiousness, and is, further, expert and likewise used to mining conditions governing jointing. Such a treasure is not easily found in this world outside cable works.

As regards straight-through joints, rubber cables should have vulcanised joints made in the usual manner wherever possible. This method comprises wrapping the conductor with a pure rubber tape, then with vulcanising tapes, binding this solid with cotton tapes, and then immersing the joint in a compound of paraffin wax and sulphur (heated to an even temperature of 300deg. F.) for about an hour. There are three ways of applying the heat, as follows: (1) the old-fashioned colza oil lamp heated cure; (2) a fire-heated cast-iron cure; (3) an electrically-heated cure. The latter is most to be commended if it is possible to arrange for the supply current. It is safe, simple, and easily adjustable as to temperature, and therefore likely to give the best results in awkward situations. Where vulcanising is impossible, the joint should be thickly bound with the best rubber tape, over which is tightly lapped a strong weather-resisting tape, the whole completed joint being well varnished. It may be as well to mention that a slight strain put on pure rubber tape when binding it on is more satisfactory than the use of solution.

Joints in bitumen-insulated cables should be made with bitumen or guttaroid tape, evenly lapped around without strain, each layer being firmly smoothed and compressed by the jointer's hand, which must be dry and of natural heat the better to mould the layers together into one solid sleeve. This mould is covered by impregnated cotton tapes and varnished. If possible, the joint should be vulcanised similarly to a rubber joint (the time of immersion in the compound being only a minute or so) before finally taping up and varnishing for the better welding together of the bituminous taping.

In some cases iron joint-boxes are preferred, and these are generally used for paper-insulated, lead-covered cables. Whatever the class of cable, however, if it is composed of more than one conductor, such as a concentric or three core, boxes are usually the best method of connecting together the factory lengths, as the insulating material is then run into the box in a fluid state. This more effectively insulates one conductor from another, and seals the whole joint than taping ever can, the box acting as a mould and mechanical protection. The question then arises as to the kind of filling material. There are two: one is an insulating oil, and the other a bituminous compound. The requirements are high insulation, waterproofedness, adhesiveness, and solidity. Care should be taken that the compound used is not merely pitch or bitumen, as these are deficient in most of the qualities mentioned; the best compounds have a mixture of suitable oils to attain the qualities before mentioned. Further, the use of compound is a snare if it is poured in a half-baked state through the plug-hole of a joint-box, as it will not then fill the box properly, and the spaces left will attract moisture to the utter undoing of the cable. For this reason oil is sometimes used to fill the box with, but there is always a good chance, especially on a slope, that the oil will run down the interstices of the cable or out of the glands or faced surfaces of the box itself, leaving the interior of the box with a moisture attracting vacuum. With some box compounds, however, such as diatrine, the special mixture and low melting point prevents it cooling too much for the purpose, up to a period of two hours after heating; so that there would be ample time for conveying it from a safe part of the mine to the job in the special covered buckets supplied by the makers. The use of a petroleum residue for filling the boxes under such conditions has been considered, but there would appear to be nothing gained in the majority of cases, and the permanently semi-solid nature of the material might combine the faults of the oil and the compound respectively, merely to secure convenience in the jointing process.

To make quite sure that joint-boxes are properly filled up, it is recommended that the top is removable, as with disconnecting joint-boxes, instead of being merely fitted with plug holes for pouring purposes. All boxes should have the cable gripped under pressure, or the fittings positively anchored, so that there may be no chance of the box sliding along the joint and touching the terminals through rough usage or negligence. This possibility is to a great extent guarded against if the box glands are made to grip the cable tightly without using a loose bush, also if the box is filled solid with compound, the adhesiveness and solidity of which should prevent movement.

The conductor fittings, if not of the sweated type usual with public supply cable boxes, should have specially ample contact surfaces, while screw contacts on the inner conductor should be many and strong. At least four ¼in. grub screws per cable end should be allowed, and this means eight per straight joint. Here is where the archangel conscience comes in at an awkwardly situated, back-bending place, if supervision is absent, and the jointer can only count up to five. Lead sleeve joints are sometimes used with single or multicore cables, and these when properly made and protected are quite satisfactory. The unreliability of plumbing in awkward situations and the general lack of the conscience mentioned is, however, against the extensive use of this class of joint in mines.

Just a paragraph here to mention that, as in most mechanical work, joints are the weakest point of a cable network, and it is therefore necessary to pay special attention to this detail. Interested persons sometimes provide cable-jointing accessories which may be standard practice on electricity supply work above ground, but which are absolutely useless for the special conditions of mining work; and it is to save trouble on this point that the matter is now dealt with, in perhaps superfluous detail to many engineers.

Disconnecting boxes are sometimes used in place of switches for interrupting the supply of current at a branch, and these act equally as well if properly designed. An ideal pattern for such a box is one (1) in which the terminals are mechanically fixed thereto on solid insulating bases; (2) where the cable is gripped so as to be immobile to strains put upon it; (3) where the live parts are separated from one another by solid insulation that is fireproof and non-hygroscopic; (4) where the links or fuses are provided with insulating handles to prevent chance of shock when these are being operated upon; and (5) where the lid is so arranged that access is easy to an authorised person, and water cannot get inside when it is shut.

The switch and plug boxes used in connection with coal-cutters should be very simple, solid, and insulated to the verge of exagerated absurdness. The main item of design should be safety for the coal-cutter attendant, and strength. The switches fitted inside should only be capable of switching on current after the coal-cutter connection plug is affixed to the box. This prevents the chance of the machine

Digitized by Google

being started up when the attendant is away fixing the plug into the box. The mining regulations decree that metallic joint-boxes shall be earthed, and this is best done by screwing a brass set screw clamp on to the body of the box, to which is attached the earthing wire. On leadless or unarmoured cables the wire should be taken to the nearest earth, but on lead-covered cable it may be used to connect the box to the strand of wire that is used to connect the cable sheathings together, the lead or metallic covering being earthed itself at proper intervals.

As regards the official measurement of leakage, which affects cables as well as the underground machinery, it is generally conceded that Clauses 6 and 7 of the regulations cannot be literally fulfilled in practice, but apparatus is in use that at present sufficiently carries out the requirements of the situation. The clauses read as follows (the italics are the writer's): "(6) The insulation of every complete circuit, other than telephone or signal wires, used for the supply of energy, including all machinery, apparatus, or devices forming part of or in connection with such circuit, shall be so maintained that the leakage current, so far as is reasonably practicable, shall *not exceed one-thousandth of the maximum supply current, and suitable means shall be provided for the immediate localisation of leakage* (7) In every completely insulated circuit earth or fault detectors shall be kept connected up in every generating or transforming station, *to show immediately any defect in the insulation of the system.* The readings of these instruments shall be recorded daily in a book kept at the generating or transforming station or switch-house."

The fault detectors specified to show immediately any defect in the insulation is met by the use of a meter connected to the mains and to an earth-plate, no reading being shown when no leak exists. A leak upon either main will deflect the pointer in a distinctive direction, and by concentrating the instrument, as it were, upon that main by means of a switch the amount of leakage current is shown. This is not exact as to the comparative number number of amperes (as the amount of leakage from the other main or mains requires to be taken into account), but it is near enough for most purposes. Further, a fault of equal seriousness occurring on both mains would not be shown on the instrument when in its normal state of connection, but such a happening is hardly likely. As to the immediate localisation of leakage, this condition is best met by the provision of a portable testing set and plenty of disconnecting points in the circuit. Some engineers are under the impression that the instruments are required to write in chalk on a blackboard the exact locality of the fault to a yard within a few seconds of its happening, and this point of view is somewhat encouraged by the wording of the clause in question. The words "so far as is reasonably practicable" should not, however, be lost sight of in reference to this and many other of the regulations that may appear impracticable to the casual reader.

It should be noted that although this article has dealt with conditions obtaining under continuous-current practice in many of the items discussed, the same very frequently obtains for three-phase current work, except where it has been pointed out otherwise.

In conclusion, the writer would draw attention to a vital part of the subject by quoting another of the aptly-put truisms with which the 1904 report of the Home Office Committee abounds: "On one point, however, we observed that all witnesses were agreed—namely, that the apparatus should always be thoroughly well made and erected, and all the parts well protected from accident, and the dangerous parts from coming into contact with the workmen. Bad work, even in the first instance, does not save 20 per cent. of prime cost, and always ends in occasioning far more loss than the initial saving. In the record of accidents which have occurred the cause can almost always be traced to bad plant or arrangements. The reason of the unsatisfactory condition of the plant in many mines is, we think, to be found in the fact that electricity was introduced by instalments, and upon a small scale. This timidity has led in too many instances to insufficient power being supplied, and to the work being done in a temporary manner. But when once it has been introduced it has almost invariably proved so successful that its auxiliary and temporary character has passed away and it has become not only a permanent necessity, but a prime factor, with the consequence that the capacity of the plant as first introduced has been strained to the utmost, and has not infrequently broken down under these adverse conditions, and ultimately had to be replaced entirely by larger and more perfect appliances." *Verb sat. sap.*

THE PROBLEM OF THE GAS-TURBINE.*

BY DUGALD CLERK, M.I.C.E., PRESIDENT.

The wonderful success obtained by your distinguished past-president (the Hon. C. A. Parsons) and his many able followers with the steam-turbine in its various forms, has naturally attracted the attention of engineers to the apparently analogous problem of the internal-combustion turbine. Accordingly, much mathematical and engineering ability has been recently devoted to the subject—so far, I am sorry to say, without concrete result. In this subject, as yet, the dreams of the theorist obstinately decline to realise themselves in tangible iron and steel. I have not been able to find any gas-turbine in a state of effective rotation doing useful work, although I have noted many statements in the Press to the effect that some wonderful German, French, or Italian gas-turbine had worked, or was about to work, in such a manner as to relegate the ordinary cylinder and piston gas-engine to the museum with which many engineers used to threaten the steam-engine. One gas-turbine only has really rotated within my own direct knowledge. It was designed by Mr. F. W. Lanchester, of Birmingham, to operate with the exhaust gases from one of the petrol engines used in his well-known motorcars. He assured me a few days ago that it really rotated at a high speed, and made a loud shrieking noise, but only gave, he said, a total brake horse-power equal to that capable of being evolved by two blue-bottle flies. This power he did not consider to be satisfactory.

Speaking seriously, it does seem remarkable that so much interest should be taken by so many able men without any sort of result in practice. Why is this? I propose to-night to answer the question in so far as I can. It appears to me that most of those who have written on gas-turbines, and have even designed and patented them, have given too little weight to certain differences between the steam and internal-combustion engine problems. Many, indeed, have assumed that the solution of the gas-turbine problem is the easier of the two, and that few difficulties exist which have not already been met and conquered by Mr. Parsons in the steam-turbine. Many distinguished men have been of this opinion, and even Mr. Parsons himself, so early as his first turbine patent (No. 6,735 of 1884), appears to have been of opinion that the hot gas or internal-combustion turbine presented practically the same problem as the steam-turbine. In that specification he makes the following statement: "Motors according to my invention are applicable to a variety of purposes, and if such an apparatus be driven it becomes a pump, and can be used for actuating a fluid column, or producing pressure in a fluid. Such a fluid pressure producer can be combined with a multiple motor according to my invention, so that the necessary motive power to drive the motor for any required purpose may be obtained from fuel or combustible gases of any kind. For this purpose I employ the pressure producer to force air or combustible gases into a close furnace of any suitable kind, such as are used for caloric engines, into which furnace there may or may not be introduced other fuel (liquid or solid). From the furnace the products of combustion can be led, in a heated state, to the multiple motor, which they will actuate. Conveniently, the pressure producer and multiple motor can be mounted on the same shaft, the former to be driven by the latter; but I do not confine myself to this arrangement of parts." Clearly here Mr. Parsons intended to apply his invention to the gas-turbine as well as to the steam-turbine, and in this paragraph he outlined the fundamental idea of nearly all subsequent proposals of gas-turbines. Many other inventors

* Address to the Junior Institution of Engineers delivered Nov. 3, 1905.

Digitized by Google

have followed him, but I may only mention two well-known names—those of Ferranti and Stodola. Both have proposed turbines similar to this, with more or less elaboration, as well as other modifications intended to overcome certain difficulties.

In a very able paper read before the Institution of Mechanical Engineers last year, Mr R. M. Neilson discusses various cycles of operation which can conceivably be applied to gas-turbines, and he calculates the efficiencies of these cycles in various combinations. More recently, too, the subject has excited great interest in America, and very interesting articles are to be found in the *Engineering Magazine* by Dr. Charles E Lucke and Prof. Sidney A. Reeve. These gentlemen take somewhat opposing views of the position of the problem. In most of the recent discussions upon gas-turbine problems, it has been recognised that the temperatures possible in the cylinder gas-engine are impossible for the gas-turbine. It has been fully proved by many investigators, including myself, that the temperatures quite common in ordinary gas-engine practice range as high as 2,000deg. C., although in the best practice, for most economical results, 1.500deg. C. or 1,600deg. C. appears to be an upper limit. With the temperatures of 1,500deg. C. or 1,600deg. C a first-class modern gas-engine of about 50 h.p. will give an indicated efficiency of 35 por cent. At the same time the negative work of the cycle is so low that the mechanical efficiency of the engine may be as high as 86 per cent., or even over. If one realises what the temperature 2,00deg. C. means, it becomes very evident that no turbine constructed either on the lines of Parsons or Laval could possibly be made to work with continuous supply of such gases; 2,000deg. C. is considerably over the melting point of platinum. It is much higher than the temperature at which cast iron flows from the crucible, or, indeed, the temperature of the interior of the blast furnace itself. Any blades of iron, steel, or, in fact, any other material—even firebrick itself—becomes fluid or semi-fluid at this temperature. It is obviously hopeless, therefore, to attempt in the gas-turbine temperatures which are quite feasible in the cylinder engine. This fact, as I have said, is generally recognised. It is accordingly said by those who take a favourable view of the gas-turbine, that it is necessary to supply the turbine with gases at a much lower temperature. Mr. Neilson fixes the temperature of 700deg. C as one which steel turbine blades would probably stand without too rapid deterioration. I fear that on this point I must differ from him, because, in my experience, oxidation of steel and even iron is a fairly rapid process at this temperature. Nothing new has been proposed as to the thermodynamic cycle of the gas-turbine, so that all reasoning upon efficiencies depends upon the deductions already made from internal-combustion engine practice.

Seeing the impossibility of constructing a turbine with materials to stand a high temperature, many have proposed to convert bigh temperature into kinetic energy, so that, instead of having work stored up in the gas in the form of heat, the heat shall disappear, and the energy of the heat be transformed into motion of the gaseous particles at a high velocity. Such proposals, then, include the compressing of a gaseous mixture to, say, 50lb. or 60lb. above atmosphere, the igniting of that mixture within a combustion chamber at constant pressure, and the expansion of the mixture through an expanding jet of the Laval type, so as to drop the temperature and obtain its equivalent in kinetic energy or velocity of the gaseous particles. The rapidly moving particles at the relatively low pressure and temperature are then allowed to impinge upon rapidly rotating blades of sickle configuration, and they are supposed to give up their energy of motion to those blades, and so expend work upon the turbine. This appears to be the most feasible of all the gas-turbine proposals, so I will proceed to examine it a little more minutely. Success by this cycle of operations requires (1) a rotary or turbine compressor of high relative efficiency; (2) an expanding nozzle which shall ensure that free expansion is quantitatively equivalent to adiabatic expansion behind a piston; (3) a rotating turbine of such construction as to secure very high efficiency of transformation of kinetic energy of the moving gas into effective work available at the turbine shaft.

Assuming air to the working fluid and specific heat to be constant through the temperature range, it is easy to calculate the efficiency of the Joule or Brayton cycle, which these operations in effect represent. It would be useless to attempt to work a turbine at a pressure so low as to be relatively inefficient compared with the gas-engine, so I have chosen a Joule cycle of, say, 48 per cent. ideal efficiency, which in a cylinder gas-engine would probably give in practice about 30 per cent. indicated efficiency. For this ideal efficiency the pressure of compression would require to be 141lb. per square inch absolute. To give power with a reasonably small pump, I shall assume a maximum temperature of 1,700deg. C. That is, assuming a perfect compressor and a perfect nozzle expander, the temperature would only fall from 1,700deg. to 750deg. C. Plainly this temperature would be too high for a Laval disc with blades. In order to get a reasonable temperature on expansion, it would be necessary to assume a maximum temperature in the combustion chamber no higher than 1,000deg, and this would bring down the temperature after complete expansion to about 500deg., which, no doubt, steel turbine blades can be expected to stand for some considerable time. With these assumptions, however. the gas-turbine would not be very economical as compared with cylinder engines, even assuming all difficulties overcome. The theoretical and practical difficulties, however, are very serious indeed. To begin with the question of an efficient air compressor. I am not aware of any turbine compressor capable of compressing up to 140lb. absolute from atmosphere with anything like 60 per cent. efficiency. Before success could be attained, this efficiency of compression, so far as diagram is concerned, should be at least 90 per cent., in order to allow for unavoidable mechanical and other losses in the subsequent processes. It has, it is true, been proposed to substitute cylinder compressors operated from the turbine, instead of turbine compressors; but this, it appears to me, would be equivalent to abandoning at once all the advantages of the turbine principle. If reciprocating cylinders are to be used for compressing, there is no objection to using them also for expanding. No gas-turbine with cylinder compressors could, in my view, succeed.

Assuming, however, even 90 per cent. efficiency from a turbine compressor, and assuming that we have a compressed gaseous mixture burning freely in the combustion chamber at the desired pressure and temperature, we have yet to face the problem of the expanding nozzle. It is always assumed that with the use of an expanding nozzle, temperature drop can be as certainly attained as with an expanding piston in a cylinder. This, it seems to me, has been by no means proved. You will all recollect Dr. Joule's famous experiment with two vessels immersed in water and connected together by a pipe having a stop-cock upon it. Air was compressed into one of those vessels, the water round the vessels stirred, and equilibrium obtained, while the other vessel was rendered as vacuous as possible. The stop-cock between the two vessels was opened, and it was then found that when the water was stirred again no disturbance of the equilibrium ensued. This, of course, meant that although heat was lost in the one vessel, giving velocity to the gases, it was gained in the other vessel by the impact of the gases against the walls. Joule modified this experiment by placing the two air vessels in separate water containers. He then found that the temperature of the one vessel dropped, due to expansion, but the temperature of the other vessel rose as much as the first dropped. Now apply this experiment to reasoning on the behaviour of the flame in an expanding nozzle. Assuming the two vessels to be connected together by a Laval nozzle, and assume that while in the nozzle the gases experienced the full temperature fall due to adiabatic expansion. Immediately, however, on contact with the walls of the second vessel the velocity of the particles would be stopped, and the temperature would be restored to a point somewhat above the original temperature—that is, the mass of expanding flame in the pressure vessel would gain heat by the amount the first vessel lost. That is the result of the final process. It will be easily recognised that to obtain a sufficient tem-

Digitized by Google

perature drop in an expanding nozzle necessitates the practical absence of turbulent motion of every kind—that is, to expand adiabatically the jet must be so constructed that there is an absolutely smooth flow from high pressure to low, and no impact or loss of velocity from any cause whatever. So far as I understand expanding jets, no adiabatic expansion so perfect as this has ever been obtained.

Assume, however, that the efficiency of expansion in such a jet is, say, 90 per cent. We now come to the question of the efficiency of conversion by the turbine blades. In many calculations from diagrams it is assumed that the efficiency of conversion of motion into work is practically perfect. This, however, is by no means the case in present turbines. Even the steam-turbine, high as its efficiency is compared with the reciprocating engine, has no very high efficiency of conversion in any of the forms of turbine at present on the market. That is, if we assume a mass of gas to exist in a compressed state in a reservoir, and we choose to expand this mass of gas in two ways, for the sake of comparison (1) behind a piston and (2) by means of a Laval jet and turbine, we shall find that the efficiency of conversion of the turbine, once high velocity is attained, does not exceed 80 per cent. In this respect the efficiency of conversion of rotating turbine blades is inferior to that of a moving piston in a cylinder. The reason of this is obvious. It is impossible to so arrange the impact of a rapidly moving gas with a turbine blade or blades in such manner as to entirely avoid turbulent motion. The impact, for example, of swiftly-moving gases on a fixed surface results ultimately entirely in turbulent motion, which restores to the gas or to the blade struck all the heat which has disappeared in temperature fall due to adiabatic expansion. What is true of a fixed blade is to some extent also true of the moving turbine blades. A certain proportion of the energy existing in the gas in the form of motion is inevitably lost whenever this gas comes into contact with any solid surfaces. So much is this the fact that in designing steam-turbine blades for any type of turbine, the shape of the blades, the shape of the space between the blades, both moving and fixed blades, or fixed jet and moving blades, is of the first importance, and it has only been found by experiment that certain shapes of blades and passages have a much higher efficiency of conversion than other shapes. In this respect, too, the turbine principle is inferior to the cylinder and piston. In a cylinder, gases expanding behind the piston, the efficiency of expansion may be considered to be 100 per cent., and even an efficiency of compression in many gas-engines is also the same order. I do not here refer, of course, to heat losses due to conduction, or anything of that kind, but to efficiency of adiabatic compression or expansion.

Although the efficiency of expansion is relatively low for gases in steam-turbines, yet the turbine offers a great advantage in total work obtained from steam. This is due to the fact that the turbine avoids initial condensation; and, further, it permits of the utilisation of a very long range of expansion at the low-pressure end, which is not available in the case of steam-engines. By saving, therefore, in minimising initial condensation, and in obtaining added work from pressures wasted in the ordinary steam-engine, the Parsons steam-turbine more than compensates for any inefficiency of expansion as compared with the cylinder engine. It is well known, however, in turbines of practically all constructions, including Mr. Parsons, that the efficiency of the steam-turbine at the high-pressure end is not so great as that at the low-pressure end. This is partly due to difficulty of adjusting the velocity of blades to suit the necessarily varying velocities at different points of the flow of the steam. This, however, is a small difficulty with the steam-turbine, but it is a very great difficulty with the gas-turbine. Compared with cylinder expansion, I cannot see how it is possible with present knowledge to obtain an efficiency of conversion in a gas-turbine greater than 80 per cent. This, of course, is partly due to the high velocity of the issuing hot gases. To produce an efficient gas-turbine, therefore, on the favourite cycle so much discussed recently, it is necessary first to have, as I have said, a very efficient compressor, a very efficient expanding nozzle, and a very efficient conversion when the moving gases strike the turbine blades. Using the numbers I have suggested, of 90 per cent. efficiency of compression, 90 per cent. efficiency of nozzle expansion, and 80 per cent. efficiency of conversion in turbine, we have, with a cycle having negative work equal to 0·4, the following efficiencies: to get 0 4 of work in compression, we shall require 0·445 of work put into the compression. On expanding in the nozzle we shall obtain 0·9 only of the total energy of the flame gases in the shape of kinetic energy, and of that 0·9 we shall only get 0·8 returned in the shape of available work by the turbine part. That is, we shall get a total work from the turbine of 0·72, and deducting the negative work, 0·72 – 0·445 = 0·275—that is, from a cycle which should give us 0·6 in work we shall only get 0·275, or about 22 per cent. The practical efficiency of an engine of this kind will only be 22 per cent., even assuming the high efficiencies of compression and jet expansion which I have mentioned. In my view, no such efficiencies of compression or jet expansion are at present known, and accordingly there appears no likelihood of the production of any gas-turbine which can rival the reciprocating gas-engine in efficiency and in economy. To produce such a turbine requires the solution of three problems: (1) an efficient turbine compressor, comparable in efficiency with cylinder compression; (2) an efficient nozzle expander with a higher efficiency than 90 per cent.; (3) an efficiency of conversion of kinetic energy of the moving gases into work delivered at the turbine spindle of greater than 80 per cent. Either these problems must be satisfactorily solved, or else new materials discovered which will stand temperatures which at present melt firebrick. The outlook, I fear, is not hopeful.

This thermal efficiency of 22 per cent. assumes no losses in the combustion chamber due to heat conduction, no losses in the expanding jet due to heat conduction, and no losses in the turbine itself from the same cause. Considering the losses in gas-engine cylinders of small size, it would not be too much to allow in a turbine a heat flow loss of at least 25 per cent. This, of course, reduces the efficiency from 22 per cent. to 16·5. In arriving at this figure, I have assumed that no greater loss would be incurred from heat flow in the turbine than in the cylinder engine; but even with reduced temperatures when striking the turbine, the very fact of requiring a reservoir for combustion to operate, and the forcing of the whole of the hot products through a relatively small nozzle, necessarily means greater loss than I have assumed. Assuming, however, no more loss than I have given, an engine with an efficiency of only 16½ per cent. of the total heat given to it could not compete with internal-combustion motors of existing construction. It may be said that the advantage of continuous rotation is so great that even at this low efficiency the gas-turbine would be successful. Personally, I doubt it very much, because the mechanical difficulties with gas-turbines would be much greater than the mechanical difficulties of the steam-turbine. In all steam-turbines, as you, I am sure, know, it is necessary to work with relatively small clearances between the tips of the blades or shrouding and the enclosing casing. This is also true as to endwise clearance between fixed and moving blades. Comparatively small clearances are necessary for economy. The use of even temperatures so high as 400deg. C. or 500deg. C., by introducing unequal expansions, greatly increase the difficulty of obtaining economy. No doubt if a plentiful supply of relatively tow-temperature gases under considerable pressures could be obtained, these gases might with advantage be expanded in a nozzle, and used to operate a turbine. To carry this idea into effect has already been attempted, as I have said, by Mr. Lanchester, and there is some hope of operating in this way. I fear, however, that the temperature of the gases in the exhaust in the gas-engine are too high as they stand to be so used. Gases, however, from an exhaust or air supercompression engine, such as I have lately been working with, could no doubt give considerable efficiencies in turbines. I do not see, however, any solution of the gas-turbine problem here, because the amount of energy available for the turbine after the gases leave the gas-engine is too small for consideration in connection with any really high-power machines.

Digitized by Google

Some of the difficulties I have discussed with you have been mentioned by Dr. Lucke. He adopts the view that jet expansion is not as efficient as piston expansion, and here I agree with him. No doubt the type of jet expansion has to be carefully considered, and the efficiency of a jet as a means of converting the expansion from a high pressure to a low into kinetic energy depends entirely upon its configuration, and the design of the proper areas and relative lengths for the nozzle. All this, however, is as yet a relatively new field, and much study will be required before any certainty can be attained in the design of expanding jets. Prof. Reeves, in another able article which I have already mentioned, differs from Dr. Lucke, and considers that he has overstated the difficulties of the expanding jet. He accordingly takes a more favourable view of the turbine problem. There is a great deal of truth, however, in what Dr. Lucke has said. Even the best expanding jets yet known appear to have a low efficiency, and nothing is known of the efficiency of expansion starting from flame temperatures. Apart from the mechanical efficiency of the expansion, as I have already pointed out, the heat loss due to conductivity will be great in such nozzles.

I quite agree with Prof. Reeve, however, that the more hopeful line for the gas-turbine lies in the use of steam to provide the working fluid under compression without a compressor, and in the heating of this steam when produced by a very small quantity of combustible mixture of gas and air under pressure. Such a turbine would be a compromise between what I may call the flame-turbine and the steam-turbine, and it presents more possibilities; but its efficiency would not be high, although no doubt such a machine could be got to operate mechanically with fair success. This line of work depends upon the fact that negative work may be greatly reduced by using steam as working fluid, when steam is heated highly by internal combustion of a relatively small amount of inflammable gas and air. This proposal is more hopeful, but for success, even, it requires temperatures, in my view, too great for existing turbines to stand with economy. This proposal may be considered to be analogous to that of an excessive superheat, as used in an existing steam-turbine. Many methods have been discussed which depend upon the use of regenerators. I have a great distrust of regenerators, so far as engine work is concerned. Many able men have proposed regenerative contrivances from the time of Stirling, in 1817, down to the present day, but I am not aware of any actual working engine which has ever succeeded in practice using a regenerator.

From what I have said, you will see that my view of the future of the gas-turbine is not favourable; but, notwithstanding, the subject is so fascinating that many inventors and scientific men will doubtless continue to investigate the problem, and possibly new solutions may be discovered which are not dreamt of to-day. I am the last man in the world to deprecate daring in any practical and scientific work, but I would advise the junior engineers—members of our institution—to avoid the subject except as a scientific study. I fear there is little hope for a young man to make a position and a business success of any internal-combustion turbine, so far as our present knowledge carries us.

INSTITUTION OF ELECTRICAL ENGINEERS.

Inaugural Address.*

BY JOHN GAVEY, C.B., PRESIDENT.

In tendering my thanks for the high honour you have conferred on me, may I say that I fully recognise that I have been selected as a representative of the great body of telegraph engineers, the original founders of this Institution, as well, perhaps, as a representative for the time being of the new and growing telephone industry, rather than because of any merits of my own? Under the circumstances, and in view of the fact that these industries have not been reviewed recently, I propose with your permission to attempt that task in my address.

One of the penalties attached to advancing age, whether of individuals or of institutions, is the periodical loss of old friends or co-workers in the field in which we are labourers. Last year the President had to announce the loss by death of Major-General Webber. This year it is with deep regret that I have to refer to the death of Mr. W. E Langdon, one of our earliest members, for some time secretary and late president of the Institution. It was my good fortune to be closely associated with him from the early sixties, and I need scarcely say to those so well acquainted with his work as the members of this Institution are, that in his death we have lost one of the very able, energetic, and upright of our colleagues. Another well-known figure in the telegraphic world has also passed away in the person of the late Mr. Gerhardi, a gentleman closely associated with cable enterprise, he having formed one of the group of pioneers connected with the 1856 Atlantic cable, and later having been for a long period the general manager of the Direct Spanish Cable Company.

Before I commence the main subject of my address I may, perhaps, refer to one of two questions in which the Institution is largely interested, and in which its members are taking an active part. Dealing first with the Engineering Standards Committee, and more especially with the important work entrusted to the committee on electrical plant, the latter has appointed sub-committees to consider the following subjects: (1) generators and motors; (2) transformers; (3) prime movers for electrical purposes; (4) physical standards; (5) telegraphs and telephones; (6) cables; (7) electrical tramways; (8) electrical nomenclature: (9) electric automobiles; (10) electrical plant accessories; (11) publications and calculations. Some of these committees have reported, and all the work is well in hand, but it necessarily in many cases can only progress slowly if it is to be of a permanent character. It is difficult to overestimate the advantages, both to the profession and to the public, that will ultimately result from the labours of these committees. Again, in reference to the proposals made at the electrical congress held in St. Louis last year, to the effect that the revision of the existing electrical standards should be undertaken, and that an endeavour should be made to arrive at an international agreement on the subject of the standardisation of electrical nomenclature and rating of machinery, you will be glad to hear that the preliminary steps have been taken to carry out the views of the congress, and it is to be hoped that satisfactory conclusions will ultimately be arrived at.

The art of telegraphy considered in its broadest sense as a means of conveying intelligence over distances beyond the reach of the human voice may be classed under three different heads: (1) the communication of a limited number of definite orders or items of information by certain prearranged arbitrary signals. Under this heading may be included railway signalling, lighthouse signals, fire-alarms, and other kindred uses. (2) Communication of all classes of information by means of alphabets, either arbitrary or those in common use, including semaphore and flag signalling, Morse and other signals, printing and writing telegraphs. (3) Communication by actual exchange of speech, the telephone.

Telegraphs for Special Requirements.

Under this heading, one of the most important of the applications of telegraphy is that of directing and controlling the movements of trains on railways. For this purpose a modification of the old semaphore telegraph was introduced in the early railway days, mainly for the protection of traffic at stations and crossings. The range over which a mechanical semaphore can be worked is about 1,000 yards as a maximum, and the introduction of electricity for the working of telegraphs was soon followed by the invention of electrical miniature signals or indicators, placed in railway cabins, from which the outdoor manual signals were worked in accord with the indications recorded electrically. By this means the range of the signals was extended so as to cover the whole length of a section, and this led to the practical introduction of the block system of working traffic. Successive improvements in the electrical apparatus have been introduced—for example, on single lines this apparatus is now associated with the train staff

* Delivered at the meeting of the Institution last night.

Digitized by Google

or tablet, without which no driver is allowed to enter a section of line, and as a second staff or tablet can only be withdrawn at the far end when the first train has arrived, the possibility of two trains meeting on a section is obviated. Repeaters of various types which show the position of points, the indication of signals, the presence or absence of trains in defined localities, and other information, keep the signalman advised of all the facts with which he should be acquainted, and it is not too much to say that the safety and regularity with which the heavy railway traffic in this country is conducted is largely due to the work of the electrical engineer. Lately definite advances have been made in two directions in this field of applied electricity. In the first, complete electrical systems of actuating points and signals have been introduced, the apparatus providing interlocking gear and indicators which give the signalman positive information as to the position of every point and signal; the working being easy, rapid, and apparently reliable in so far that every eventuality and cause of trouble appears to have been foreseen and provided against. This method admits of working points and signals at distances far in excess of the manual system, such distances, in fact, only being limited by considerations of safety and convenience, and the heavy and cumbersome lines of levers that under old methods could in many cases only be worked by the full exertions of the signalman's strength can now be replaced by miniature levers, which only need intelligence to work them.

In another direction automatic methods have been designed for working outdoor signals directly by the action of the train itself, its entry, continuance in, and exit from a section being faithfully followed by the appropriate movements of the semaphores. In one system sets of batteries consisting of a few cells are connected across the running rails in each section, and in all sections that are clear the corresponding batteries actuate relays which, either through the agency of compressed air or by means of electromotors, move and retain the semaphores at "line clear." The entry of a train into a section short-circuits the local battery, the relay tongue is withdrawn by its retractile spring, and the signals are automatically placed at danger.

In a recent journey across the American continent, where hundreds of miles of desert are traversed by single lines of railway, with numerous sidings for the crossings of trains, I watched with great interest the perfect and regular working of the signals without the direct intervention of human agency. Each section was, of course, guarded by two signals, one for the up and one for the down traffic. As the train left one section for another, the signal guarding the former moved from danger to clear, whilst that guarding the latter moved from clear to danger. This method, of course, involves the necessity for bonding the rails throughout, although others have been designed which are actuated through special conductors. Automatic signals appear to meet a definite want on certain classes of railway, although, no doubt, the day is far distant when the trained signalman will be dispensed with at complicated junctions and stations. It is not too much, however, to say that without the various methods of electrical control that have been devised and which are in general use, it would be utterly impossible for the great railways of the world to carry one-half the traffic they are now dealing with daily with safety and dispatch. In this branch of electrical work steady progress is being made, and, apart from the question of haulage, the extension of the methods of electrical control will probably be considerable in the immediate future.

Fire-alarm signals have within the last few years assumed a position of considerable importance, owing to the growth of great cities, the increasing height of commercial buildings, and the large quantities of combustible material necessarily stored in the great centres of population. Starting from a simple alarum which was merely the old fire-bell worked electrically, complete systems of fire alarms and indicators have been devised, which, when actuated from any given point, give the appropriate signals at all the fire stations concerned, and admit of a rapid concentration of the necessary fire plant at any given spot in an incredibly short space of time. America has been in the past, and probably still is, in the forefront in the matter of fire-alarm appliances, and in my recent visit to that country I witnessed one example of the alacrity with which fire-engines can be called to any given spot. We had been visiting a number of telephone exchanges in New York and neighbourhood, and were motoring down on the long avenues on Manhattan Island. As we passed one shop, I noticed that some children leaning out of a first-floor window had just set fire to the canvas sun blind, which was burning over an area of half a square yard, so that it had only just been set alight. Before we had got out of sight of the burning blind we were passed by a steam fire-engine, a fire-escape, and a hose reel.

For the purpose of transmitting defined but limited items of information for special instructions or for making demands, innumerable electrical appliances have been designed, but there is a general tendency to replace such apparatus by telephones which simply extend the range of speed the natural method of intercommunication to any distance, and which render these subsidiary aids unnecessary.

(To be continued.)

HULL TELEPHONES.

Political papers always assert that little notice should be given to isolated by-elections, but when a succession of by-elections result in a given direction attention has to be and is given to the trend. Something similar goes on with regard to municipal telephones. An interested reader taking up a particular paper, or, for the matter of that, almost any paper at random, will be sure to find, if the plain figures of a balance-sheet show a profit, that profit attributed to bad book-keeping, bad finance, too lenient a looking at or writing down depreciation, or too little put aside as a stand-by—every reason, in fact, to demonstrate the dishonesty of municipal finance. It does not matter whether the figures deal with Glasgow, Guernsey, Brighton, Portsmouth, or any other town, they are all wrong. Now the half-year's figures *re* Hull are available, and, as in every other case, these figures to the ordinary mind spell success, and we maintain prove success. We are interested to hear what particular sins are laid on the Hull Corporation and their consulting engineer in this case. Here are the figures:

Revenue Account for Half-Year ended Sept. 30, 1905.

LOCAL GOVERNMENT BOARD LOANS.

Last week we dealt somewhat briefly with the methods of the Local Government Board in granting or refusing loans for electric lighting. This week we have carried the matter farther, and given a series of facts which justify, we think, the opinions expressed below. As these opinions reflect somewhat seriously on the Local Government Board procedure, we wish to express at once our high appreciation of the good work the Board has done through its inspectors in preventing municipalities from juggling with their accounts. The firmly enforced rule that new loans must not be used to replace defective machinery on which there is still capital outstanding is to be highly commended. We also wish it to be clearly understood that while we in this article and elsewhere in this issue comment strongly on the methods of Mr. Ross Hooper, we do so in no personal spirit, looking upon him as the mouthpiece of the Local Government Board. Coming to our subject, under the Electric Lighting Acts Parliament reserves the right to grant or refuse electric lighting orders. Having granted powers to a local authority, it rests with the elected representatives of the ratepayers to decide how much money shall be expended for electric light and power distribution purposes. The ratepayers back their representatives' actions by being responsible for any deficits which may arise. The November elections then become the effective means of checking extravagant expenditure and defective management. So far all is clear, but lately the Local Government Board, which sanctions the loans, have conducted their inquiries in such a way as to show a disregard both of the parliamentary obligations of the undertakers and of the expressed wishes of the ratepayers. The case of Rochdale emphasises this point. In the first few years the undertaking was not able to meet all its capital charges, and from time to time the ratepayers have been called upon to pay in all five thousand pounds to clear off annual deficits. The Corporation, composed of business men, were convinced that the undertaking was a sound one, and asked for some forty-two thousand pounds for extensions. The ratepayers, in spite of the deficits they had had to bear, so far agreed that not one of them opposed the loan. It remained for the Local Government Board inspector only to throw doubt on the soundness of the undertaking. He delayed the granting of the loan in consequence for a considerable and inconvenient period of time. In other places he has lectured local authorities on extravagant expenditure. A *résumé* of the early days of municipal lighting should convince him that then the great fault was in the opposite direction. The councillors of the various towns were so timid that the consulting engineers were forced to lay down small plants, which in a few years became quite useless when dealing with the load. We could give the names of a dozen towns offhand where practically every item of generating plant first installed is now either displaced or not used, due to its small size. When replacing such plant a considerable loss has had to be borne by the ratepayers. Councillors have gradually been convinced that electric supply undertakings are sound, and that extensions must be made on a reasonably large scale. The action of the Local Government Board in this respect is well illustrated at Torquay. The case is an exceptional one, and the result of the last inquiry is not yet to hand. If the loan is granted, we shall be much interested to see for what period. Thus the Board have refused a loan which would enable the Corporation to build an economical station to replace the existing one. They are now considering a proposed loan of nine thousand five hundred pounds for tinkering with a station

Digitized by Google

which we condemned on the day it was opened seven years ago. Mr. E. Manville, in his evidence at the last inquiry, said that when the work was completed the station might serve to supply the lighting, power, and tramway load for three years. If the Corporation extended their mains as they should do (not one-half of the streets have now mains in them), we are sure that it would not serve so long. Still, assuming that for nine thousand five hundred pounds the present station can be made to serve for three years more, what will happen then? The new station on a site where water and coal can be easily obtained must then be constructed. Having done this, it would be obviously absurd to work both stations, and we are sure that the good plant in the old works will be removed to the new. In so doing, the whole cost of the proposed structural alterations, the foundations, the induced-draught plant, the pipe and other connections, and the general erection charges become valueless. We believe that the loss incurred by the removal will be more than a third of the proposed expenditure. The special depreciation, therefore, due to the cheeseparing policy of the Local Government Board will involve the Corporation in a loss of at least one thousand pounds a year for the next three years. We are amazed at the proposal being even considered by an engineer of Mr. Hooper's standing. One more point, and then we are finished. A regular query has been put to municipal authorities at these inquiries recently: "Why have you not considered the taking of a supply in bulk from the local power company?" We would ask the Local Government Board, "Why have you not considered the most unsatisfactory position of these power companies?" Only one—*i.e.*, that at Newcastle—has paid a dividend, and while the others are, many of them, only starting, it must be remembered that so far they have been financed by manufacturing firms who look to their profit from the supply of machinery. Power distribution over large areas for power purposes will, we think, be eventually successful in the manufacturing districts of this country in spite of these methods of promotion and, what is more important, in spite of the cheapness of coal in this country. Power distribution in districts where lighting only is needed will never be successful in our opinion, due to the low power factor of the demand and the high cost of the underground mains to meet the maximum demand. In concluding, we would remind the Local Government Board of a fact which company advocates always slur over—*i.e.*, that cheapness of municipal supply needs to be considered as well as the balance-sheets. It is the correct policy for a municipality to so reduce its charges that it does not make that profit the absence of which the Local Government Board deplores.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

MUNICIPAL ELECTRICITY.

SIR,—Referring to the report under the above heading of the action of Mulholland *ats.* the Hammersmith Borough Council in your issue of the 27th ult., may I, as solicitor for the defendant, point out that the necessity for reduction "by mutual agreement" arose from the fact that there had been a deliberate overcharge by the Corporation, in that they undertook to supply continuous current and alternating current at a uniform rate, and then, notwithstanding this, charged, not for the continuous current that the motor-generator or transformer supplied, but for the alternating current that worked it, and this they endeavoured to continue even after the fact was brought to their knowledge. The result of the county court proceedings was to vindicate to the full my client's contentions, and to expose the systematic overcharge deliberately made, the amount claimed being reduced by the further amount my client had throughout stated he was entitled to have taken off—viz, £16. 3s. 8d. This left a judgment in the plaintiffs' favour of an admitted amount of £36. 13s. 7d., with costs. After setting up against the ratepayer every defence that the ingenuity of counsel could invent, the plaintiffs withdrew their judgment, the costs of claim and counterclaim being set off the one against the other.—Yours, etc.,

J. MOVERLEY SHARP.

London, W., Nov. 4, 1905.

ENTERTAINMENT OF KINDRED INSTITUTIONS BY THE INSTITUTION OF ELECTRICAL ENGINEERS.

SIR,—I shall be deeply indebted to you if you can find space for a short notice of the plans of the Council of the Institution of Electrical Engineers for 1906 in the next issue of your valuable journal, and I send you the following notes for you to deal with in any way you think fit.

Arrangements have been set on foot by the Council of the Institution of Electrical Engineers to entertain next year the kindred institutions in Europe and America, who, as it will always be remembered, have shown such lavish hospitality to the members during their visits abroad. Official invitations to visit Great Britain as guests of the Institution have been sent to the American Institute of Electrical Engineers, the Canadian Electrical Association, the Associazione Elettrotecnica Italiana, the Elektrotechnischer Verein, the Verband Deutscher Elektrotechniker, the Schweizerischer Elektrotechnischer Verein, and the Société Internationale des Electriciens.

The date for the arrival of the foreign guests has been fixed for the last week in June, 1906, and the visit will probably extend over about a fortnight. The programme exists, of course, in outline only as yet, but the present idea is to spend about one week in London, which will give an opportunity to the guests to see the new electrical developments and to make excursions in the neighbourhood. It is then proposed to make a tour through some of the principal industrial centres in the United Kingdom to visit works and provide local entertainments for the visitors.—Yours, etc.,

G. C. LLOYD, Secretary.

ELECTRIC LIGHTING ACTS, 1882 AND 1888.

SIR,—I am directed by the Board of Trade to state that their attention has been called to the large number of instances in which they have in recent years found it necessary to revoke provisional orders which have been obtained by local authorities under the Electric Lighting Acts, or in which local authorities having obtained provisional orders have entered into agreements with companies for carrying the order into effect, these agreements being in many cases *ultra vires*, or, at least, of doubtful validity.

It appears to the Board that it is undesirable that a local authority should apply for a provisional order without having a definite intention of exercising the powers under the order when obtained, and in future the Board will not be prepared to grant an order to a local authority unless they are satisfied that the powers will be exercised either by the local authority themselves or in exceptional cases by a company (to be named in the order) where special power is taken to transfer to the company with a limited period.

I am at the same time to state that the Board have observed that there is a growing practice for individuals or unregistered companies or firms to apply for provisional orders under the Electric Lighting Acts. In such cases the Board, having in view the undesirability of individuals or unregistered bodies exercising statutory powers involving the breaking up of streets, have inserted in the order, as granted, a provision that the powers under the order shall not be exercised unless within a fixed period they are transferred to a registered company approved by the Board. In the majority of cases the company is named in the order.

Digitized by Google

This procedure has proved to be unsatisfactory and inconvenient. In some cases the orders have lapsed by reason of the grantees being unable to form a company with a capital sufficient for the purposes of the undertaking, and in others the submission to the Board of the proposal to transfer has been postponed to so late a date as to leave insufficient time for the due consideration of the matter.

In these circumstances the Board have decided that in regard to any future application of this nature, they will require that the proposal to transfer shall be submitted to the Board not less than three months before the expiration of the period fixed by the order for the completion of the transfer.—Yours, etc, T. H. W. PELHAM.

MILAN INTERNATIONAL EXHIBITION, 1906.

SIR,—I have been asked, as chairman of the electrical section, to invite attention to the special opportunities offered to all those interested in electrical matters in this country by the above exhibition, and hope that you will personally interest yourself therein with a view to ensuring that a representative show of the varied products of British electrical industries worthy of their growing manufacturing importance and international standing may be made thereat.

The British Government has shown a practical interest in the exhibition by a grant of £10,000 towards the cost of the formation of a British section, and have approved the appointment of a British Commission.

The participation of leading firms in all the general lines of British manufacture is assured, and it is hoped that the electrical industries will be adequately represented. The King of Italy has given £4,000 in prizes, to be awarded by the international jury in the various sections of the exhibition, of which a prize of £200 is to be given for the best method of detecting high-voltage currents without danger to the operator.

The comprehensive character of the electrical divisions of the exhibition will be gathered from the enclosed details relating to the section for land transportation (electric traction, telegraphs, and telegraphs), and that of manufacturing and decorative arts (lighting and heating). The inducements to exhibit are evidently as great as the Italian authorities are able to make them, and, in addition, the greatest of all inducements will be the fact that the present is the first international exhibition ever held in Italy.—Yours, etc, (Signed) CHARLES P. SPARKS,

Chairman of the Electrical Trade Section.

P.S.—Detailed information regarding the exhibition may be obtained on application at the offices of the British Commission at Oxford-court, Cannon-street, E C.

IMPERIAL NOTES.

NEW ZEALAND.

In the course of a previous note under the above heading we referred to the legislation whereby the New Zealand Government reserved unto themselves all water power in the country, thus causing many private schemes to be dropped. From information now to hand, it appears the Government are at last making a start to utilise this water power for electrical transmission. It is not intended, then, to pursue a dog-in-the manger policy. In the public works statement of Sept. 8 last provision is made for a vote of £53,000 for the purpose in question. The total amount of water power available in New Zealand may be put down at 550,000 h.p. in the North Island and 3,450,000 h p. in the South Island, or, in round figures, 4,000,000 h.p.—estimated as brake horse-power at the turbine shaft—for the whole country, but these figures are by no means exhaustive or final. It will be gathered from the accompanying table that the £53,000 in question represents but an insignificant proportion of the total contemplated expenditure, which is £3 640,000, and provides for the utilisation of 150,000 b.h p. There are several schemes projected, varying considerably in magnitude, but the proposed initial outlay is evenly distributed between them except in the case of Opiki, the smallest of all, which would seem to be neglected for the moment.

Scheme.	Brake horse-power.	Estimated cost.	Proposed vote.
Huka	30,000	£1,000,000	£10,000
Hutt	12,000	340,000	10 000
Clarence	25 000	600,000	10,000
Opiki	10 000	250,000	—
Heviott	25,000	600,000	10,000
Hauroko	40,000	850,000	10,000
General	—	—	3,000
Total	150,000	£3 640,000	£53,000

Speaking generally, the greatest obstacle against water-power schemes in New Zealand is that the transmission lines will need to be very long, the water in most cases being a great distance from the large towns. In spite of this, it is the opinion of prominent engineers on the spot that several of the projected schemes will be profitable investments. The possibilities involved should certainly not be lost sight of by manufacturers at home, as the fruition of these schemes would mean placing some good initial orders for plant, and the supply of cheap energy which it is the object to render available for manufacturing and other purposes, would certainly stimulate developments not only in the existing large towns, but also along the transmission lines, thus bringing in train a large amount of new work.

TRANSVAAL.

Johannesburg—The Municipality's electricity supply and tramways undertaking is making steady progress towards completion we learn. It cannot be said, however, that a normal state of working has been reached yet. The present supply of electricity for lighting purposes is obtained partly from the Council's own station and partly in bulk from outside companies—viz., the Rand Central Electric Company and the Robinson Deep Gold Mining Company—the demand amounting to about 1,500 kw. The new station now under construction will be equipped with Oechelhauser engines worked by producer gas, and coupled to generators of 9,000 kw. aggregate output, the former being supplied by Messrs. W. Beardmore and Co., and the latter by Messrs. Siemens Bros. and Co. The inner area of the town will have a supply on the three-wire, direct-current system, with 460 volts between the outers, while the outlying suburbs will be supplied with alternating current from a two-phase system. The voltage on the primary side will be 3,000 per phase and the frequency 50. The secondary voltage will be 400 between the two outers of a three-wire system, and in most places only one phase will be available. Power will be supplied from the same station for working the tramways, which comprise 52 miles of track. The first instalment of this system is expected to be ready at the end of the present year. Provision is made for 100 cars, and the whole scheme represents a total capital expenditure of about £1,500,000. Mr. J. F. I. Thomas is the general manager of the Johannesburg electricity supply and tramways undertaking, Messrs. Mordey and Dawbarn being the consulting engineers. It may be added that the town has a population (white and coloured) of 160,000 and a municipal area of about 80 square miles.

CANADA.

Algoma—The Algoma Power Company, Limited, are utilising a water power on the Michipicoten River in the district of Algoma, Ontario, being situated seven miles from the mouth of that river, where it enters Lake Superior, on the north shore. The development is under a head of 128ft., and the first installation of plant will consist of two units of 2,100 i.h p. each. It is not expected that this installation will be completed before about next spring, when a resident engineer will have to be appointed. As further developments of the undertaking are probable, the lot of the successful applicant for this post should be a happy one. The headquarters of the company are at Berlin, Ontario.

Wiarton.—A project is on foot to supplement the supply of electricity at Wiarton, Ontario, Canada, from a source of water power some eight miles distant. The existing electricity works contain alternating-current generating plant of 100-kw. capacity and 25 kw. in direct-current arc-

Digitized by Google

lighting machinery. Instead of extending this plant, it is proposed to develop the outlying source in question, where some 500 h.p. is available for utilisation. This is another example, if but a minor one, of the attention which is now being given in Canada to the development of the water power in which the country is so rich. Three-phase transmission seems to be the ruling practice in connection with all these schemes. It may be added that Mr. Robert Millar is the resident engineer at Wiarton.

THREE-PHASE INDUCTION MOTORS ON SINGLE-PHASE MAINS.

It has long been known that three-phase induction motors can be run off single-phase mains under more or less normal three-phase conditions by means of split phase arrangements involving the use of condensers and choking coils. Tests taken under such conditions have seldom been published, owing to the comparative uselessness of the arrangement so long as reliable cheap condensers were unobtainable. Of recent years, however, the manufacture of condensers has improved considerably, and a certain amount of interest, therefore, attaches to some tests recently made in the above direction by J. Dalemont (*Elektrotechnische Zeitschrift*, Nov. 2, 1905).

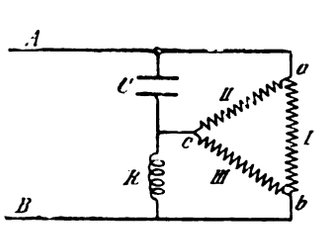

FIG. 1.

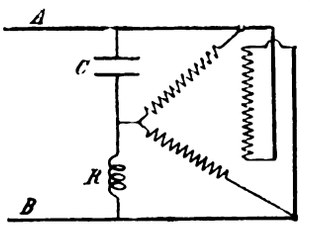

FIG. 2.

The motor tested was a standard three-phase 1-h.p. one running at 1,500 r.p.m., and arranged for either 120 volts star-coupled or 69·5 volts mesh coupled, the latter arrangement being used during the tests. Three sets of tests were made: (1) as an ordinary three-phase motor with three-phase supply; (2) as a single-phase motor in combination with a condenser, C, and a choking coil, R, as shown in Fig. 1; and (3) as a single-phase motor in combination with a condenser, C, and a choking coil, R, and with one phase of the stator winding reversed, as shown in Fig. 2.

With the arrangement shown in Fig. 1 the voltages in the different stator phases bear a 60deg. phase relation to

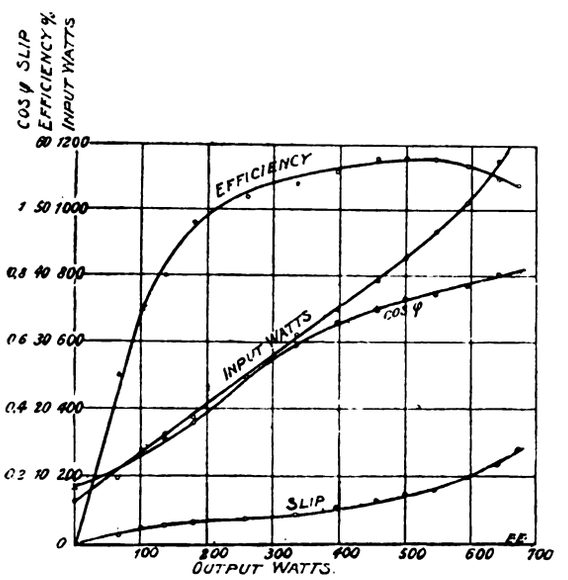

FIG. 3.

one another, whilst with the Fig. 2 connection the proper three-phase relation of 120deg. is obtained, and correspondingly better results. The results obtained on the three tests are shown by the curves of Figs. 3, 4, and 5 respectively. A complete table of results is given with each curve, and from these the following particulars for a load equal to about half normal load (the highest reached in the case of arrangement 2, Fig. 1) are abstracted.

The only condensers and choking coils available for the above tests were high-voltage ones, and so were connected through transformers instead of direct.

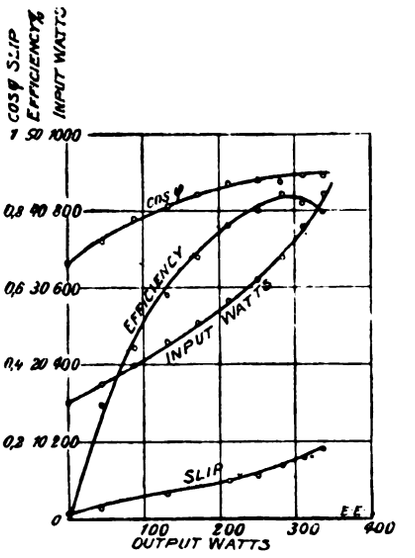

FIG. 4.

	Test as three-phase motor.	Test as single-phase motor connected as in Fig. 1.	Test as single-phase motor connected as in Fig. 2.
Output watts	336·6	339 5	326·5
Input watts	622	842	610
Speed (revolutions per minute)	1.4208	1,265	1 390
Efficiency	54 2%	40 3%	53·6%
Power factor	·59	·896	·87
Slip	·085	·189	·1
Current per phase	7 8	—	—
Total line current	13 5	11 75	9·95
Current in Phase I.	7 8	20·2	—
,, Phase II.	7 8	10 35	—
,, Phase III.	7 8	4 55	—
,, condenser	—	3 87	2·2
,, choking coil	—	·24	·1
Terminal volts	70	80	70
Volts over Phase I.	70	80	70
,, Phase II.	70	62	67·8
,, Phase III.	70	69·2	66·7

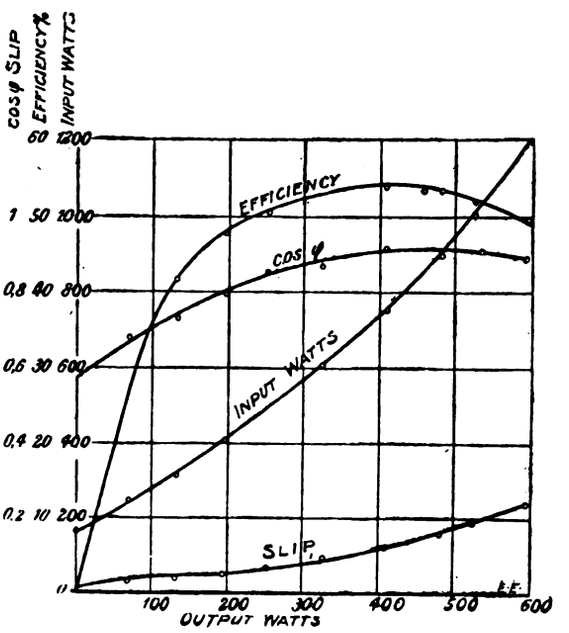

FIG. 5.

From the last series of curves (Fig. 5) it will be seen that very satisfactory results, especially as regards power factor, can be obtained when running a three-phase motor off a single-phase supply in this way. By varying the condenser capacity and the inductance of the choking coil, the torque

Digitized by Google

at a given speed can be controlled as well as the starting torque of the motor, as has been pointed out by Steinmetz.

ELECTRIC FURNACES.*

BY J. H. STANSBIE, B.SC., F.I.C.

The main object of this paper is to introduce to you some simple forms of electric furnaces which can be readily fitted up for experimental purposes. The literature of the subject is rapidly becoming voluminous, especially that which refers to the specifications of patents. Every known principle seems to have been appropriated in the hope that something useful may be covered, but in spite of its many successes the application of the electric furnace for industrial purposes is still in its infancy, and there is much hope for its future.

Electric energy may be converted into heat in a variety of ways, and the chief of these have been utilised for electric furnace work. Electric furnaces may be divided into two main classes: (*a*) Electro-thermic, in which the heat equivalent only of the electric energy passing into the furnace is utilised for producing physical, chemical, and metallurgical changes; and (*b*) electrolytic, in which part of the energy of the current is used up directly in effecting chemical changes, and the remainder for heating effects. The first class only will be dealt with in this paper.

There is only one direct way of converting electric energy into heat, and that is by putting material resistance into the path of the current which is carrying it. This resistance may be furnished by either a solid, a liquid, or a gas. If the resistance is offered by solid or liquid matter the apparatus is known as a resistance furnace, but if by gaseous matter it is an arc furnace. A large number of furnaces, both experimental and industrial, arrange themselves under these heads, and there are several sub-divisions according to the particular way in which the principles are applied. In the majority of these furnaces the resistance is in the path of the primary current. There is, however, a resistance furnace in use which does not appear to have passed through the laboratory stage, but to have been developed at once for industrial purposes. It is based upon the transformer principle, and consists of a cored coil for carrying light alternating currents of high potential surrounded by an annular space or hearth lined with refractory material in which a continuous circuit of the metal under treatment carries the heavy induced currents of low potential, and offers the resistance necessary to develop sufficient heat for its fusion. Its best known form is the Kjellin furnace, although others claim to have introduced important modifications. Kjellin uses currents of 80 to 90 amperes at a pressure of 3,000 volts in the primary, and 30,000 amperes at seven volts in the ring of metal in the hearth, which has a capacity of 35cwt. of steel. Furnaces of this type having a capacity of a few pounds should prove very valuable for the preparation of pure metals.

In resistance furnaces generally the resistance is either in or out of contact with the material to be heated, or the material itself offers the resistance. Also, either direct or alternating currents may be used, the most economical being heavy currents of low pressure. Hence it is necessary to use transformers with alternating currents brought from a distant power station. The terminals by which the current is led into and out of the furnace are almost invariably carbon rods or blocks, although water-cooled metal electrodes have been used. In some furnaces a combination of arc and liquid or solid resistance is found most useful, and in this case the pressure must not be too low.

At present the ideal source of the mechanical energy for dynamos and alternators is water power, and where this can be obtained the electric furnace flourishes. The enormous loss of energy taking place between the stoker's shovel and the flywheel of an engine puts the direct combustion of solid fuel out of court, but the use of gaseous fuel direct, especially of the waste gas from blast furnaces, will much improve the chances of electro-thermic processes being made successful generally. It is estimated that about 500,000 h.p. developed from falling water is being used in electric furnaces for the production of aluminium, carborundum, calcium carbide, graphite, iron, steel, ferro-alloys, etc. The Acheson furnace for carborundum, the Heroult furnace for steelmaking, the Stassan furnace for ore reduction, and the Keller furnaces may be mentioned as being in use in

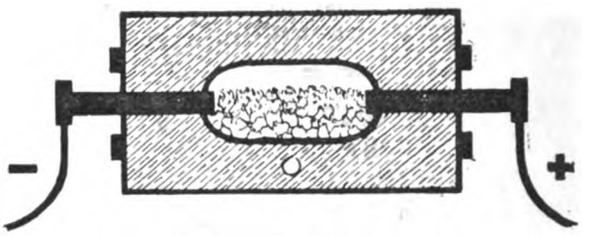

FIG. 1.

successful industrial processes, while the number of furnaces being used for the manufacture of calcium carbide is very large.

Experimental Furnaces.—A small resistance furnace for demonstrating the melting of metals is readily made by chipping the large face of a firebrick so as to form the cavity and two semicircular channels running from it to

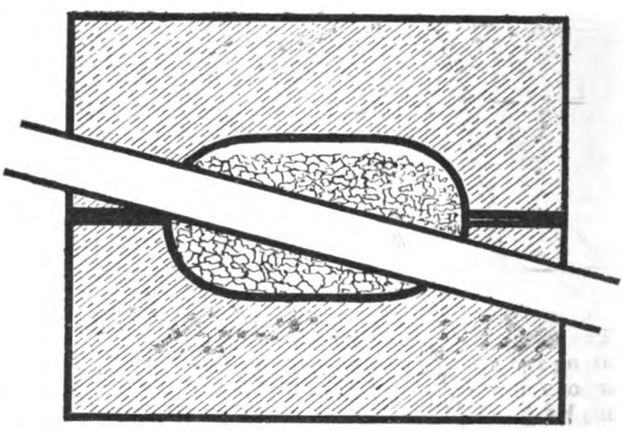

FIG. 2.

the ends of the brick. A second brick with a shallower cavity and similar channels serves for the top. The cavity forms the hearth of the furnace, and the channels allow of the introduction of two carbon rods which are fixed with their ends just projecting into the cavity. The metal is placed in the cavity, and covered with a layer of small pieces of carbon so arranged as to fill up the space between

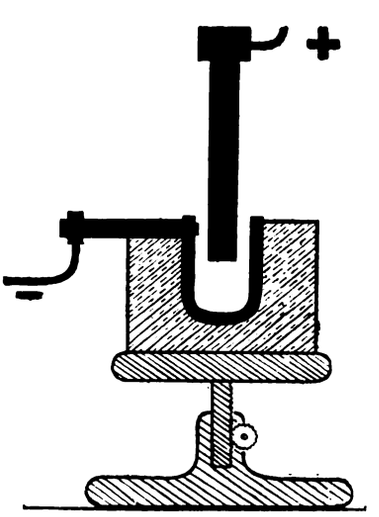

FIG. 3.

the carbon rods. (Arc carbons broken up serve the purpose very well.) The top is placed in position and the current switched on. The temperature rises rapidly, and a charge of cast iron is soon melted. This can be run from an inclined tap hole passing through the bottom of the cavity by plugging the upper end with a piece of the metal before

* Abstract of paper read before the Birmingham Electric Club on Nov. 4, 1905.

Digitized by Google

charging. The metal plug melts last, and the whole charge runs from the furnace in a continuous stream. A vertical section of the furnace is shown in Fig. 1. A slight modification of this furnace enables it to be used with a carbon tube. For this purpose an inclined channel is made in the walls of the hearth at right angles to the length of the bricks to hold the tube, the ends of which project from the sides of the furnace. The cavity is filled with carbon fragments to surround the tube and connect the rods. On passing the current into furnace a rapid increase in temperature takes place, and substances to be experimented with can be readily introduced into the tube. Reductions and fusions are rapidly effected. The tubes are easily made by drilling pieces of arc carbon of requisite length. See Fig. 2, which shows the furnace in vertical transverse section.

A small arc furnace of the Siemens type is easily fitted up. A hole is drilled in the side of a carbon crucible, and a carbon rod fitted tightly into it. The crucible is placed in a cavity in a fireclay block, which also supports the carbon rod along part of its length. The block is placed on a small iron table having a vertical rack motion, and a carbon rod to act as the positive electrode is fixed vertically over the crucible. When the charge has been introduced and the current switched on, the arc is readily struck by raising and lowering the table. The operation can be regulated by the same means. Fig. 3 shows the furnace in vertical section.

A more durable form of the Moissan lime furnace can be made with strongly compressed magnesite bricks. Two of the bricks are chipped out on corresponding faces, so as to form the crucible cavity and the channels for the carbon

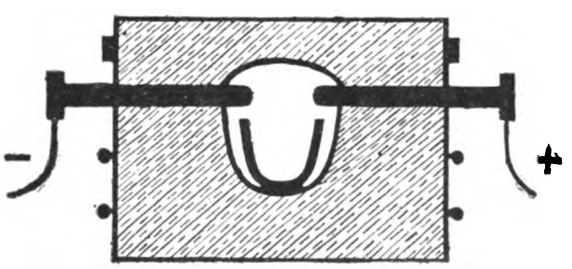

FIG. 4.

rods. They are then braced firmly together, and the top formed by a third brick, hollowed out a little to correspond to the cavity below. The electrodes are carbon rods, 1in diameter and 15in. long, having copper electro-deposited on part of their length to ensure good contact. The reactions are carried out in a shallow carbon crucible, and the majority of the fusion and reduction experiments requiring very high temperatures can be made in it. Chromium and molybdenum are readily reduced from their oxides. The current used in these furnaces varies from 100 to 200 amperes at a pressure of 110 volts in the mains.

A good idea of the interest taken in electric smelting by those who are in position to deal with the subject practically can be obtained from a review by M. Minet in the *Electro-Chemist and Metallurgist* for December, 1904. No less than 260 references, extending from Davy's work with the alkalies in 1808 to the present day, are given, and some 40 of these refer to calcium carbide alone. This shows that much attention is being given to reactions which take place at exceptionally high temperatures, and for the elucidation of which M. Moissan has done so much. One of the latest developments is that dealing with tantalum, the cheap production of which bids fair to mark an epoch in the history of incandescent lighting.

Electricity in Cotton Mills.—A Lancashire correspondent states that, following upon the starting of the electrically-driven Acme spinning mill at Pendlebury, near Manchester, and the announcement that the Kearsley Spinning Company's new mill at Prestolee, Farnworth, is to have electricity as the motive power, it is understood that another mill at Farnworth is arranging for a supply of electricity, and a mill to be built at Swinton is to be electrically worked.

EXPERIENCE ON THE ROAD: AN INCIDENT WITH WATER-COOLED TRANSFORMERS.*

BY G B ROSENBLATT.

Preconceived opinions in trouble work are a great hindrance in discovering true causes of difficulty. A case of rather unusual interest came to the writer's notice some while since. Three fair-sized water-cooled units connected in delta on a three-phase 14,000-volt system and supplying a lighting and small motor load were running hot. Their temperature had been steadily rising ever since their installation, until at the end of a year they showed a temperature rise of about 55deg. C. in the oil, even with an abundant supply of cold water flowing through the cooling coils. The maximum load possible could not tax the transformers more than 60 per cent. of their rated capacity, and there was no reason to believe that there were any cross currents between the transformers. Evidently the trouble lay inside the transformers.

Much has been said and written of late concerning deposits in transformer oil, and in some cases these deposits have caused considerable annoyance to transformer operators. Inasmuch as the transformers in question showed measured losses no larger than they were designed for, the conclusion was immediately reached that the cooling coils were not working properly. This conclusion was corroborated by the fact that the temperature of the water leaving the cooling coils was but little higher than that of the entering water. It was a fair presumption that the only thing which could affect the action of the cooling coils was a coating that would impair their conductivity. A deposit from the oil? Yes, of course. An inspection of the cooling coils showed them to be covered with a thin vaseline-like layer of about $\frac{1}{8}$in. in thickness—the sort of a deposit that may occur in any oil-insulated transformer without materially affecting its operation or temperature. However, it was decided that this was evidence that there was a deposit from the oil, and that while the coating on the cooling coils could not account entirely for the high temperature of the transformers, it undoubtedly helped and surely indicated a deposit in the ventilating ducts between the windings.

Accordingly, the feasibility of cleaning out the transformers was discussed, and an engineer was sent from the works to make an inspection and to superintend the cleaning operation. So imbued with the oil-deposit idea was everyone connected with the plant that the engineer from the works never doubted the cause of the trouble as stated, and that all there remained for him to do was to remove the cause. However, on removing some of the oil from one of the transformer tanks, he noticed the lightness of the deposit on the coils, and began at once to have his doubts. Nevertheless, he proceeded to have the oil removed from the tanks, if for no other reason than "to see what he could see." Meanwhile he took a walk about the plant and had a look at the general lay-out.

The transformers were installed in a separate house, containing, in addition to two banks of transformers, the lightning arresters and arc light regulators. The cooling water was obtained from an artesian well under the engine-room, and was pumped from the well through about 100ft. of iron pipe to the transformers. The iron pipe joined the brass tubing of the cooling coils about 2ft. from where the cooling coils entered the transformers, and the waste water from each transformer emptied into a concrete tail-race in the floor of the transformer house. The cooling water was quite cold, and had a queer but not unpleasant taste. Where it left the waste pipe from the transformers the concrete of the tail-race showed a reddish discoloration. A steel nut and an iron washer which had been in the race for some time were quite clearly outlined in red on the concrete. Probably there was iron in the water. Still, it might not be iron. At any rate, it was worth while looking into, particularly as there was nothing else to investigate until all the oil was removed from the transformers. So a section of the brass tubing at the joint between the cooling coils and the iron pipe was removed and the inside examined. Its entire inner wall was covered with a coating of a reddish-brown material, solid near the brass and softer and slimier towards the centre. The coating was about

* From the *Electric Club Journal* of Pittsburg.

Digitized by Google

¼in. thick, which in the ¾in. tubing of which the cooling coils were formed, left about ¼in. clear for the water—just enough to pass a lead pencil. That was why the transformers ran hot.

Now that it was evident that it was not the fault of the oil, the problem presented itself of how to clean the inside of the cooling coils. The deposit was clearly not soluble in water, or it would not have remained. The highest pressure that was available at the power-house failed to remove any particle of it. Various solvents were tried—salt, ammonia, vinegar—but nothing weaker than 50 per cent. hydrochloric acid seemed to attack the deposit. However, the hydrochloric acid attacked the brass. It was evident that if the tubes were to be cleaned without removing them from the transformers (which on account of the arrangement of the high-tension wiring would have been a most arduous undertaking), muriatic acid would have to be used and the job done with the utmost dispatch to prevent the brass being injured. Several gallons of the acid were obtained, mixed with water and poured into the tubes, the coils being filled from the bottom up to prevent water traps. From the sound of the disturbances, violent ebullitions must have taken place. When, after five minutes, the tubes were flushed by turning on the cooling water, the deposit came out in chunks. Such sections of the tubing that could be inspected seemed to have been thoroughly cleansed. The transformers were refilled with oil, and upon being tested under full load showed a perfectly normal temperature, the oil not rising over 35deg. C. The explanation given by the chemist who was consulted was that the artesian well water was acidulated and attacked the iron in the pipe from the well to the transformers, forming a salt of iron which was thrown down in the cooling coils by the heat of the oil. Had the cooling coils been of iron there would have been no such action, but they would have been slowly eaten away by the water.

One interesting feature of this case was the method of obtaining a full load on the transformers for the temperature run made after the cooling coils had been cleaned. As stated above, the maximum load available was about two-thirds of the rated capacity of the transformers. It was, therefore, necessary to find some means of energy consumption outside of the load. There were in the station two banks of transformers of like capacity, one bank which was running hot and another bank with which no trouble had been experienced. The troublesome bank was fed from a water-power plant some eight miles distant, the other from another water-power plant 18 miles away. To obtain full load, the low-tension sides of the two banks of transformers were thrown together and the water-wheels at the plant supplying the bank which was operating satisfactorily slowed down until they drew power enough through the transformers to constitute a full load.

ECCLES ELECTRICITY ACCOUNTS.

From the accounts of the Eccles electricity department for the year ended March 31, 1905, it appears that the total expenditure on capital account to that date amounts to £32,688. Abstracts of the revenue account and balance-sheet are given herewith.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.
To generation of electricity	1,260	13	9
Distribution of electricity	264	15	9
Attending and repairs to public lamps	72	7	0
Rents, rates, and taxes	98	10	8
Salaries of engineer and clerk (proportion of)	254	16	0
Establishment charges	59	0	6
Insurances	26	16	3
Interest and repayment of loans	1,874	6	5
Interest and commission charged by treasurer	23	1	3
	£3,934	7	7

Cr. Income.	£	s.	d.
By sale of electrical energy for private lighting	2,443	16	5
Public lighting	766	16	6
Meter rents	93	12	8
Sale of cinders	6	0	0
Fittings and repairs on consumers' premises	150	5	9
Balance, being deficit on revenue account	473	16	3
	£3,934	7	7

BALANCE-SHEET.

Dr. Liabilities.	£	s.	d.
Capital account—amount borrowed less repaid	29,521	5	3
Sundry creditors	220	2	0
Balance due to treasurer	1,418	2	1
Sinking fund, less repayment	114	19	9
Amount of loans repaid	3,180	14	9
	£34,455	3	10

FORTHCOMING EVENTS.

FRIDAY, NOV. 10.

Physical Society.—At 8 p.m., "Temperature and Efficiency of Thermal Radiation," by Mr. J. Swinburne; "Note on Constant-Deviation Prisms," by Mr. T. H. Blakesley.

MONDAY, NOV. 13.

Institution of Mechanical Engineers (Graduates' Section).—"Boiler-House Practice and Design," by Mr. E. Barr.

TUESDAY, NOV. 14.

Statistical Society.—At 5 p.m., "Statistical Skimmings from the International Congress," by Sir J. Athelstone Baines, C.S.I.

Institution of Electrical Engineers (Glasgow Section).—At 8 p.m., inaugural address by Mr. J. M. M. Munro.

Institution of Civil Engineers.—"Waterways in Great Britain," by Mr. J. A. Saner.

WEDNESDAY, NOV. 15.

Royal Meteorological Society.—At 7.30 p.m. (at Institution of Civil Engineers), "The Rainstorm of Aug. 24-26, 1905, in co. Dublin and co. Wicklow," by Sir J. W. Moore, M.D.; "The Aquameter," by Mr. W. B. Newton, Ph.D., F.C.S.

Institution of Electrical Engineers (Students' Section).—At 7.30 p.m., "Some Aspects of Electric Traction," by Mr. W. M. Mordey.

Society of Arts.—At 8 p.m., inaugural address by Sir Owen Roberts, M.A., D.C.L., F.S.A.

Dynamicables.—At 7.15 p.m., dinner at Trocadero.

THURSDAY, NOV. 17.

Institution of Electrical Engineers (Manchester Section).—At 7.30 p.m., inaugural address by Mr. S. L. Pearce, M.I.E.E.

Motor Exhibition.—Olympia.

FRIDAY, NOV. 17.

Electro-Harmonic Society.—At 8 p.m., concert (ladies' night) at the Holborn Restaurant.

Institution of Mechanical Engineers.—At 8 p.m., the seventh report to the Alloys Research Committee: "On the Properties of a Series of Iron-Nickel-Manganese-Carbon Alloys," by Dr. H. C. H. Carpenter, Mr. R. A. Hadfield, and Mr. Percy Longmuir.

Junior Institution of Engineers.—Nov. 18, at 2.30 p.m., visit to Messrs. Barclay, Perkins, and Co.'s Anchor Brewery, Park-street, Southwark Bridge.

Institution of Electrical Engineers (Manchester Section).—Nov. 24, at 7.30 p.m., address by Mr. J. Swinburne, M.I.E.E.

PERSONAL.

Mr. E. Stanley Shoults, A.M.I.E.E., has resigned his position as chief engineer and works manager of Aron Electricity Meter, Limited, in London, which he has held for nearly four years.

Mr. Noel Woodhouse, after being 12 years with the British Insulated and Helsby Cables, Prescot, has resigned his position with the firm as assistant contracts manager, and has commenced business with his brother, Mr. Alfred V. Woodhouse, as electrical engineers and contractors. Mr. A. V. Woodhouse, after being with the Brush Co., was until recently chief assistant engineer at Penarth for the British Electric Traction Co. Messrs. Woodhouse Bros. have taken offices at 20, North John street, to which address all inquiries should be made.

Of the 65 applications received by the South Shields Electrical Tramway Committee for a general manager for the new electric tramway system, the following five gentlemen have been selected for the final election: Mr. Richard Chadwick, A.M.I.M.E., chief assistant, Birkenhead Corporation tramways; Mr. Frederick Taylor, assistant tramway engineer, Bolton Corporation; Mr. John Williams, A.I.E.E., deputy engineer and deputy tramway manager, Rotherham Corporation; Mr. William Ogilvie, assistant rolling stock superintendent, Newcastle Corporation; and Mr. John Wilson, manager, South Shields Tramways Co.

Mr. M. H. Rooney, of the electric lighting station at Londonderry, has been presented by the staff of the local electricity works with a handsome dressing-case, suitable inscribed, on the occasion of his leaving Londonderry to take up the appointment of junior assistant electrical engineer to Limerick Corporation.

OPENING ADDRESS TO THE DUBLIN SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS.*

BY P. S. SHEARDOWN, MEMBER, CHAIRMAN FOR SESSION.

After some consideration as to what should be the subject matter of the address I am to have the honour of delivering to you this evening, it occurred to me that it might be profitable to try and incorporate in it information given and opinions arrived at by the authors of some papers presented at the recent International Congress at St. Louis, the complete *Transactions* of which, with the discussions thereon, have only recently been placed in the hands of members, and may be therefore considered practically the latest information procurable on the subjects dealt with. The papers read at the International Congress were delivered into eight sections: (A) general theory; (B) general application; (C) electrical chemistry; (D) electric power transmission; (E) electric lighting distribution; (F) electric transportation; (G) electric induction; (H) electric therapeutics. But it is to some of the papers read in Sections D and E and to the discussions thereon that I wish to confine myself this evening.

The first paper presented to Section 2 dealt with the generation of electrical power in Switzerland (Enrico Bignami). Switzerland is deficient in supplies of both coal and timber for fuel purposes, but possessed an inexhaustible supply of *houille blanche* (or white coal) in the Glacier Alps. The development of the electrical power industry makes it possible to develop this store of energy into a commercial commodity. The first water-power plants were the property of private companies. The example was soon followed by the civil authorities. Now the Government, following the example set by the companies and the towns, is beginning also to enter the field, and, having bought up almost all the railroads in the country, is preparing a law according it first right over all the water powers which can be utilised in transforming to electric traction the system of State railroads. The following facts were brought out by the paper. The country possesses 226 electrical stations, 162 being principal stations; together they represented a rated capacity of 180,000 kw. Of the 162 principal stations, 148 generate from water power, five with steam power, and nine with gas. Twenty-five important stations utilise not only water power, but also have installed gas or steam engines as a reserve for an eventual lack of water. The normal capacity represented by these 25 plants is 25,000 kw., with 10,000 kw. for the engine reserve. This necessity for reserve steam power would appear to increase the capital cost very much. The highest voltage directly produced is—for continuous current 2,250 volts, and for alternating current 10,400 volts. The kind of current generated varies largely, but 44 stations generate single-phase alternating and 38 three-phase alternating. The periodicity employed varies very much, but 40 or 50 cycles is most general. The territory provided for by the 120 principal stations referred to is inhabited by only 2,300,000 people, which works out at ·08 unit per head.

In the discussion notice was drawn to the very high load factor obtained in most stations described, there being only five stations of the entire list in Switzerland in which the ratio of average to maximum power is less than one half, and there were five stations mentioned in which the average load is above nine-tenths of the maximum. This result is largely brought about by the very large number of motors connected up on the condition that they are operated only outside the peak load.

The next paper gives some interesting figures dealing with the development of extra high-pressure apparatus for long-distance transmission work (Charles F. Scott). Present statistics show that the apparatus manufactured by the leading American companies for transmission at 10,000 volts or higher provides for the transmission of approximately 1,500,000 h.p., all by polyphase current, whereas 10 years ago there was but one single case of transmission of 200 kw. at 10,000 volts for a distance of less than 30 miles, this by single-phase. At the present time a large amount of power was being transmitted commercially at from 50 to 60 thousand volts, and 100,000 volts was already in view.

In a paper on the high-tension transformer in long-distance power transmission (John S. Peck), it is stated that the increase in manufacture by the Westinghouse Company is as follows: number of transformers, 971; output in kilowatts, 228,000; maximum voltage, 60,000; maximum capacity of any one transformer in kilowatts, 2,500. Transformers for long-distance transmission may be divided up into two general classes—oil-insulated and air-blast; the oil-insulated transformer being again divided into two general classes—self-cooling and artificial cooling. He mentioned that the self-cooling transformer has one great advantage over all other types in that no extraneous devices are necessary for cooling, so that if required for any kind of service where no attention can be given to the apparatus, the self-cooling transformer is the only satisfactory type, but its capacity is limited to approximately 500 kw. A number of different methods have been proposed and tried for carrying off the heat, but one method is now almost always used: this consists in forcing or siphoning water through coils of brass or copper tubes placed inside the transformer case below the surface of the oil. The air-blast transformer, as its name implies, is one in which the cooling is accomplished by means of a forced draught of air. Two separate passages are provided, one for cooling the coils and the other for cooling the iron. The air pressure is usually less than 1oz. per square inch, the power required for cooling being usually from one-tenth to one-fourth of 1 per cent. of the transformer capacity. On account of the difficulty of eliminating static discharges off the surfaces of the coil of the blast transformer, it has been impracticable to use this type of construction for pressures exceeding 33,000 volts, and the greatest successes have been obtained by voltages not exceeding 20,000, above which it is most satisfactory to use oil-insulated coils.

The discussion on this paper was very interesting, it being shown that, although a transformer can be designed for an efficiency of 98 per cent., this will cost twice as much as one with 96 per cent. efficiency, and that it was an open question, therefore, as to how high in efficiency it is commercially economical to go, as the interest on the cost of the transformer might readily be more than the value of the power saved. The discussion dealt very largely with the fire risks of oil-insulated transformers, one speaker drawing attention to the fact that if a fire starts near an oil-cooled transformer, and heats it up sufficient, it will turned into a gas producer, and that sufficient gas can be turned out to melt up all the ironwork and machinery in any power-house. The opinion with regard to relative fire risks of air or oil insulated transformers differed a good deal, but it was generally conceded that the danger of setting the oil on fire internally—that is to say, from the transformer itself—was very small indeed, but the danger of its being set on fire from external sources considerable, and that, therefore, oil transformers should be kept as far as possible away from switchboards or any other place where small fires or arcs are likely to be started. Some speakers went so far as to think that oil transformers should each be placed in fireproof cells, and other designers had made provision in case of a fire being started to let in water from the supply mains to the bottom of the transformers, floating the oil out either into a spare receptacle or away down the sewers. Another fact brought out was that there is very little advantage with regard to radiating heat in ribbing the insides of transformer cases, as the heat is easily passed from the oil to the iron, the heat potential drop being altogether between the outside surface of the iron and the air in contact with it.

A second paper on transformers was also read, being entitled "Notes on Experiments with Transformers for Very High Potentials" (Prof. H. B. Smith), one transformer described being for a secondary potential of 330,000 volts, which under test failed to produce potentials higher than 210,000 volts. The next was a transformer which successfully transformed from a potential of 200 volts to over half a million volts at 60 cycles per second, and was capable of disrupting a 48in. air-gap between sharp needle points.

A paper which created a great deal of interest among engineers connected with high-tension long-distance transmission was read by Prof. F. G. Baum, who has under successful operation the district of the Sierra Nevada Mountains of California, a transmission scheme which had apparently been operating without experiencing the troubles found on many other similar lines in other parts of the country. The paper stated that the system described had continuously in operation about 700 miles of line at 50,000 volts, 70 miles at 40,000 volts, and a great many miles at 3, 16, 10, and 5 thousand volts, and mentioned that in a short time some of these lines would be operating at 100,000 volts. The longest distance to which power is regularly transmitted is 200 miles. The amount of power available on the system is 43,650 kw., which will soon be increased by the addition of two 5,000-kw. generators. The author gave some simple methods of line calculations with regard to (1) circuits; (2) charging or capacity current; (3) rise in pressure due to charge in current; (4) regulation of transmission system; (5) electrical surging, giving in all cases practical examples illustrating the working of his formulæ.

Part 2 dealt with high-potential control, or the apparatus in use, and contained some practical information with regard to insulators, the author mentioning that they had in use glass insulators, porcelain insulators, and combinations of both porcelain and glass; in the mountains, away from fog, 7in. glass insulators with two petticoats did very well up to 40,000 volts, but to go from 40 to 60 thousand volts required a 14in. porcelain insulator with three petticoats. With regard to line operation, they had the lines patrolled from one to three times a week. Their line troubles were due to a few weak insulators, and in some localities they have a good many insulators shot off. Some of their unexpected causes of trouble have been crows or geese flying into the lines, cats crawling up the poles, green hay carried by wind across line, an engine starting up under the

* Delivered on Nov. 9, 1905.

Digitized by Google

lines, and a long-tailed rat crossing temporary 'bus bars. Their high-tension transformers had given very little trouble. He recommended that on test the primary of each transformer should stand a test about equal to double the star voltage for which the transformer is made. With regard to switches, they had found that the oil-break switch was the only one that will stand heavy duty, and that this type is less likely to produce violent surging on opening a circuit than has been experienced with the flare type of air-break switch. The writer gave illustrations of a line of cheap and satisfactory oil-break switches that they had designed and manufactured, these operating up to 60,000 volts; the switch referred to being capable of opening 10,000 kw. at 60,000 volts on short-circuit. With regard to lightning arresters, they pinned their faith to simple horn-type arresters made with single or double air-gap. Their general practice was to generate current at 2,300 volts and then step up, the primary of transformer being connected star with earthed neutral, the writer having come to believe that the earthed neutral had more in its favour than against it; and they took advantage of the earthed neutral, and very often installed a single transformer in a sub-station, one side going to line, the other to ground. Where the load was larger but did not warrant three transformers, two transformers were used on two legs of the primary and open delta on the secondary. They are not bothered by unbalancing of load at the power-houses. At the power-houses no fuses or circuit breakers are installed, as they prefer to hang on to a short rather than take the chances of being pulled out for every slight interruption; but at sub-stations the transformers were generally fused. All their energy is developed by water power, the size of unit having developed from 300 kw. in 1897 to the present 5,000-kw. unit. With this latter type they could instal 20,000 kw. in a building 100ft. long by 50ft. wide. Their greatest trouble is occasioned by the fog, and this in districts near the ocean settles on the insulation and reduces the insulation to such an extent that the pins, cross-arms, or poles, if of wood, are sometimes set on fire. In the mountain district with modern insulators their line troubles are nil. The author considers that the weak point of the transmission system is the insulator, and that with an insulator to stand 100,000 volts, in his opinion, this pressure is possible. To sum up, he thought it easier to operate a line, say, from 30 miles up, at 50,000 or 60,000 volts than at half that pressure, assuming that a considerable amount of power is transmitted.

The discussion on the paper confined itself largely to the lightning arrester. On most other systems working at lower voltage the trouble of getting rid of lightning on the line was very considerable. The writer of the paper, however, stated that lightning gave him very little trouble, and that practically all the lightning arresters he had tried provided instead of saving trouble for him, and the only type he used was an ordinary horn lightning arrester with a 4½in. air-gap, which would require a pressure of 90,000 volts to start an arc. The opinion arrived at finally seemed to be that by getting up the voltage as high as 60,000 the insulation of the line has to be made very much more perfect, and that hence lightning discharges which break down insulators on lower voltage systems were rendered comparatively harmless over the very large insulators employed on the line under discussion. A second reason for the immunity from trouble being ascribed to the fact that when transmitting a large amount of energy the higher the voltage the smaller the current, and the smaller the current the less the rise in voltage due to a surging current, and hence static discharges are less frequently produced.

(To be continued.)

APPOINTMENTS VACANT.

Electrician, Burnley Union. Wages, £2. 2s. per week. Applications by Nov. 15.

Switchboard Attendant, Southend Town Council electricity works. Salary, £1. 1s. per week.

Assistant Lecturer and Demonstrator in Electrical Engineering, Leeds University. Salary, £175 a year.

Laboratory and Workshop Assistant, Battersea Polytechnic, S.W. Commencing salary, 20s. a week. See advertisement.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office.

Wireman for electric light and power plant. Applications to Box 29, *Electrical Engineer* Office. See advertisement in last issue.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sell's Advertising Offices, London, E.C.

Junior Assistant. Wages, 30s. per week. Applications to Engineer, Electricity Works, Canterbury, by Nov. 18. See advertisement.

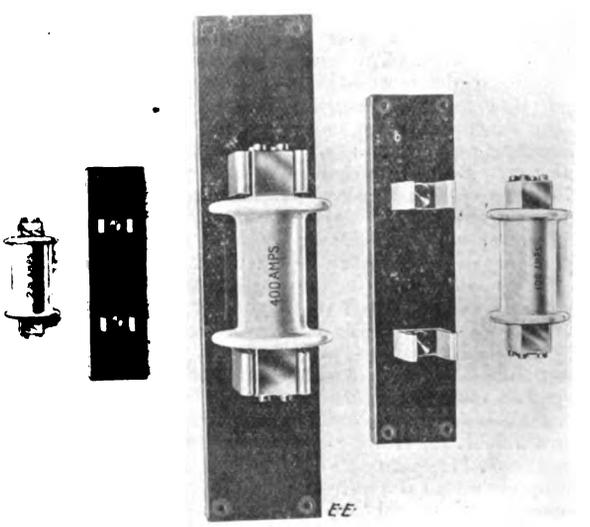
Representatives for an electrical contracting firm. Applications to Box G 33, *Electrical Engineer* Office. See advertisement in last issue.

Junior Charge Engineer. Salary, 30s. per week, rising to 35s. Applications to the Borough Electrical Engineer, 335, High-street, Cheltenham. See advertisement.

TRADE NOTICES AND NOVELTIES.

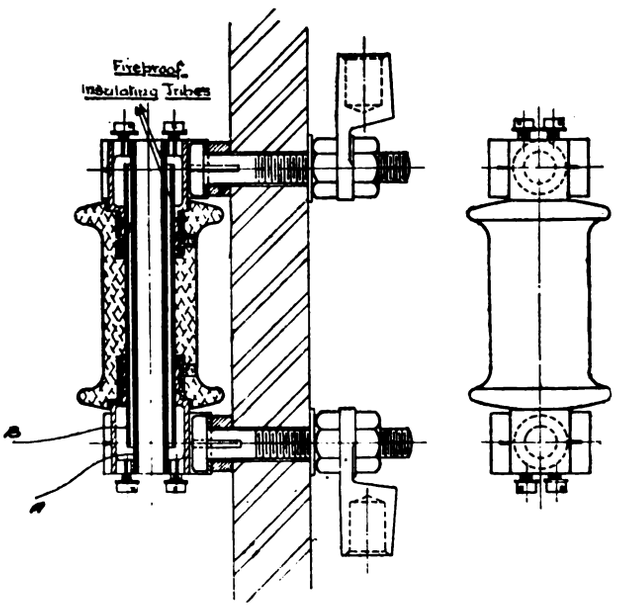
Tubular Fuses.

Accompanying are illustrations of the standard designs of tubular fuses manufactured by Messrs. A. Reyrolle and Co., Limited, Hebburn-on-Tyne. These fuses are made in all sizes from 25 amperes to 600 amperes for use on 500-volt circuits. One of the illustrations shows the construction in section, from which it will be seen that there are two thick asbestos tubes, A and B, inside the porcelain handle. The internal tube, A,



"The Reyrolle" 500-volt Tubular Fuse.

surrounds the fuse wire, and is most effective in causing the arc to be blown out when the fuse melts on a dead short. The external tube, B, is provided in order to keep the porcelain handle cool, and it will be seen from the illustration that an air space is contained between these two tubes. Ventilating holes are provided in the metal contacts on each end, and by this means the heat which must of necessity be generated on a fuse is dissipated, and, keeping the porcelain cool, minimises the risk of breakages. The material used for the fuse is bare tinned copper wire, and cheese-head terminal screws and washers are



Details of "The Reyrolle" 500-volt Tubular Fuse.

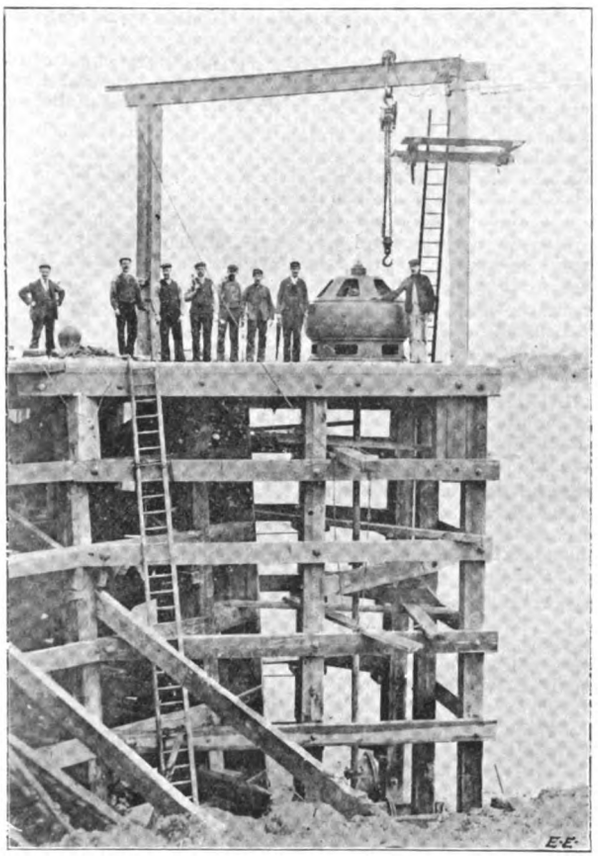
provided on each end of the holder so that the holder can be re-fused quickly and cheaply.

Motor-Driven Centrifugal Pump.

We illustrate herewith an interesting, if small, installation in which direct-current transmission is employed for actuating a vertical motor driving a pump at the Alexandra Docks, Newport, Mon. The motor is of the Westinghouse direct-current multipolar type, is supplied with current at 500 volts, and develops 320 h.p. It drives a centrifugal pump at 300 r.p.m., the pump raising a million gallons of water per hour against a head of 25ft. The water is pumped from the river into an adjacent dock for the purpose of keeping up the level of the

Digitized by Google

water in the latter. In the power-house a Westinghouse generator of 300 kw. capacity has been installed. This generator is rope-driven at 325 r.p.m., it being of sufficient capacity to work other motors besides that illustrated. The overhead transmission line consists of bare copper conductors of about ·5 square inch sectional area, these being suspended on special



Motor-Driven Pump at the Alexandra Docks, Newport, Mon.

hook insulators supported on steel lattice poles. The work was carried out by the British Westinghouse Electric and Manufacturing Company, Limited, of Manchester and London.

LUTON ELECTRICITY ACCOUNTS.

In the accounts of the Luton electricity department for the year ending March 31, 1905, the total expenditure on capital account is given as £32,607. The following are abstracts of the revenue account, balance-sheet, etc.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.
To generation of electricity	981	4	2
Distribution of electricity	50	3	5
Attending and repairs to public lamps	33	3	7

LEGAL INTELLIGENCE.

TRAMWAY CASE.

At the Erith Petty Sessions on Tuesday last the manager of the Erith tramways (Mr. Arthur Coventry) was summoned for allowing a person not then licensed as required by the Act to act as driver of a tramcar. For the defence it was urged that an unlicensed driver or conductor might be employed in a case of emergency. After hearing evidence, the magistrates dismissed the case.

COMPANIES' MEETINGS AND REPORTS

BRITISH THOMSON-HOUSTON.

The ordinary general meeting of this Company was held on Wednesday last, Mr. G. Franklin presiding.

The CHAIRMAN said that the printed accounts and report (which we published last week) were in themselves sufficiently explanatory of the position of the Company, and only went to show that the Company had had a very much longer row to hoe at Rugby than it had expected when it started. The difficulties that arose in connection with manufacturing there, and the difficulties which had since become manifest by severe competition, both home and foreign, made the Company's trials sufficiently serious to require constant attention on the part of the Board. Attention had been called to the increase in the item of interest on loans. Last year the item was £29,047, and in the present accounts it stood at £30,601. The increase was entirely due to the fact that last year the General Electric Co. stood as an ordinary creditor for a large amount which did not carry interest, but as the sum had not been paid off, it now carried interest at the rate of 3 per cent. He was glad that attention had been called to that point, because it enabled the directors to give the shareholders an assurance in regard to the Company's financial position. Since March last the directors had been able to dispose of, at par, £350,000 of securities, part of the securities which stood in the balance-sheet at £518,302. The effect of that operation was to reduce the Company's liabilities on the other side of the account.

The report was adopted.

BUENOS AYRES GRAND NATIONAL TRAMWAYS.

The annual general meeting was held on Friday last, Mr. J. J. Courtenay presiding.

The CHAIRMAN, in moving the adoption of the report (copy of which appeared in our issue of last week), stated that the percentage of expenses to gross receipts was 74·28—a slight reduction compared with those of the previous year. The number of passengers carried was 20,026,548, or an increase of 665,801. Had the change to electric traction been postponed any longer the Company would undoubtedly have entered upon a period of decadence, the signs of which had already made themselves disagreably apparent in their traffic returns. During his stay in Buenos Ayres last autumn he went over the whole system, and he did not think than anyone, after studying the situation as he had done, could fail to recognise the unrivalled facilities for rapid transit which the joint systems would be able to offer the public or to be convinced of the excellence of the Company's prospects. To give an illustration of the extent of their system, he might state that the lines now open and under construction, if they were in London, would extend from Addison-road Station, near Olympia, to the Agricultural Hall and Dalston Junction, *via* the Marble Arch and Oxford-street in one direction, and at right angles in the other direction from Victoria Station to Primrose Hill. Referring to the progress of the "electrification" of the joint system of the Grand National and the New Tramways Companies, he reminded the shareholders that the funds for the work were provided in March, 1904, by the issue of £450,000 of the conversion debenture stocks of the two companies. Owing to accidents actual construction in Buenos Ayres could not be commenced until January, 1905. By Sept. 30 24 miles of line had been converted, and the directors learnt by cable that the total converted to the 31st ult. was 32½ miles, and that the sections opened to public service by electricity at the same date covered a distance of 24 miles. In view of results already obtained, the directors intended to make every effort to proceed continuously with the work of electrification, and to carry it on to completion. A

Digitized by Google

scheme had been formulated, which for the present was confined to dealing with the simplification of the Company's share capital, but which also made provision for the future consolidation or unification of the debenture debt as soon as the proper time arrived.

The report was adopted.

MIDDLEWICH ELECTROLYTIC ALKALI.

The annual report of this Company states that the operations for the year ended Aug. 31, 1905 showed a net profit of £4,745. 18s. 7d. To this is to be added the amount brought forward from last year, £1,374. 9s. 4d., making a total of £6,120. 7s. 11d. The directors propose that this amount be applied in paying. on account of the arrears of dividend upon the cumulative preference shares, the amount of one year's dividend at the rate of 7 per cent. per annum on all the preference shares issued prior to April, 1902, and a dividend at the same rate upon all the preference shares issued since that date, calculated, as regards all instalments paid on such shares since Aug. 31, 1902, from the several dates of payment of such instalments up to Aug. 31, 1905. This will absorb a sum of £5 601. 3s. 9d., and leave £519. 4s. 2d. to be carried forward to the next account. The process continues to work satisfactorily, and there is a good demand for the Company's products. Towards the close of the year the erection of additional manufacturing plant was continued, and the Company is now in a better position for dealing with an increased volume of business.

DRAKE AND GORHAM.

The report of this Company for the year ended June 30 last (to be submitted at the meeting on the 16th inst.) states that, after payment of all charges, including bonuses due to staff, there remains a net profit of £10 821, which, with the £1,722 brought forward, makes a total of £12,544, which it is proposed to appropriate as follows: a dividend at the rate of 6 per cent. per annum, £7,500, placing to reserve £3,000 and carrying forward £2,044. The reserve fund will then stand at £12 000. The directors regard the increase of £2,173 in the net profit as satisfactory, for during the period under review there has been little improvement in the general condition of electrical business. The Company has been entrusted with the electrical equipment of a cotton mill in Lancashire, in which steam plant and generators of the latest type will be employed, the power amounting to upwards of 1,000 h.p. being transmitted electrically. It is anticipated that this work, which has been throughout designed by the Company's staff, will lead to important developments in the future. A large number of installations have been carried out during the year, and the work in hand on June 30 was greater than at the corresponding period of the previous year. Negotiations are in progress for the acquisition on lease of further premises for factory purposes, the present arrangements affording insufficient facilities for the manufacturing department of the business. At an extraordinary general meeting, to be held at the close of the ordinary meeting a resolution will be submitted authorising the reimbursement to the directors of expenses incurred in attending Board meetings, etc.

NEW COMPANIES REGISTERED.

P.M. Electric Manufacturing Co., Limited.—Capital, £2,000. Object: to carry on the business of manufacturers of and dealers in electrical apparatus and all accessories of motorcars, etc.

Telegraphic Code Co., Limited.—Capital, £2,000. Object: to carry on the business of authors, compilers, adapters, publishers, and sellers of telegraphic codes or secret ciphers, etc. Registered office: 12, Royal Exchange-buildings, E.C.

Cremorne Motors, Limited.—Capital, £30,000. Object: to acquire and carry on the business of A. E. Dobbs at the Cremorne Motor Works, Lots-road, Chelsea, as the Cremorne Motor Manufacturing Co. Registered office: Cremorne Motor Works, Lots-road, Chelsea, S.W.

Kepong (Malay) Rubber Estates, Limited.—Capital, £20,000. Object: to acquire rubber estates in the Federated Malay States and elsewhere, to adopt an agreement with the Malay Syndicate, Limited, and to carry on the business of rubber and general planters, cultivators, estate owners, etc.

Caoutchouc and General Trading Co., Limited.—Capital, £2,000. Object: to carry on the business of brokers of and dealers in indiarubber (both raw and manufactured) and of goods made wholly or partly thereof. Registered office: Bush-lane House, Cannon-street, E.C.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Hull.—The Tramways Committee invite tenders for 34 top covers for the cars.

Cardiff.—The Asylums Committee require tenders for generating plant. Tenders by Nov. 27.

Torquay.—The Town Council invite tenders for generators, booster, traction battery, and switchboard. Tenders by Nov. 20. See advertisement.

Manchester.—The Tramways Committee invite tenders for the supply of (*a*) tramcar trucks, (*b*) electrical equipments for cars. Tenders to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester, by 1 p.m. on Nov. 11.

London, W.—Messrs. Grice and Co., Addison Wharf, Warwick-road, Kensington, require a 10-ton electric derrick crane with 60ft. to 70ft. jib, continuous current.

Bermondsey.—Tenders for new plant, estimated to cost £5,390, will shortly be advertised for. An estimate is being prepared for condensing plant, for which tenders will be invited.

Ebbw Vale.—The Urban District Council invite tenders for free wiring and supply of incandescent lamps. Tenders by 12 noon on Nov. 25. Full particulars in advertisement columns.

Sao Luiz.—The Municipality require tenders for electric lighting of the town. Tenders by Dec. 15. Particulars may be obtained from the Municipal Secretary of Sao Luiz in the State of Maranhao, Brazil.

Rawtenstall.—The Corporation invite tenders for the electric light wiring and fittings of the new free library. Tenders to Messrs. Lacey, Sillar, and Leigh, 78, King street, Manchester, by Nov. 20. Full particulars in advertisement column.

Bridlington.—Schemes and tenders are invited for lighting the Quay Wesleyan Church, Bridlington, by electricity, also for supply and fixing of electric ventilating fans. Tenders to Mr. Samuel Dyer, architect, Bridlington, by 6 p.m. on Nov. 14.

Harrogate.—The Directors of the Frederick Hotels Co. invite specification and tenders for laying down electrical plant at the Hotel Majestic, Harrogate. Further particulars on application to the Secretary, 8, Bloomsbury-square, London, W.C.

Dublin.—The Dublin and Blessington Steam Tramway Co. invite tenders for the supply of sole-plates, clips, fang-bolts, fishbolts, and dog-spikes. Further particulars from Mr. P. H. McCarthy, civil engineer, 39, Westmoreland-street, Dublin. Tenders by Nov. 15.

Barrow-in-Furness.—The Corporation invites tenders for the supply and erection of a 500-kw. combined steam-engine and generator, balancer booster, switchboard, water-tube boiler, mechanical stoker, economiser, travelling crane, cooling tower, pipes, etc. Tenders by 12 noon on Nov. 13. See advertisement in last issue.

Bray (Ireland).—The Urban District Council invite tenders for the supply and delivery of 220 yards $^{7}/_{16}$ concentric paper-insulated and lead-covered cable for a working pressure of 200 volts, and 10 10-ampere alternating-current induction voltmeters, 100 volts, 60 periods. Tenders to Mr. P. MacDonnel, clerk, by 10 a.m. on Nov. 21

Cape Town.—The Cape Post and Telegraph Office invite tenders for telegraph and electric light material. Tenders will be received by the Chairman of the Tender Board, Control and Audit Office, Parliament street, Cape Town, noon on Nov. 22. Samples may be inspected and forms of tender, copies of specifications, together with any other information required, may be obtained on application to the Controller of Stores, General Post Office, Cape Town.

Spain.—The *Gaceta de Madrid* of Oct. 10 contains details of a concession for the construction of an electric tramway as an extension to that of the east of Madrid. Tenders must be sent in by Dec. 13 to the Director of Public Works, Madrid, in whose office particulars may be seen. A deposit of 1,899·95 pesetas, or about £60, is required to qualify any tender. Local representation is necessary. The same journal of Oct. 12 contains a notice of a concession granted to the Sociedad Los Tranvias de Zaragoza for the construction of an electric motor tramway in that city. The *Gacetas* may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

RESULTS OF TENDERS.

Gillingham.—The contract with Babcock and Wilcox, for the supply and erection of a new boiler, etc., has been sealed.

Aston.—The Town Council have accepted the tender of T. Johnson, at £1 387, for the superstructure in connection with the power station extensions.

Stoke-on-Trent.—The Guardians have placed with the Hart Accumulator Co. an order for renewing the battery at the workhouse, Newcastle, Staffs, with 114 of their standard lighting type cells.

Greenwich.—The Guardians have accepted the tender of Pritchetts and Gold, Feltham, at £85, for repairs to the batteries at their installation at Grove Park Workhouse, Lee, S.E., and also for maintenance of same.

Contract.—The Brush Electrical Engineering Co., Belvedere-road, have obtained a contract for 43 motors and a turbine alternating-current set for the equipment of the first cotton spinning mill to be erected in Portugal.

Bury.—The British Westinghouse and Electric Manufacturing Co. have received an order from the Corporation for six tramcars, with complete electrical equipment. The same firm is also supplying six tramcars and electrical equipments for the Mansfield and District Light Railway Co.

Battersea.—The Council have accepted the tender of Cochrane and Son, at £170, for a scheme to clean by occasional discharges of water from the pumps the large pipes in the river from the mud which is occasionally retained in the same. They have also accepted the offer of J. B. Garnham to purchase scrap copper at the central station at the rate of £68. 5s. per ton, and of Oswald and Son to purchase scrap iron at the rate of 20s. and 38s. per ton.

Dublin.—The Corporation have accepted the following tenders for extensions of plant in connection with the electricity undertaking: British Insulated and Helsby Cables, at £15,151, for mains extensions; Ferranti Limited, at £1,879, for sub-station switchboards, and at £160, for feeder panels at Fleet-street station; British Electrical Transformer Co., at £2,000, the city electrical engineer being authorised, if he considers the extra outlay advisable, to order the alternative design of regulating switch with 10 stops, at an additional £180.

Digitized by Google

London County Council.—The Highways Committee have received the following tenders for the supply of low-tension electric cables, feeder pillars, etc., for the tramways:

W. T. Glover and Co., Manchester*	£37,860	0	0
British Insulated and Helsby Cables, Prescot	38 060	15	10
W. T. Henley's Telegraph Works Co., London	38,154	13	9
Siemens Bros. and Co., London	38 541	0	9
Western Electric Co., London	38,628	7	7
Callender's Cable and Construction Co., London	39.723	15	0
St. Helens Cable Co., Warrington	40 756	10	5
National Conduit and Cable Co., London (incomplete)	40,197	0	0
Société d'Exploitation des Cables Electriques, Switzerland (incomplete)	45 169	5	0

* Recommended for acceptance.

For the supply of high-tension cables the following tenders were received:

Western Electric Co., London*	£20,549	16	0
Siemens Bros. and Co., London	20,670	16	6
W. T. Henley's Telegraph Works Co., London	20,719	6	6
British Insulated and Helsby Cables, Prescot	21,001	16	3
Callender's Cable and Construction Co., London	21,396	5	0
W. T. Glover and Co., Manchester	21.572	9	7
National Conduit and Cable Co., London	21.804	10	0
St. Helens Cable Co., Warrington	21 950	10	0
Société d'Exploitation des Cables Electriques, Switzerland (incomplete)	24,654	10	6

* Recommended for acceptance.

BUSINESS NOTES.

TRACTION.

Traffic Receipts.—The receipts of the Buenos Ayres Electric Tramways for the past week were £1,335. For the week ended Oct. 22 the receipts of the Havana Electric Railway show an increase of £1,200.

Beckenham.—The Urban District Council have resolved, on the recommendation of a sub-committee, to proceed with the necessary works for providing current for Penge tramways at an estimated cost of £13,000.

Batley.—The electrification of the line between Batley and Birstall is practically finished. It is intended, so it is said, to make the return fare 10d. between Batley and Bradford, which is 8d. less than the railway fare.

Bristol.—Charles Jarman was summoned for committing offences against the tramway company's by-laws and for assaulting a tramway inspector. He was fined 50s. and costs, or in default six weeks imprisonment.

Surbiton.—Among the provisions of the Bill which the District Council intend to promote in the present session of Parliament is one for power to repeal a portion of Section 32 (6) of the London United Tramways Act, 1901.

Dundee.—At the end of three weeks the results of the new four-stage fare system showed a decrease in receipts per car mile and a large increase in the number of ½d. passengers carried in comparison with the same period last year.

Fulham.—The London County Council cannot see their way to pave the tramway track along the route in Fulham with wood, and the Borough Council have again urged upon the County Council the urgent necessity for such a course.

Pontypridd.—At a meeting of Council on Tuesday last it was reported that the Board of Trade had sanctioned the borrowing of £18,000 for tramway purposes, £16,180 to be repayable in 30 years and the remainder in 15 years.

Rhos.—At a meeting of the Parish Council it was explained that the electric tramway company could not come to terms with Mr. Dennis respecting an extension of the system. The Council decided to approach Mr. Dennis on the matter.

Leeds.—Covered tops are to be provided for another 25 electric tramcars within the next fortnight. The work will be executed at the Corporation's depôt in Kirkstall-road, and the covers, it is stated, will be a great improvement upon those now in existence.

Perth.—The tramway system, as reconstructed and electrified by the Corporation, which was formally opened last week, is six miles in length, and has cost between £80,000 and £90,000, including the purchase price (£21,800) for the old system. The plant provides power to drive more than 40 cars.

Middlesex.—Much opposition has been evoked in the Stanmore district by the County Council's tramway extension scheme. The Hendon Rural District Council at a meeting last week passed a resolution against the scheme. The Wembley Council have also decided against an extension of the tramway system to Sudbury.

Southampton.—For using offensive language on a tramcar a man fined at the police court last week. The defendant was in volunteer uniform at the time, and claimed the privilege of changing at a junction without additional payment, though the prosecutors disputed defendant's right. The magistrates on this point decided in defendant's favour.

Cardiff.—The Trades and Labour Council have passed a resolution against the Corporation permitting advertising on tramcars. The Tramways Committee have been asked to receive a deputation from the tramway and vehicle workers' associations with reference to the charges of incivility, etc., made by the general manager of the tramways against the employés.

Glasgow.—The Corporation Tramway Committee and Clydebank Town Council have come to terms about the erection of bridges over the canal at Kilbowie and Dalmuir. It has been agreed that the Corporation construct bridges, 20ft. in width, with pedestrian paths of 5ft. on each side of the bridges, Clydebank to pay towards the cost of each bridge the sum of £300. The bridges will probably cost about £3,000 each.

Colchester.—A little boy, in crossing the road, was knocked down by a passing tramcar. The "life-guard" acted imperfectly, and the child's head seems to have been caught under it. The victim was dragged some 30 yards before the car could be pulled up, for, although the driver acted with the utmost promptitude, the rails were wet and greasy. When extricated the child was found to have been severely hurt about the head.

Darlington.—The tramways manager's monthly report presented to the Council shows that the total revenue on the Harrogate Hill and Eastbourne route for September was £624. 7s. 0½d., 200,242 passengers were carried, and the revenue per car mile was 7·72d.; on the Cockerton and Bank Top route £160. 1s. 7d., 50 625 passengers, and 5·22d. per car mile; on the Haughton route £60. 3s. 0½d., 17,002 passengers, and 5·63d. per car mile.

Wolverhampton.—The connecting of the Corporation lines with those of the British Electric Traction Co. on the Bilston-road has been completed, and one of the company's cars which has been fitted up to run on the Lorain system has made a trial through trip from Wolverhampton to Bilston. A number of the Lorain cars have been fitted with the gear to run on the company's lines, and it is hoped that before long they will be carrying passengers over both systems.

North-Eastern Railway.—In connection with the proposed electrification of the line between Newcastle and South Shields, which we reported some time ago, it is now stated that cable surveys of the line are now being made as a preliminary step, and after these have been completed it is expected that a start will be made with the laying down of the electric rails. It is also understood that the company will afterwards adopt the electric system on the light railway between Gosforth and Ponteland.

Swanage.—The engineer to the promoters of the proposed Bournemouth and Swanage light railway scheme waited upon the Urban District Council last Friday and laid before them plans and maps of the proposed route. A general explanation of the scheme was given, and in the end it was resolved by the Council to refer the matter to the Works Committee, who will report later. Asked by the engineer to express an opinion of the scheme as it stood, the Council intimated its approval subject to points of detail.

Sutton (Surrey).—The British Electric Traction Co. having failed to obtain the consent of the Urban District Council for a double track of trams down the High-street instead of a single one, as provided by their Act of Parliament, have given notice of their intention to apply to the Board of Trade for an order authorising the double track to be constructed. The tradesmen of the district have decided to petition against the proposal, on the ground that the construction of a double line along the High-street would leave insufficient space between the kerb and the outermost rail.

Hastings.—A communication was received by the Tramways Committee from the engineers to the tramways company showing plans of proposed extensions to passing places which the company wished to make, also requesting the sanction of the Corporation to the erection of one additional passing place. The Town Council consented to shifting of the passing places to the proposed new positions, but not to any increase in the length of double track. As regards the additional passing place, the Corporation were prepared to sanction it only on condition that certain constructional modifications were made.

Newcastle.—A special meeting of the Council will be held on Wednesday, Dec. 6, for the purpose of considering a resolution to apply to the Board of Trade for borrowing powers for the purpose of constructing and working by electricity a double line of tramway along the new extension of Market-street from Pilgrim-street to New Bridge street, commencing by the junction with the existing tramways in Market-street, at a point where Market-street joins Pilgrim-street, and terminating by a junction with the existing tramways in New Bridge-street at the point where the new extension of Market-street joins New Bridge-street.

Underground Electric Railway.—At Kensington Police Court last week this company was fined £10 and costs for permitting dense black smoke to issue from the generating station chimneys in Lots-road. For the Chelsea Borough Council a prohibition order was pressed for, but the company said this might compel a stoppage of the electric trains and greatly inconvenience the public. Everything possible was being done to mitigate the smoke nuisance. Mr. Douglas Carce, of Cheyne-walk, architect, said the smuts from the chimneys were as large as one's thumb-nails. The smoke was a discomfort to the whole of the residents in the neighbourhood.

West Ham.—In laying the foundation-stone of the new electric tramcar depôt at Plaistow on Friday last, the Mayor of West Ham (Alderman John Byford) remarked that for the year ended Sept. 30 the tramways earned £47,000, and it was fairly certain that for the second year's working of the undertaking ending March, 1906, the receipts would reach the fine total of £100,000, and that nearly 30 million passengers would be carried. He considered that in the municipal tramways they had an undertaking which had been and was administered on thoroughly commercial lines, as was evident by the most gratifying net profit of over £10,000 on the first year's working.

Leith.—The Corporation electric tramways were formally opened on Friday last. The cars have already been running over three important sections since August last, whilst the work on the Bernard-street swingbridge section is not completed. In addressing a crowd on the route, the Lord Provost stated that the whole system ought to be running in the following week. Owing to the demand that was made at the ward meetings for ½d. fares, he stated that 14 ½d. fares on all

Digitized by Google

parts of the system would come into force on Monday. There would also be a 1½d. fare from Bernard-street, Seafield, Bonnington, and the Caledonian Station in Commercial-street to Hanover-street and the Tron Church.

Dunfermline.—A conference took place last week between representatives of the West of Fife Tramways Co. and the Streets and Drainage Committee of Dunfermline Town Council. The intention of the company is to construct a line, starting from the new library at Townhill and running down Townhill-road, along East Port-street and High-street, on to Milesmark. Various minor matters which were raised were amicably adjusted, and on behalf of the company it was agreed that the line should be double where the Council deemed that that was expedient. The only point on which there was serious difference of opinion was regarding the amount of wayleave, on which there is also negotiation with the District Committee, and consideration of this matter was adjourned.

Sheffield.—An electric tramcar, while descending a steep incline, got beyond the control of the driver, and had its front platform smashed, together with the spindle controlling the brakes. The motorman and a passenger were injured. In the opinion of the former the accident was due to the greasy state of the rails, which caused the car to plunge forward. The available brake power did not enable him to pull up the car in time to avoid a collision, and the slipper brake which the conductor in the rear applied was, under the circumstances, not strong enough to stop the car. Until the car had been removed arrangements were made to conduct the service on a single line between Norwood-road and Skinnerthorpe-road, and there was little interference with the ordinary traffic.

Tramways over the Bridges.—We gave last week a list of conditions which the Bridges and Houses Committee recommended the Court of Common Council to impose upon the London County Council as the basis of an understanding between these two bodies relative to the running of trams over the bridges. The Council, by a large majority, adopted the recommendation. A well-attended town's meeting was held last Friday night at the Camberwell Baths, when a resolution in favour of promoting a Bill permitting overbridge tramways was carried unanimously. The committee are losing no time in proceeding with the preparation of a Bill for the running of tramways over the bridges. It has been decided to seek the advice of Sir Benjamin Baker as to whether Blackfriars Bridge should be widened on the east or west side.

Liverpool.—While attempting to replace an electric tramcar which had left the line, a tramway inspector had the misfortune to break a leg by being jammed in between two cars. At a meeting of the City Council yesterday the following motions were tabled for consideration: That children between the ages of three and twelve travelling on the tramcars be charged half fare, and those under three being admitted without charge; that the fare on the Pierhead to Cabbage Hall route be reduced to 1d.; that a 1½d. fare be inaugurated from the Pierhead to the corner of Green-lane, Tuebrook; that a ½d. fare be inaugurated for passengers travelling along Green-lane only; and that the Tramways Committee be instructed to have prepared and laid before the Council, within a period of three months, a scheme of superannuation which may be joined by the whole of the employés under their control.

Bournemouth.—In reply to a memorial presented to the Council complaining of the annoyance caused by the substitution of Poole cars for those generally in use, it was pointed out that old cars would be restored after being repaired and renovated. The Council have applied to the electricity supply company for an increase of power on the line between the County Gates and Poole. A sub-committee are inquiring into the question of tram fares. The municipal elections were fought on the question of running the Corporation electric trams on Sundays, and the results of the polling in eight contested wards showed that six candidates in favour of a Sunday service have been returned and two against. Three retiring members objecting to Sunday trams were returned unopposed. The votes in the working-class districts show large majorities in favour of Sunday running, while the polls in the better-class districts give a preponderance of votes against. There is a large majority against Sunday trams on the Town Council.

Croydon.—Lieut.-Colonel von Donop, one of the Board of Trade inspectors, recently paid a visit to Croydon, and went to South Norwood, where he inspected the newly-laid line from the bottom of South Norwood-hill and over Goat House Bridge to the Penge boundary. For the purposes of this inspection the use of a tramcar was necessary in order that it might be driven over the section. Accordingly, on behalf of Croydon Council, application was made to the secretary of the British Electric Traction Co. for the loan of a car. For some reason or other there was delay in the matter of lending a car, the secretary suggesting the necessity of a reference to the directors, and with a view to the need of saving any loss of time the Corporation officials approached West Ham Council, explained the circumstances, and were readily lent a car, which, on Wednesday, was brought by a steam-engine on a trolley to South Norwood. It was used for the purposes of the inspection. This new section of the tramway system must be completed and taken over before Nov. 30 if the company is to hand over the further sum of £3,000 according to agreement, for that day is the last upon which the Croydon County Council can give notice to the British Electric Traction Co. for the termination of their lease in May next, and this section must be handed over before its inclusion in the lease and the notice.

Belfast.—It is reported that efforts are being made by the contractors, Messrs. J. G. White and Co., to complete the conversion of the city tramway system from horse to electric traction, and it is now expected that the system will be in full working order before the end of this month. Preliminary tests have already been made with one of the two new engines—1,000-kw. triple-expansion steam dynamos by Messrs. Fairbairn, Lawson, Combe, Barbour, Belfast—and further final tests will be made immediately. The boilers are now completed, and the greater portion of the switchgear is finished. The coal-conveying plant inside the power station is almost complete, but there is a good deal of outside work yet to be done. This work, however, will not interfere with the generating machinery, which will be ready when the permanent way is complete. Some interesting figures have been compiled showing the cost of the Belfast tramways up to the 16th ult., and the position of the Corporation with regard to the loan of a million sterling raised for the purpose of buying out the old company and electrifying the lines. The purchase of the undertaking, including compensation to directors and officers (£7,500) and stamp duty on the purchase money, required a sum of £307,878. 19s. 6d. Altogether the sum paid on account of the tramway system up to the date specified is £767,563. 19s. 5d. Against that £9,408 has been received for a portion of the old rails, leaving the net sum expended £758,155. 13s. 1d. Since the date named further payments amounting to some £60,000 have been made.

London Transit.—So far as can be ascertained, few Bills dealing with the extension of transit facilities in London are likely to be promoted in the forthcoming session of Parliament. Notices of a number of schemes have been drawn up, but in view of the uncertainty which prevails with regard to the intentions of the Government respecting the report of the Royal Commission on London Traffic, promoters are disinclined to proceed with the Bills. It was hoped that some statement indicating the attitude which the Government might adopt towards the recommendations of the Commission would have been forthcoming from a Minister in time to permit of notices being lodged on Nov. 15, but this is now regarded as being out of the question, and the general feeling is to postpone further action. Amongst the schemes which are likely to be "hung up" for the present are the following: (1) a new "tube," promoted by the Yerkes group, from Hammersmith to the City, going under the Strand *en route*; (2) the Hammersmith, City, and North-East "tube"; (3) extension of the Central London Railway to Liverpool-street, and a new line by way of the Strand and Piccadilly to Hammersmith and Shepherd's Bush. We understand that the only application which the Underground Electric Railway Co., of which Mr. Yerkes is the head, intends to make is for a deviation of the proposed extension of the Baker-street and Waterloo "tube" to Edgware-road and Paddington. The London County Council proposes to seek powers for important developments of its tramway system, and the London United Electric Co. will probably also promote a Bill. It is probable that the Baker-street and Waterloo Railway will be opened in March. The first train was run from the London-road depôt to Baker-street and back recently. Mr. Chapman (engineer to Mr. Yerkes) and Mr. Manley travelled by it, and the working gave every satisfaction. The carriages are being delivered up to contract time.

Edinburgh.—The violent jerking to which passengers on the cable cars have been long accustomed resulted in a serious accident on the Portobello route. A gentleman standing near the platform was precipitated into the street and rendered unconscious. A special meeting of Edinburgh Town Council was held last week for the purpose of considering the town clerk's report on the tramways policy (which we commented upon last week), and give instructions as to tramway extensions and other matters to be included in the provisional order in the ensuing session of Parliament. The Town Clerk at the outset made a statement on the question, and pointed out that of the total expenditure on tramway matters, amounting to £1,350,000, which he detailed, the only item that would require to be renewed was the machinery. Further, he defended the Corporation against the charge of undue delay which had been made against them in the construction of the system. It was resolved that the Corporation should be the owners, or potential owners, under option to purchase, of all the tramways within the city, and should from time to time make such extensions and new lines within the city as they consider to be required for the public convenience. Resolutions that the Tramway Committee should confer with Leith Council and the Mid-Lothian County Council in view of joint action over any provisional orders for tramways at or near the boundaries of the city, and to report; and that all public tramways in the county outside the city boundaries but within a reasonable distance thereof being the property, or the potential property, of the Corporation, were referred to a special committee. The Town Clerk then explained that they had in their provisional order the Gilmore-place tramway, which ran outside their boundary, and to that extent, though it was insignificant, it was affected by the question of policy they had been discussing. This line was proposed to run out to the hydropathic and return by Fountainbridge to Tolloross. Then there was the Broughton-street and East Claremont-street line. At this point it was not necessary to make up their mind which system they would adopt, but they would have to do it before July. Certain companies were offering to lay down their underground systems at their own risk and cost. There was nothing going into their Bill about the Queensferry tramways, but there was an application from the same company that came before them last year, who were proposing to go to the Board of Trade for an order to go from Queensferry to Comely Bank, and, in addition, a line from Davidson's Mains along Ferry-road to Golden Acre. They asked an agreement on similar lines to the last. He thought they were not in a position to answer that. In the same way they had to consider a suggestion from Leith Council about a line from Pilrig-street by Bonnington along the Ferry-road to Golden Acre and Granton. That also, he suggested, should go to the committee to be dealt with in conference with parties. There were proposals for a tramway by Dalkeith-road and Duddingston to Portobello, a Murrayfield tramway, and a tramway from Leith to Portobello. All these would go down as a matter of course to the committee, and it would be the duty of the committee, in reporting on these schemes, to deal with everyone of them. There was no time now to put them into the Bill.

Digitized by Google

London County Council.—At Tuesday's meeting of the County Council the Highways Committee again submitted their recommendation for expending £415,600 on track work, including rails, and £250,000 on rolling-stock, cables, ducts, machinery, plant, etc. In consequence of the reconstruction for electric traction of the tramways in Woolwich-road, the present service of horse cars must be curtailed, and a rearrangement of fares is proposed. The Highways Committee propose that the resolutions of Aug. 1, 1905, and Oct. 17, 1905, to seek authority in the session of Parliament of 1906 for the construction of such of the new tramways authorised by the London County Tramways Act, 1900, the power in respect of which have not been exercised, and for the construction of certain new tramways, be rescinded, so far as regards the three undermentioned schemes: (1) from Cannonbury-road, *via* St. Paul's-road, to Ball's Pond-road; (2) from the existing tramways in Cassland-road to a point near Victoria Park; (3) from Aldgate (existing lines), *via* the Tower Bridge northern approach, to a point near the Tower Bridge. It is further proposed that expenditure on capital account not exceeding £1,750 be sanctioned to cover the cost of acquiring freehold of the property in Poplar for the erection of car-sheds. The Highways Committee will next week recommend that the tender of Messrs. W. T. Glover and Co., amounting to £37,860, for the supply of low-tension electric cables, feeder pillars, etc., for the tramways, be accepted. With regard to the type of car to be used in connection with the tramway subway from Southampton-row to the Strand, the Highways Committee recommend that the Board of Trade be asked to amend regulation No. 2, made by it under the London County Tramways (Electrical Power) Act, and by-law No. 3 made by it under the London County Tramways Act, 1896, so as to enable trailers to be used in connection with the single-deck cars on the Council's tramways, and for the trailers to be used by passengers wishing to smoke. The question of the several car-sheds on the north and south sides of the Thames has been under consideration, and the committee propose that application be made to Parliament in the session of 1906 for authority to make unrestricted use of sites to be acquired in various districts for the erection of tramway buildings. It is further proposed that authority be sought in the session of Parliament of 1906 to enable the Council to make such alterations in the route of the subway authorised by the London County Council (Subways and Tramways) Act, 1902, and to acquire such further property as may be necessary, to enable a station to be constructed in the subway immediately to the south of the Strand, under Wellington-street; and that the usual practice be adopted of inserting in the Bill to authorise such works a clause to provide that improvements made in lands or premises after Nov. 7, 1905, when the scheme was made public, shall not be taken into account in assessing compensation if such improvements be made with a view to obtaining or increasing the compensation payable by the Council. A joint deputation from Forest Hill and Sydenham ratepayers and the Lewisham Borough Council waited upon the Highways Committee of the London County Council for the purpose of urging the adoption of a scheme to extend the tramways route already adopted by the London County Council from Camberwell to Forest Hill Station, through Dartmouth-road, Forest Hill, High-street, Sydenham, Kirkdale, Sydenham-road, Bell-green, and on to the existing tramways at Catford, the proposed route passing within five minutes of the Crystal Palace grounds. The scheme of tramway electrification from Westminster Bridge to Wandsworth on the lower route (*via* Nine Elms-road and Battersea Park-road, and thence to Earlsfield and Tooting, has been commenced. Up to the present there has been no tram communication between Wandsworth High-street, where the new car terminus will be established, and Tooting, a distance of three miles. Electric cars are running between Tooting and the "three bridges." The new link will form an important communication between South and South-West London. The scheme is a costly one, the Council having had to acquire immense blocks of shop and house property to straighten and widen the thoroughfares, and the electrification alone will involve an expenditure of £126,000. The Council offer many sites of building land on lease. When the scheme in hand is completed, the electrification of the higher, or Wandsworth-road, route will be commenced. That will cost over £90,000.

LIGHTING AND GENERAL.

Barton-upon-Irwell.—The Rural District Council intend to apply for an electric lighting provisional order.

Brechin.—An electrical exhibition has been held under the auspices of the North of Scotland Electric Power Co. in the Corono Hall.

Darlington.—The question of altering the scale of charges for the supply of electrical energy for power purposes is being considered.

Birstall.—An inquiry has been held into an electric light scheme. It is contemplated to obtain the current from the Yorkshire Power Co.

Oulton.—The Street-Lighting Sub-Committee have arranged with the Oulton Broad Electric Co. as to the placing of the necessary street lamps.

Wellingborough.—The Highway and Lighting Committee are making progress with regard to a scheme for electric light works, electric lighting, and refuse destructor.

Durham.—At Wednesday's meeting of the County Council a report in favour of a county electricity scheme was submitted, and it was decided to withdraw the same for the present.

Wealdstone.—The District Council have decided to oppose the application for a provisional order for electric lighting of the North Metropolitan Electrical Power Distribution Co.

Amazon Telegraph Co.—The accounts for the year ended June 30 show a net profit, after providing for interest charges and the service of the debentures, of £9,836, reducing the debit balance brought forward to £78,235.

Rhymney.—A request to support a private company for the distribution of electric light in the district has been deferred for the legal opinion of the clerk, who is to report how far such action would involve the Council.

Halifax.—The Special Sewerage Committee have been instructed to go into the question of having the electricity station at Milner Royd combined with the refuse destructor, including provision of pumps for dealing with the sewage.

Stepney.—The Council have invested £1,500, part of the reserve fund of the electricity undertaking, in Lancashire and Yorkshire Railway 4 per cent. preference stock a security calculated to give a return of 3½ per cent. on the money invested.

Aston.—The total number of Board of Trade units sold during quarter ending Sept. 30 was—for lighting, 63,767; power, 71,527; traction, 227 150. In the corresponding quarter of last year the figures were: 42,187, 37,755, and 107,220 respectively.

Liversedge.—The District Council have decided to call in one of the engineers of the Yorkshire Electric Power Co. to advise them on the question of laying mains in a certain part of the district, which has been scheduled under an agreement with the company.

Elstree.—A letter from the Barnet District Council, asking for the opinion of the Elstree Parish Council upon a scheme of the North Metropolitan Electric Co. for the extension of its supply from Arkley to Elstree, will come before the next meeting of parishioners.

Eltradion Athletic Club.—A Bohemian concert will be held at the University Tavern, Chenies-street, Tottenham Court-road, on Nov. 11 at 8 p.m. The chair will be taken by Mr. A. Ewer, president, assisted by Alderman Dan Hennessy, St. Pancras Borough Council.

Wishaw.—An electric lighting installation was formally switched on last week. The cost of the scheme to the burgh is about £10 000, and the price charged to consumers is 3½d. per unit. The supply is taken from the Clyde Valley Co.'s new power station at Motherwell.

Rochdale.—It appears that the site of the electricity sub-station which is being erected at Littleborough for tramway purposes is waterlogged, and, on the recommendation of the borough surveyor, it has been decided to put down a concrete waterproof bed at a cost of about £50.

Kingsway Lighting.—We note that the Holborn Town Council have declined an offer from the Metropolitan Electric Supply Co. to erect and supply with energy free of charge for six months two electric arc lamps at the junction of Kingsway with High Holborn and in Southampton-row opposite Fisher-street.

Hackney.—With regard to the accounts published in our last issue, we desire to correct an item in the revenue account, where energy supplied to refuse destructor is stated as £3,450. 5s. 3d. This should read: "Energy supplied for power purposes—private supply, £2,799. 9s. 9d.; destructor, £650. 15s. 6d.—total, £3,450. 5s. 3d."

Llangollen.—The Council have adopted the tender of the Llangollen Electric Lighting Co. to extend the present system of electric lighting in the centre of Llangollen, and to incorporate the whole of the urban area. Powerful electric lamps will be affixed for wide thoroughfares, and smaller lights in the narrow streets will be attached to the existing gas standards.

Amalgamation.—The firms of Messrs. Arthur Koppel, of 27, Clement's-lane, London, E.C., and Messrs. Orenstein and Koppel, Bush-lane, Cannon-street, E.C., have amalgamated, and henceforth the combined business of the two firms in the United Kingdom, which represents a capital of £1,100,000, will be carried on by Messrs. Arthur Koppel at 27, Clement's-lane, London, E.C.

Ventilator Flaps.—It often happens that the openings made for ventilators have no closure arrangement. The inconveniences arising from this are removed by the "automatic closing flap for ventilators" which has been put on the market by Messrs. Mestern and Co., Nachf, Berlin, S.O. 26, Oranienstrasse 6. The flap, which is transparent, can be easily fixed, and opens and closes automatically.

Exeter.—The mayor (Mr. E. C. Perry), supported by the mayoress and several members of the Corporation and officials, on Wednesday opened an exhibition arranged by the Electric Lighting Committee of the Corporation in the Victoria Hall to demonstrate the advantages of electricity for heating, lighting, and cooking, the arrangements being superintended by Mr. H. D. Munro, city electrical engineer.

Electric Tramways and Omnibus Company of Bordeaux.—The Compagnie Française des Tramways Electriques et Omnibus de Bordeaux announce that a dividend for the half-year ended June 30, 1905, will become payable on Nov. 15, 1905, as follows: 3s. 9d. on registered shares, by endorsement on the certificate; 3s. 6d. on bearer shares, against coupon No. 8, at the current rate of exchange of the day.

East Molesey.—The Twickenham and Teddington Electric Supply Co. are now making good progress in laying their cables, but are applying to the Urban District Council for consent to the exclusion of some of the roads they originally intended to cable. A site has been selected for a transformer station. It is intended to bring the cables across the river in troughs suspended under the footpath of the bridge, subject, of course, to the consent of the County Council on either side.

Wrexham.—The borough electrical engineer's last report gives the following details: total consumption during the month of September, 41,886 units; new consumers connected, three; additions to connections, 250 8 c.p. lamps; total number of consumers, 191; total private supply, 14 070 8-c.p. lamps. The Great Central Railway Co. and the Great Western Railway Co. have been asked to delegate their respective engineers to discuss the question of supply of current and charges.

Dublin.—The necessary enlargement of the Mansion House sub-station will be carried out by the Corporation staff under the direction

Digitized by Google

of the city architect. A list of the tenders appears in another column. The Lighting Committee are thoroughly satisfied so far with the manner in which the tenders have worked out in comparison with the estimates. The Council last week received a deputation from the Dollymount Improvement Association urging the electric lighting of the Clontarf district.

Surveying and Drawing Instruments.—Messrs. W. F. Stanley and Co., 4 and 5, Great Turnstile, Holborn, W.C., have just issued a new edition of their catalogue, which has been much improved and enlarged. The last edition contained 80 pages only, the new list makes a handsome volume of 148 pages. The firm, whose goods are too well known to need description, is expanding also. Now they have passed their jubilee, they have succeeded in obtaining 286, High Holborn, adjoining their works, and have transferred their sale-rooms to that address.

London Gazette.—The partnership between James Mellanby Morrish and Ernest Tumber, electrical engineers etc., 26, Linthorpe-road, Middlesbrough, Yorks, has been dissolved by mutual consent. William Evans, King-street, Newcastle, Staffs, has been released from trusteeship in the estate of Harry Cooke, electrical engineer, 102, Buccleuch-road, Normacot, Longton, Staffs. The partnership between George Alfred Rowland and William Robinson, carrying on business as electrical engineers at the Falcon Works, Virginia-street, Southport, under the style of the Virginia Electric Co., has been dissolved by mutual consent.

Stock Exchange.—The Stock Exchange Committee have appointed Nov. 22 special settling day for Johnston and Phillips's 6,635 ordinary shares of £1 each, fully paid, Nos. 1 to 6,635, and £116,667 5 per cent. first mortgage debenture stock; and have ordered the Indian Electric Supply and Traction Co.'s partly-paid provisional certificates for £120 500 6 per cent. construction debenture stock to be quoted in the official list. Application has been made to the committee to allow Amazon Telegraph Co.'s further issue of £35 900 5 per cent. debentures of £100 each, Nos. 1,251 to 1,609, to be quoted in the official list.

Telephone Kiosks.—The National Telephone Co. on Wednesday applied to the Holborn Council for permission to erect additional kiosks for call offices in suitable spots in streets under the control of the Council. At present there are four such kiosks in the borough, for which the company pay an annual rental of £15 each kiosk. This payment is considered quite inadequate, and we understand that permission has only been granted in one case at an annual rent of £30, and that the rental of the existing kiosks in the borough will be increased from £15 to £30 per annum each, at the conclusion of the current rental year."

Heckmondwike.—The report for month ending Oct. 31, 1905, contains the following figures: units generated on lighting, 1905, 41 189 (1904 25,082, increase 16,107); units generated on traction, 20,389 (16,015, 4,374); total units generated, 61,578 (41,097, 20,481); units sold—private lighting 8 431 (6 568 1,863), street-lighting 7,527 (7,064, 463), power 16 188 (2 631 13 557), traction 17,407 (15,247, 2 160); total units sold, 49,553 (31 510 18 043); units used on works, 5,833 (4 378, 1,445); total units accounted for, 55,376 (35,888, 19,488); station efficiency, 90 per cent. (87·3 per cent.); battery efficiency, 75 per cent. (71 per cent.); number of consumers, 199 (159, 40); equivalent 8-c.p. lamps connected, 22,913 (14,085, 8,828); maximum load on plant in kilowatts, 437 (257, 180); maximum load on feeders in kilowatts, 569 (244, 325).

Victoria Falls.—A Reuter's telegram states that the African Concessions Syndicate has been in consultation with the leading American and Continental engineers and experts on the subject of the transmission of power from the Victoria Falls to the Witwatersrand. These authorities have unanimously expressed the opinion that the scheme is not only quite feasible but would be commercially successful, especially as the climate of South Africa is one of the most suitable in the world for the transmission of power. There is no ice in the rivers to interfere with the working of the turbines, and no snow to break down the transmission lines. The extreme dryness of the climate is also greatly in favour of the project. The experts consider that there is absolutely no difficulty in the way of the scheme so far as the distance of transmission is concerned.

Birmingham.—The Nechells destructor was opened on Tuesday, and the electric transmission system in connection with the sewage farm at Tyburn was inaugurated. In 1901 the city of Birmingham obtained from the Tame and Rea Drainage Board two acres of land at Saltley for £400 per acre. The Drainage Board agreed to build and equip the boiler-house and to pay 10s. per horse-power per annum. By obtaining steam from the destructor the Board could dispense with five portable engines and pumps, two gas-engines, and certain farm-yard machinery, besides getting rid of gas and water bills amounting to nearly £400 per annum, and altogether they will save more than £1,000 per annum by substituting electricity for steam. Mr. Watson prepared the plans, and the principal contractors were Messrs. Lee and Son for the whole of the buildings, £15,615; the British Thomson-Houston Co. for the whole of the electrical work, £8,314; and Messrs. Heenan and Froude for the furnaces, £4,589. The total cost of the scheme is £35,829. 2s., of which the Corporation pays £17,691. 10s. and the Drainage Board £18,137. 12s.

Gillingham.—The engineer's last report shows that the equivalent of 177 8-c.p. lamps has been connected with the mains since the last meeting of the committee, making a total of 47,268 8-c.p. lamps with 258 consumers. An estimate of cost of laying street-lighting mains, including seven columns and brackets fitted with 32-c.p. lamps, amounting to £56 and of £10 for attaching an arc lamp to the tramway standard at Victoria Bridge, has been approved. The committee are considering an application from the Kent Electric Power Co. for a reduction in the price of the bulk supply of electric current provided the company enter into a contract with the Council up to September, 1906. The committee intend to apply to the Inspector-General for the extension of their contract to the Naval Hospital for another year in consideration of the fact that the Admiralty did not commence to take electric current until 12 months after the time mentioned in the contract, and the Inspector-General's attention is to be called to the fact that the hospital is not taking the amount of current which the Council were led to suppose they would require.

City of London.—At the last meeting of the Court of Common Council, the chairman of the Streets Committee was asked whether they would consent to the withdrawal of the notices recently served on the City of London Electric Lighting Co. requiring them to remove their lamps and standards in various important streets of the City pending the result of the present experiment in incandescent gas lighting, as either proving or disproving the contention that such lighting was more efficient and satisfactory than the electric light. Mr. A. C. Morton replied that the three months' notices to remove the electric lamps in Fleet-street, Queen Victoria-street, and elsewhere were served on the company some time ago. Since then the company had appealed to the Corporation to cancel the notices, but it had declined. The committee would report carefully and impartially on the experiment now being made, and the Corporation could take any action it liked in the matter. An invitation by the London County Council to the Corporation to a conference to consider the supply of electrical energy in London on the 20th inst. was referred to a committee.

Horsham.—On Nov. 2, Mr. Lintott, as chairman of the Electric Lighting Committee, when starting a new engine at the electricity works, said that last year the undertaking had shown a profit of more than £1,000, which had paid off nearly the instalment of loan and interest. Next year he hoped they would do very much better. Mr. Morgan then supplied particulars concerning the undertaking since he took it over two and a half years ago, and expressed the opinion that in the course of a few years the undertaking would be one of the most sterling assets the town possessed. Their capital expenditure, which two years ago amounted to £13,000, had now doubled. But whereas their horse-power in machinery was then 225 it was now 711, including the new engine, and while they then had 3,800 lamps connected and 85 consumers, they had now 9,500 lamps and 260 consumers. Five miles of mains had increased to 16½ miles. The earnings had risen from £1,244 to £2,400, and the profits from £249 to more than £1,000. The new engine would give 220 h.p. continuously, if necessary, for a month or two. It took 300 gallons of water an hour and consumed 7 cwt. of coal. Against that expenditure it had an earning capacity of £2. 10s. per hour. The British Westinghouse Co. were the contractors.

Awards.—The 500-b.h.p. Diesel engine exhibited at the Liége Exhibition has been awarded the "Grand Prix." We are informed that at a recent test carried out by the purchasers of this engine, the extremely low figure of ·38lb. per brake horse-power hour was obtained for fuel consumption at full load. This, with oil at 42s. per ton, represents a cost of 0·096d. per brake horse-power hour, or 11½ brake horse-power hours for 1d. The Diesel Engine Co., of London, have recently secured an order for an engine of this power (500 b.h.p.) to drive the new extension of the works of Messrs. Craven and Speeding Bros., Sunderland, where a small Diesel engine of 240 b.h.p. has been used to drive the existing works for nearly two years. Among other contracts recently obtained, the Diesel Engine Co. report: 150 b.h.p. for Messrs. Bartram and Sons, Sunderland; 225 b.h.p. for Messrs. Binny and Co., Madras; 160 and 140 b.h.p. for Messrs. Bradbury, Brady, and Co., Bombay; 90 b.h.p. for Messrs. Gibson, Battle, and Co., Sydney; two 33-b.h.p. for the Guildford Electric Lighting Co., Australia; two 20-h.h.p. for Messrs. Haupt, Biehn, and Co., Rio de Janeiro. The Horsfall Destructor Co., of Leeds and London, have been awarded a Diploma d'Honneur in Class 3 (Hygiene) at the Liége Exhibition for their exhibit of refuse destructor plant.

Bermondsey.—At Tuesday's meeting correspondence was submitted with regard to the offers of the County of London Electric Supply Co. and London Electric Supply Corporation. The former company offered (*a*) to supply the Council with current in bulk for distribution by the Council within the area of supply at a price cheaper than it can be generated by the Council; (*b*) to take over the Council's undertaking on lease and to work same for a period of years, the company guaranteeing the Council a sum sufficient to provide sinking fund and depreciation on the capital expended. The latter proposed a meeting between their engineers and those of the Council. Both offers were declined, and in doing so the town clerk pointed out that the Electricity Committee was not aware that in any sense had a cutting policy been adopted by them, as suggested in one of the letters. The electrical engineer has been asked to bring up an estimate for condensing plant at the next Council meeting. A cooling chamber is to be constructed for cooling clinker from the destructor at a cost of £125. The consumption of current at the Bermondsey Baths for the quarter ending September, 1905, is returned as 4,206 units (868 units for light and 3,338 units for power) as against 4 208 units (889 units for light and 3,319 for power) for the corresponding period of last year.

Carlisle.—The Council have received a special report on the details of the station working as follows: "The sale of current in 1904 5 showed an increase upon that of 1903 4, but the result of last year's working gives an actual loss of about £400, excluding, of course, the amounts due for interest and sinking instalments upon the increased capital account. It is unfortunate that just as these increased payments had to be met we were faced by an abnormal expenditure, payable out of revenue, for maintenance and repairs, a series of accidents to the plant costing a large sum in the aggregate. The sub-committee are assured by Mr. Burnet that the engines and plant are now in a thoroughly good condition, and that he has every reason to hope that there will be a very substantial reduction in the cost of maintenance and repairs in 1905 6. Every care will be taken to keep down expenditure, and taking into account that the engines and electrical plant are now insured, and charges which last year had to come out of revenue will

Digitized by Google

now be recoverable, there is reason to believe that the result of this year's working will be very much better. It should be noted that up to last year the yearly deficit has been steadily reduced year by year, the loss upon 1903-4 being nominal. Last year the new capital charge created extra interest and sinking instalments, but your committee hope that this will also be rapidly reduced in view of the continued applications for current."

Dundee.—The Tay Ferries Committee have decided to light the Craig Pier by electricity. The estimate for overhead wiring is £80. A remit has been made to the engineer to place the contract. The last report of Mr. O. F. Francis, the engineer, on the electric light department, shows that 26 new consumers were connected between May 15 and Sept. 30, or an average of 5·8 per month, and applications were being continually received from old consumers for additional lighting. The units sold this term, as compared with the same period last year, were: private lighting—1905, 17,100; 1904, 11,326—increase, 5,772; private motors—1905, 28,100; 1904, 9,327—increase, 18,773; total—1905, 45,208; 1904, 20,653—increase, 24,545. The increase in lighting units was very satisfactory, and if it continued during the remainder of the year, the income to the undertaking would be increased by at least £40 more than what was anticipated in the estimates. The working costs show a satisfactory decrease over the same period last year, and he anticipated that they would be as low, or lower, for the current year as those obtained in any similar sized town in its third year of working. The engineer says that on the whole the electric lighting department is in a very satisfactory position, and he believed that, instead of a deficit of £397, which was estimated last May for the current year, they would be able to show a net profit after paying a final balance of £517 for the costs and order, and next year they would be able to so reduce the cost of current to the tramways as to practically cover the expenditure on them.

Swanage.—The Council have approved of a report in regard to a scheme to be promoted by the Bournemouth and District Electricity Supply Co. for obtaining powers to supply electric lighting within the parish of Swanage. The company stipulate that the provisional order should provide that the Council should have power to purchase after 21 years from the date of confirmation of the order, allowance being made or the goodwill of the undertaking; that the authority should have the same power at the end of 28 or 35 years from the date of the confirmation of the order; and that if the option to purchase were not exercised until after 42 years from that date, the purchase should be at a fair market value at that time, but without any addition in respect of compulsory purchase or of goodwill, or of any profits which may or might have been made from the undertaking, or any similar considerations. The maximum price of electricity supplied for lighting purposes is set out at 7d. per unit, and of electricity supplied for power purposes at 2½d. per unit. The area has been fixed, and all cables and supply wires will be laid underground, and where practicable under footpaths. Any roads or paths disturbed by the company are to be reinstated by the Council at the expense of the company—the cost to be calculated according to a schedule of prices to be agreed on. A clause is to be inserted in the provisional order providing for what is known as a "stand-by" supply in cases where householders have already an electric installation. The Council have sanctioned an agreement on these terms, reserving the right to make any other stipulations or conditions which may appear necessary after the draft provisional order has been received and considered.

Battersea.—The Lighting Committee reported at Wednesday's meeting receipt of a letter from the London County Council with reference to fires caused by short-circuits on cables, stating that they do not consider it necessary that immediate notification of all fires occurring in the borough should be given to the electricity department, but that it is the practice of the fire brigade to notify the Battersea electricity department without delay of any fires due to electricity or involving electric cables or apparatus that may occur in the borough. Two representatives were appointed to attend a conference at the County Hall on Nov. 20 in reference to the question of the supply of electricity in bulk. The accounts of the electricity undertaking during the year ended March 31 last show a great advance, and that after deducting all expenses a profit of £294. 17s. 10d. has been made. There has been a considerable increase in the demand for electrical energy both for lighting and motive purposes, and a material saving in the cost of working. When it is remembered that the repayment of the loans, which was suspended for three years, began during the year in question, causing an increase in payments of £3,500, the results achieved are very gratifying. In connection with the accounts, the committee have considered a letter from the London County Council suggesting the establishment of a reserve or renewal fund in re electric lighting undertaking, and they recommended that the County Council should be informed that whilst this Council are in favour of the views expressed in their letter, they do not see their way to carry out the wishes of the County Council at this stage. The amount received for meter rents during the past year has been £62. 14s. 10d., as against the total receipts of £23 698. 6s 9d., and having regard to the disproportion in the receipts for meters and the total receipts, and in consequence of complaints received, the charges for meter rents are to be abolished after the Michaelmas quarter readings of the meters have been taken.

Hammersmith.—The annual report of the borough electrical engineer upon the working of this department for the year ending March 31, 1905, states that during the year 320 consumers were connected and 212 disconnected, and there are now 1,577 consumers taking current from the mains, a net increase of 108 over the previous year. This increase is not quite so large as usual, the increase in equivalent 8-c.p. lamps connected being 6,859. The units sold per 8-c.p. lamp connected have increased from 26 for the 12 months ending March, 1904, to 32 for the year under review. During the year 2,948,633 units were sold, or 724,710 more than the previous 12 months, this increase being nearly double that mentioned in my last year's report. Of the extra units sold 414,601 were used for power purposes; 146,175 were used for public lighting; 163,934 were used for private lighting. The maximum demand upon the generating station has risen from 1,596 kw. to 2,246 kw., which occurred during the period of the motorcar exhibition at Olympia. It is interesting to note that this maximum demand is equivalent to the total output of all the plant installed at the generating station, thus showing that the plant has been well maintained so as to be able to meet this demand. The question of efficiency of generation by means of this plant is another matter. The ordinary maximum demand upon the station—*i.e.*, excluding the period of the motorcar exhibition—was 2 068 kw., an increase of 472 kw. over the previous year. The average price per unit sold for private supply is still decreasing, being only 2·94d., against 3 43d. for the previous 12 months, a decrease of practically ½d. per unit. This is caused by the reductions obtained by several of the largest consumers under special contracts, and the extra consumption which these rates induced. The use of electricity for power purposes has considerably advanced in Hammersmith, and there are now 180 motors of 1,207 h.p. connected to the circuits, an increase of 289 h.p. on last year's figures. This increase is doubtless owing to the low price at which current is now supplied for power. It is interesting to note that the output of current used for power purposes for the year ending March, 1904 was 611,049 units, whereas for the year ending March 31, 1905, this figure has increased to 1,032,871 units. The charges for current remain the same as during the previous year, but after September, 1905, the charge for current used for lighting will be reduced to a uniform rate of 3d. per unit. It is anticipated that this reduction will induce a large number of residents to adopt electricity for lighting purposes, and it is already having the desired effect, as several of the present consumers have intimated their intention to extend their installations. The statement of units generated and sold is as follows: quantity generated in Board of Trade units, 3,456,570; sold—public lamps 472,906, private consumers 2,475,727—total, 2 948,633; quantity used on works, 456 306; total quantity accounted for, 3,404,939; quantity not accounted for, 51,631; number of public lamps, 223 arcs and 63 Lofcus; total maximum supply demanded, 2,426 kw. In conclusion, Mr. Bell mentions that the year in question has been the most successful since the commencement of the undertaking. The expenditure has been actually less than for the year ending March, 1904 whilst the revenue has increased by about £3 000. The net result is a profit of £5,282 on the year's working, which has been arrived at by improved and economical working of the plant.

London County Council.—On Tuesday tenders were opened for the supply and delivery of steel conductor tee rails required in connection with the reconstruction of certain of the Council's tramways north of the Thames. These were referred to the committee concerned. It was agreed to lend the Hammersmith Borough Council £13,700 for electric light installation. Sanction to borrow £991 for electric light installations and street lighting was given to the Woolwich Borough Council. The following important report was submitted by the Finance Committee with regard to the Fulham loan noted in our last issue: "We submitted on Oct. 31, 1905, a recommendation that a loan of £25 000 should be advanced to the Fulham Metropolitan Borough Council for electric light installation, but the Council postponed for one week the consideration of our recommendation. In our report we stated that, in view of the uncertainty as to the method of generating electrical energy in London in future, we should have preferred that large works of extension of generating plant should not be undertaken by the borough councils at the present time, but that, having regard to the fact that the work which formed the subject of the application had been commenced, we thought the loan should be granted. In support of the adoption of our recommendation without delay, we would state that we understand that the plant already installed is only just sufficient to supply the estimated maximum demand during the coming winter, and it, therefore, appears necessary that an immediate addition shall be made to the existing generating plant. Under these circumstances we do not think that the Council should refuse to sanction the loan now under consideration. We may state that the proposal to supply to distributing authorities of electricity in bulk is receiving our careful consideration in connection with applications from local authorities for loans for electric lighting purposes. Should the Council decide to grant the loan it would be convenient for it to be advanced without delay. We have, therefore, included the amount in the list of proposed payments, and submit a recommendation as to the sealing of the order sanctioning the borrowing. The adoption of the recommendation will not, of course, be moved unless the Council decides to grant the loan. We recommend that the seal of the Council be affixed to an order (in duplicate) sanctioning the borrowing by the Council of the metropolitan borough of Fulham of the sum of £25,000 for the installation of the electric light within the borough, repayment to be made within a period of 42 years." This was agreed to after discussion. The Highways Committee reported that Messrs. J. Westwood and Co., who had in accordance with the resolution of July 28, 1903, erected the steelwork required in connection with the first portion of the Greenwich electricity generating station, had rendered themselves liable under the provisions of their contract to deduction by way of liquidated damages in respect of delay in the completion of the work. The contract price was £36,808. 14s. 6d., and, after making allowances for causes not within the control of the contractors, it was computed that the Council might claim as damages a sum of £2,500 in all. Having very carefully considered the matter, they had arrived at the conclusion that, in view of all the circumstances, a fair arrangement would be for the Council to retain a portion only of the £2 500 above referred to in respect of the delay occasioned. They suggested, therefore, that £500 of the

Digitized by Google

£2,500 should be retained, and recommended accordingly. In connection with the construction or reconstruction of the New Cross to Rushey Green tramways, the Battersea and Wandsworth lines, and the Vauxhall Bridge-road, etc., tramways, it will be necessary to supplement the switchgear at the existing sub-stations from which the lines will be worked. For this purpose additional low-tension feeder panels are to be provided at a cost of £850 at the New Cross, Elephant and Castle, and Brixton sub-stations. Notices of intention to lay low-tension mains from the County of London Supply Co. in Green-lane and from the London Electric Supply Co. across Westminster Bridge were approved. Similar notices from the St. Pancras and Islington Borough Councils were also received.

PROVISIONAL PATENTS, 1905.

Oct. 30.

22037. Electric switch (two-way or more) for motor cycles, cars, stationary combustion engines, and the like. William Andrew Ewbank and Frederick William Barnes, 91, Moor-street, Earlsdon, Coventry.

22061. Improvements in and connected with folding up telephone stations. Hermann Oppenheimer, 55, Redcross-street, Barbican, London. (Aktien-Ges. Mix und Genest, Germany.)

22086. Improved candlestick which can also be used for electric lighting. Ernest Brown, 55, Lant-street, London.

22088. Improvements in or connected with lifeguards on tramway vehicles either in combination with sanding gear, magnetic or rheostatic brakes, or independently thereof. Mark Cummins, 8, Peel-terrace, Chester-road, Old Trafford, Manchester.

22119. Improved method of controlling lifts electrically. Edmond Meyer Tudor Boddam, 23, Savernake-road, London.

22121. Improvements in actuating devices for magneto-ignition apparatus. Magnetzünder-Gesellschaft Unterberg und Cie., 322, High Holborn, London. (Date applied for under Patents Act, 1901, Feb. 28, 1905, being date of application in Germany.) (Complete specification.)

22129. Improvements in or relating to alternating-current distributing systems. Arthur Francis Berry, 46, Lincoln's-inn-fields, London.

22130. Improvements in the manufacture of magnetic materials. Robert Abbott Hadfield, 46, Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, June 8, 1905, being date of application in United States. (Complete specification.)

22132. Improvements in electric arc lamps. William James Davy, 40, Chancery-lane, London.

Oct. 31.

22149. Improvements in telephone receivers. James McMillan, 65, Chancery-lane, London.

22195. Improvements in braking polyphase induction motors. Rudolf Braun, Westinghouse-building, Strand, London.

22197. Electrical safety device against burglary. Eugenia Amadea d'Urbino, 321, High Holborn, London.

22198. Improvements in contact apparatus for electrical igniters. Charles Aubrey Day, 321, High Holborn, London. (Fabrik Elektrischer Zünder, G. m. b. H., Germany.)

22231. Improvements in apparatus for controlling the supply of electrical energy from alternating-current electric generators to alternating-current electric motors. Robert Stafford McLeod, 34, Castle-street, Liverpool.

22261. Improvements in systems of electrical distribution employing rectifiers. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

22262. Improvements in alternating-current dynamo-electric machines. British Thomson-Houston Company, 83, Cannon-street, London. (The General Electric Company, United States.)

22263. Self-testing safety code for telegraphing and cabling. Charles Judge Mitchell, 8, Colborne-street, Toronto, Ontario, Canada.

Nov. 1.

22290. Improved combination gear applicable for speeds starting and lifting power and other electrical and mechanical purposes. William Henry Walter Lucy, 28, Thornton-street, Brixton, London.

22314. Improvements in or relating to the electrical production of heat for cooking and other purposes. Arthur Francis Berry, 46, Lincoln's-inn-fields, London.

22334. A method of auto-regulation for dynamo-electric generators subject to fluctuations in speed. Henry Wright, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

22343. Improvements in transformers, reactances, and the like. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

22349. Improvements in or connected with starting and driving mechanism suitable for use with gas-engines, electromotors, and other engines. Charles Baxter, 37, Essex-street, Strand, London.

22353. Improvements in or relating to electric incandescence lamps with metallic filaments. William Phillips Thompson, 322, High Holborn, London. (Deutsche Gasglühlicht Aktien-Ges. (Auergas), Germany.) (Complete specification.)

22357. An improved electric signalling system for railways. A. Gardiner, 40, Chancery-lane, London.

Nov. 2.

22404. Improvements in electric incandescent lamps. Harry King, Seymour Villa, West Bridgeford, Nottingham.

22419. An improved form of electromagnetic mechanism for giving a signal, actuating a switch or the like under certain predetermined conditions of current flow in an electric circuit or circuits. Henry Pierson, the Westinghouse Patent Bureau, Westinghouse-building, Norfolk-street, Strand, London.

22450. Improvements in electrical measuring instruments. Charles Alfred West, 18, Southampton-buildings, Chancery-lane, London.

Nov. 3.

22460. Improvements in electrodes. Mataichi Yasuda, Fife House, Kingston-on-Thames. (Date applied for under Patents Act, 1901, Jan. 21, 1905, being date of application in United States. (Complete specification.)

22472. An improvement in and relating to electric lighting. John Bolton, 2, Maygrove-road, West Hampstead, London.

22505. An improved weatherproof combined watch-holder and electric light for use on motor and other vehicles, the same being applicable for holding a speedometer, mileometer, or the like. Arthur Thomas Hawkes, 306, High Holborn, London.

22531. Apparatus for wireless transmission of telegraphic, telephonic and autographic messages by Hertzian waves. Gregorio Pansa, 7, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 4, 1904, being date of application in France.) (Complete specification.)

22544. Improvements in self-acting load resistance for the comparison or standardisation of current tension and effects. Martin Kallmann, Passauerstrasse 1, Berlin, Germany.

Nov. 4.

22578. Improvements in connection with trolley heads employed upon electrically-propelled vehicles. Maurice Paterson McLaren, 15, Hart-street, Edinburgh.

22585. Improvements in electric switches. The Electric Ignition Company, Limited, and Frederick Harold Hall, 24, Temple-row, Birmingham. (Complete specification.)

22616. An improved electrical circuit-closing device operated by the depression of the rail on railways or tramways. John Francis Dineen, 4, South-street, Finsbury, London.

22618. Improvements in and relating to apparatus for heating iridium filaments for incandescent lamps. Robert Jacob Gülcher, 231, Strand, London.

22620. Improvements in and relating to electric meters. The British Thomson-Houston Company, Limited, and Frank Holden, 83, Cannon-street, London.

22622. Improvements in electric switches. Frederick Millington and Albert Hugh Muller, 322, High Holborn, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 23.

1904.

23952. Telegraphic and other transmitting apparatus. Armstrong and Orling.

24699. Electric motor control and apparatus therefor. British Thomson-Houston Company, Limited. (General Electric Company.)

25386. Single-phase commutation electric motors. von Zweigbergk.

26290. Control of alternating-current motors and apparatus therefor. British Thomson-Houston Company, Limited. (General Electric Company.)

26391. Mechanism for use in conjunction with apparatus for utilising electromagnetic or Hertzian waves. Smith.

27683 Instruments for the measurement of wave lengths in wireless telegraphy. Fleming.

28749. Telephones for the use more particularly of divers. Lacey and Holman.

29057. Electric insulation. Meirowsky.

29065. Electric dry batteries. Butler.

29074. Metal reflectors for use with electric lanterns. Rey.

29377. Fuses for electrical circuits. Field, and Ferranti Limited.

29448. Arc lamps. Könitzer.

Digitized by Google

1905.

1563. Electrical measuring instruments. Field.

1891. Contact breakers of induction coils. Codd.

2030. Method and means for eliminating or reducing the influence of disturbing currents on telephone circuits. Jacobs.

3347. Switch apparatus for coin-freed electricity meters. Tourtel.

5149. Telephone and like transmitters Cutmore.

9991. Electric switches. Electric Ignition Company, Limited, and Hall.

11036A. Alternating-current measuring machines. Conrad and Bradshaw. (Date applied for under International Convention, May 27, 1904) (Originally included in No. 11,036, 1905.)

11036B. Alternating-current measuring instruments. Conrad and Bradshaw. (Date applied for under International Convention, May 27, 1904) (Originally included in 11,036, 1905.)

11702. Dynamo-electric machines. British Thomson-Houston Company, Limited. (General Electric Company.)

12424 Electric telegraphy. Kitsee.

13063. Electric clock and alarm systems. Rausch and Gondolf.

13093A. Electric drills. Boult. (Duntley). (Date applied for under Rule 5, Patents Rules, 1905, June 24, 1905.)

14663. Central battery telephone transmitters. Scales.

16772 Connection or electric coupling boxes for electric cranes or other electrically-operated machines Siemens Bros. and Co., Limited, and Huddleston.

20371. Apparatus for sound transmission by means of electrically-produced light and heat rays. Siemens Bros. and Co., Limited. (Siemens-Schuckertwerke G. m. b. H.)

NOTES.

The Electrical Standardising Institution.—Prof. C. A. Carus-Wilson, M.A., M.I.E.E., commenced a special course of lectures to the senior students of this institution yesterday upon "Direct-Current Motor Construction." The lectures will be delivered on every subsequent Monday and Thursday for the remainder of the term.

Northampton Institute Engineering Society.—This society has just been formed by the students connected with the Northampton Institute. The first meeting will be held on Saturday, Nov. 18, at the institute, when a paper will be read by Mr. S. M. Hills on "A Comparison between Gas and Electricity in regard to their use as illuminants." Dr. R. Mullineux Walmsley will take the chair at 7.30 p.m.

Electrical Navigation.—Experiments were recently carried out in Bilbao Harbour by Señor Torres Quevedo with a view to ascertaining the possibility of maritime navigation by means of power transmitted by Hertzian waves. The propellers of a boat were worked in the harbour by electric waves transmitted without wires. The inventor considers it feasible to apply his system to special navigation.

Junior Institution of Engineers.—As the annual dinner of the Institution of Electrical Engineers has been fixed for Friday, Dec. 8, it has been decided to postpone the reading of the paper on "Electrical Mains for Power Transmission Work," by Prof. John T. Morris, M.I.E.E., to the following Friday, Dec. 15. In connection with the paper a visit has been arranged to the works of Messrs. Johnson and Phillips at Charlton for Saturday morning, Dec. 16.

Wireless Telegraphy.—From particulars to hand relative to the working of the Marconi wireless telegraphy on the s.s. "Inkosi," whose installation with this system we announced in a previous issue, we learn that the last message reached the "Inkosi" when she was 764 miles south of the Lizard. In the opinion of the operator, however, the vessel would have been able to receive messages for another 300 miles, but circumstances made it impossible to test the apparatus quite so fully as is expected to be done in future voyages.

Milan Exhibition.—Those who wish to take advantage of the grant of £10,000 made by the British Government in aid of the British section for this exhibition are invited to make application for space and other particulars to Mr. Arthur Serena, 1 and 2, Oxford-court, Cannon-street, E.C. The commission are most anxious to secure a representative exhibit of British manufactures at the forthcoming exhibition, and are willing to afford information to manufacturers and presidents of chambers of commerce interested therein.

Dick-Kerr Engineering Society.—This society has been formed at the Preston works of Messrs. Dick, Kerr, and Co., and has for its object the discussion of engineering matters of a general character. It is hoped by means of this society to promote greater social intercourse among the members of various departments to their mutual benefit. Papers have already been read and discussed on such diversified subjects as "Tramway Tracks," "Petrol Engines," "Electric Trams *v.* Motor 'Buses," "Single-Phase Motors," and "Incandescent Electric Lamps," further papers being promised throughout the session.

Tramways and Light Railways Association.—In the *Official Circular* for November is given a list of lectures and visits for which arrangements have been made. On Nov. 23 Mr. W. L. Green will deliver a lecture on "The Paving of Roadways." A paper will be read in March, 1906, by Mr. S. Sudworth "On the Upkeep of Tramway Electric Motors," the date of which will be announced later. The Society of Motor Manufacturers and Traders have invited the members to visit the exhibition at Olympia at noon on Nov. 21. The long-deferred conference at the Board of Trade, when a joint statement was submitted by representatives of the three tramways associations, took place on Nov. 1, and a full report of this meeting will appear in due course.

Submarine Signalling.—The Cunard Steamship Company have already five of their North Atlantic steamers fitted with the submarine signalling apparatus, and we understand that the "Carmania," the largest turbine-driven steamer in the world, and the first to run between Europe and the United States, will also be possessed of an equipment. Trials have been made on board the German steamer "Deutschland," from which the bell at the Outer Weser lightship was located at a distance of five nautical miles, while the noise made by the propeller of a large passing steamer was distinctly heard at a distance of $1\frac{1}{2}$ miles, though the "Deutschland" was steaming 19 knots. This latter fact, says Lloyds, is very important, and should be of great assistance to navigation in foggy weather.

Electricity in Mines.—Higher education in mining continues to engross the attention of the Notts and Derbyshire Education Committees, the Midland Counties Institution of Engineers, and the Midland branch of the National Association of Colliery Managers, under whose collective auspices a lecture was delivered in the large theatre of Nottingham University College on Saturday last by Mr. W. C. Mountain, who, in the course of his remarks, gave a general explanation of the electrical units used in practice, formulæ for ascertaining losses in cables, current necessary for transmitting power at different voltages, a description of generating machinery suitable for colliery requirements, and of electric winding plants at present in use, illustrated by photographs of Continental and English installations, and ventilation by means of electric fans. In conclusion, he said that it would not pay to put in electric winding. The Chairman, in proposing a vote of thanks to the lecturer, said the information afforded was corroborated by a mining engineer, who stated, after going very critically into the question in Germany, he came to the conclusion that electric winding, from an economical point of view, was not adaptable to conditions here. We disagree with both of these experts, and leave the decision as to which is right for time to prove.

Electric Locomotives.—Extensive tests are being made with a view to ascertaining the relative merits of electricity and steam as motive power for railways, and the trials recently concluded in New York have conclusively determined the superiority of the former over the latter. In a competitive test an electric locomotive easily outdistanced a steam-propelled train, the load of each being equal. A New York Central locomotive, built by the General Electric Company and the American Locomotive Company, is now being tested at the Schenectady experimental track, and recently completed the first half of the 50,000-mile test to which it was subjected. The motors on the locomotive are at the present day those with which the test began; the commutators are perfectly smooth, the brushes having run the 25,000 miles with a wear of only $\frac{3}{8}$in., and appear quite capable of completing the second half of the distance. During these tests the locomotive has been in service regardless of weather, and a speed of 85 miles an hour has been indicated. The total cost of all repairs on the locomotive, excluding injury caused when

Digitized by Google

the shed in which it was housed took fire, has been slightly over £85 for the 25,000 miles, but there is every indication that the expense of the second portion of the journey will be materially reduced.

Engineering Standards Committee.—We are informed that a conference of incandescent lamp makers will be held at the Institution of Civil Engineers on Friday, Nov. 24, at 11 a.m. The subject, which is now being dealt with by the Sub-Committee on Physical Standards, presided over by Dr. Glazebrook, the director of the National Physical Laboratory, has recently come under the notice of the Incorporated Municipal Electrical Association, with the result that Mr. C. D. Taite, of Salford, and Mr. George Wilkinson, of Harrogate, have been appointed to represent the association on this committee. A circular dealing very completely with the various questions affecting the standardisation of carbon-filament incandescent lamps has lately been issued to the manufacturers, and we understand that very valuable information has been placed at the disposal of the committee. In view, however, of the many difficult questions involved, the Sub-Committee on Physical Standards have decided that before formulating any recommendations to be put before the Electrical Plant Committee for transmission to the main committee, the interests of all concerned would be best served by convening a conference, and, in a friendly manner, discussing those points which appear to be somewhat difficult from the point of view of standardisation.

Telephony.—The resolution passed at the recent Liége meetings of the Association of Chambers of Commerce in reference to proposed extensions of long-distance telephony to France and other foreign countries has evoked a reply from the Postmaster-General, in which he states that it is at present impossible to afford more extended facilities. The telephone service, he points out, is unlike the telegraph service, inasmuch as telephonic conversation is dependent upon minute variations in a small electric current; and although a double copper wire line is used in most cases, the effect of outside disturbances and the attenuation of sound is very marked when the line extends over long distances. There is, therefore, a limit beyond which it is at present impossible to carry on conversation. This limit varies according to circumstances, the presence of a section of submarine cable having a considerable effect in shortening the limit. In the case of telegraphs it is possible to use more powerful electric currents and to insert relays in the circuit, which have the effect of augmenting the current at regular distances; but neither of these alternatives is at present practicable to the same extent in telephony. Should further experiments advance the science and invention of telephony, the Post Office will readily attempt to meet the views expressed in the resolution.

Society of Arts.—We have received from the secretary a list of meetings arranged to be held during November and December, which include the following: Wednesday, Nov. 22 (ordinary meeting), F. Martin-Duncan, "The Cinematograph and its Applications"; Monday, Nov. 27, (Cantor lecture), J. A. Fleming, D.Sc., F.R.S., "The Measurement of High-Frequency Currents and Electric Waves" (Lecture I.); Wednesday, Nov. 29, (ordinary meeting), Sir William H. Preece, K.C.B, F.R.S., "The British Association in South Africa"; Monday, Dec. 4 (Cantor Lecture), J. A. Fleming, D.Sc., F.R.S., "The Measurement of High-Frequency Currents and Electric Waves" (Lecture II.); Wednesday, Dec. 6 (ordinary meeting), Sigmund Stein, "The Manufacture of Sugar from British-Grown Beet"; Thursday, Dec. 7 (Indian Section), Sir James A. Bourdillon, K.C.S.I., "The Partition of Bengal"; Monday, Dec. 11 (Cantor Lecture), J. A. Fleming, D.Sc., F.R.S., "The Measurement of High-Frequency Currents and Electric Waves" (Lecture III.); Tuesday, Dec. 12 (Applied Art Section), Louis N. Parker, 'Historical Pageants"; Wednesday, Dec. 13 (ordinary meeting), W. F. Mitchell, "The Commerce and Industries of Japan" (his Excellency the Japanese Ambassador will preside); Monday, Dec. 18 (Cantor Lecture), J. A. Fleming, D.Sc., F.R.S., "The Measurement of High-Frequency Currents and Electric Waves" (Lecture IV.); Wednesday, Dec. 20 (ordinary meeting), Charles L. Burdick, "The Aerograph Method of Distributing Colour."

Incandescent Lamps.—In a paper which he read before the Ohio Electric Light Association, Mr. Francis W. Willcox treated of the subject of high-efficiency electric incandescent lamps. In view of the fact that about 95 per cent. of the energy supplied to a lamp is heat, the importance of utilising the remaining 5 per cent. in such a way as to obtain a proper diffusion of light is obvious. Mr. Willcox enumerated several requirements which in his opinion a standard lamp should satisfy, and in illustration of his remarks he described the "Meridian" lamp as an attempt to provide an efficient unit. In this new lamp the feature of special interest is the improved carbon filament, which gives a true 2½ watts per candle-power lamp. This is a clear gain of 20 per cent. in efficiency for the same life and candle-power performance over the present standard 3·1 watt lamp. The improvement is secured with the ordinary carbon filament subjected to special process, and does not involve the use of any rare metals, or impose any new conditions. The new filament is subjected to additional processes of heating in the electric furnace at temperatures of from 5,400deg. to 6,700deg., resulting in the production of an exceedingly pure form of carbon with a considerable less specific resistance than the ordinary type, and a temperature coefficient which is positive instead of negative. The new filament is capable of withstanding a higher temperature than the old for a given rate of depreciation, and can thus save a greater amount of light per unit of surface. The colour of this new metallised filament is dull grey, and it is claimed to be more stable at high temperatures than is the ordinary carbon.

Hypochlorite Production.—Mr. W. Pollard Digby read a paper at the last meeting of the Faraday Society on "Some Observations respecting the Relation of Stability to Electrochemical Efficiency in Hypochlorite Production," in which he drew attention to the fact that in all electrolytic methods of producing hypochlorite solutions, only a small portion, rarely more than 18 per cent., of the chlorine usually present in the form of chloride is converted into hypochlorite, and suggested that the amount of available chlorine produced from a sodium chloride solution depends upon the relation which the amount of unconverted sodium chloride actually present between the electrodes bears to the current density. As regards stability, particulars were given of two tests in which the rate of depreciation, although only 0·3 grm. to 0·4 grm. in 12 hours per litre for solutions containing 8 grm. of available chlorine per litre, caused a very great depreciation in the yield per kilowatt-hour supplied. The suggestion was advanced that no test of the efficiency of any apparatus for the electrolytic production of the hypochlorites could be regarded as complete without an estimation of the losses through instability, and a mention of the volume of the contents of the electrolysing tank. While stability of solution does not greatly affect the efficiency of any continuous type of apparatus (in which the sodium chloride is fed in at one end and drawn off at the other end ready for continuous use), it would materially affect the efficiency in any non-continuous

Digitized by Google

apparatus, or in any apparatus in which the electrolyte is circulated through an external cooling tank and returned to the electrolyser to be further worked up. Mr. Digby suggested that the presence of minute quantities of iron in the solution have also a bearing on the depreciation.

Rand Power Scheme.—It is reported that the African Concessions Syndicate have been informed by leading American and Continental engineers and experts that the transmission of power from the Victoria Falls to the Witwatersrand is not only quite feasible but would be commercially successful, especially as the climate of South Africa is one of the most suitable in the world for the transmission of power. There is no ice in the rivers to interfere with the working of the turbines, and no snow to break down the transmission lines. The extreme dryness of the climate is also greatly in favour of the project. With reference to statements that the volume of water in the Falls is not sufficient to produce the necessary power, it is pointed out that even in the driest season yet experienced there is sufficient water to produce 500,000 h.p., while at present the Rand only consumes some 150,000 h.p. At the Falls there is an available head of about 330ft., and if more than 500,000 h.p. were needed, it could easily be obtained by cutting a canal, 15 to 20 miles in length, to a point lower down, where there would be a head of 1,000ft., which would be sufficient to produce 1,000,000 h.p. The construction of such a canal would present no difficulty. By the adoption of this scheme it is further pointed out power could be supplied to the mines more cheaply than in any other way. The importance of this can be gathered from the fact that at present over £3,000,000 is spent annually on power on the Witwatersrand, and anything which tends to cheapen this yearly toll would necessarily have a great effect on the profits of the mines. The scheme is regarded as a potential factor towards a South African revival, for the reduction of working costs resulting from its adoption would, it is urged, go far to re-establishing public confidence in South African enterprises.

Single-Phase Railway Working.—In our issue of Oct. 20 we described some of the advantages of single-phase railway working which were communicated to the American Street Railway Association by Mr. C. F. Scott. At the same meeting Mr. W. B. Potter read a paper on the same subject, in which he revealed some of the changes which extended application of the system had necessitated. For the control of equipments aggregating 200 h.p. and over, the type M control, consisting of electrically-operated controllers or switches, is being very generally used. Mr. Potter claims that by it it is not only possible to handle heavier currents and a higher voltage, but a further advantage lies in the fact that the master controller occupies considerably less space than a cylinder controller handling the full motor current. It was found difficult to provide space for an automatic circuit breaker on large equipments where the circuit breakers had to be set for 1,000 amperes and above, and, as a substitute on this heavy class of work, a fuse composed of thin copper strip, enclosed in an insulating chute and surrounded with enough iron to provide a magnetic field, was found to be quite reliable, and is now generally used on large equipments with excellent results. Car wiring is now receiving more attention than formerly, and the recognised practice is to install all wiring in iron conduits, with the ends of the pipes fitted with bellmouths to avoid abrasion of the wire. Though his experience has been gained with direct-current apparatus, Mr. Potter asserts that the essential principles of single-phase working apply equally to the alternating railway equipment. He considers that alternating-current motors can perform any service now done by direct-current apparatus, and, regarded in the light of the recent installations of alternating railway equipments, the outlook for this class is promising.

Electricity in China.—The opening out of Japan is likely to be followed by rapid developments in China. This vast empire, with its enormous resources, kept in the background by the ancient superstitions and indolence of its inhabitants, cannot remain permanently invulnerable to the wave of regeneration which is sweeping over the Far East, and soon the country will be ready for the exploits of the electrician. The United States agent, Mr. Burrill, who was specially detailed to investigate the commercial situation in the Far East, has issued a report in which he urges Americans to push with vigour the sale of electrical goods in China. Although the country generally is not yet ready for an extensive application of electric lighting or traction, the conditions in the large cities are such as would readily lend themselves to the adoption of electricity. There is need not only for electric light and power plants, but for electric railway and tramway equipments. At present there are only a few small lighting plants in the principal cities and one or two insignificant electric railways, but this supply will soon be totally inadequate to meet the expanding requirements of the country. Under the aegis of Japan the development of China cannot be long delayed, and signs are already imminent that the Chinese are about to make an effort to emulate the example of their progressive neighbours. To be forewarned is to be forearmed, and Britishers would do well to keep an open eye on China as a fruitful field in which to display their commercial activities. Not only will we have to compete with America and Europe in that market, but it is morally certain that Japan will not let slip any opportunity for profitable expansion of her commerce in the Far East, and it is a case of those who are first in the field reaping the richest harvest.

Switch-Throwing Device.—In the *American Street Railway Journal* a description is given of an automatic switch-throwing device which the British Columbia Electric Railway Company have been using successfully during the last two years. The switch has been thoroughly tested under all conditions of service and weather on streets where traffic is heavy, and many advantages have been established. The switch can be operated from any distance without stopping the car or without requiring either the motorman or the conductor to leave their positions to attend to it. The result is a saving of time and a less liability of accident. The danger of collisions at switch points or crossings is to a great extent obviated, inasmuch as the motorman is able to see the switch point move over before the car enters the switch. The services of special switchmen are not required, and the cost of maintenance and repairs is a very trifling consideration. The company has spent 3s. 5d. on the first switch installed, the same having been in continual use since installation. The switching device consists of two parts: the switch-throwing lever attached to the car body, and the device installed on the street railway track between the rails. The tongue switch is drilled about 22in. back from the tongue, making a rectangular hole 1½in. by 1½in.; the dog is fitted to the tongue, and connected to the lever in cast-iron box by a connecting rod. The 1½in. wrought-iron pipe which serves as a cover for the long connecting rod is then placed in position, fitting one end into a square box and the other into a long casting, driving the pipe into place to the mark on the pipe. The levers and the chain are then connected up to the two triggers, so as to ensure that all parts are in line, and work easily, before spiking down. A short length of rail, about 6ft. long, is spiked down for the shoe on the

Digitized by Google

switch thrower to run on. The operating rod in the floor of the vestibule can be off set to bring it into the best position for the motorman's use, though the position will naturally vary with the different types of vestibules.

Overhead v. Underground Wires.—The deputy stipendiary of Cardiff, Mr. E. Milne Jones, who sat as arbitrator in the dispute between the General Post Office and the Cardiff City Council respecting the laying of trunk telephone cables on the outskirts of the city, has now given his award. The Post Office authorities have been granted permission to lay down the cables without the imposition of the condition required by the Corporation, the costs of the reference to be borne by the Corporation. The facts of the case were: The Postal Telegraph Department applied for permission to lay down a 3in. line of pipes for a distance of about 1,000 yards on the outskirts of the city running parallel with an existing line of poles carrying a large number of overhead wires. The Corporation consented to the underground pipes being laid on condition that the Telegraph Department would at the same time remove all their overhead wires for this same distance, and while they were excavating for one line of pipes lay the whole of their wires on that particular section underground. This the Postal Telegraph Department declined to do, their chief contention being that the laying of long-distance telephone cables underground very seriously impaired the efficiency of the service. The chief witness of the Postal Department admitted at the inquiry that their long-distance cables ran for a distance of 4 to 4½ miles underground, and on approaching large provincial centres they have the same cables running from 1 to 1½ miles undergrounnd, so that on these lines of service he said there was as much as six miles of long-distance cable underground. The contention, therefore, that 1,000 yards of underground cable in Cardiff would seriously impair the service seems hardly consistent. The Corporation argued that if such long distances of underground cables were necessarily elsewhere, the laying down of 1,000 yards of similar cables in Cardiff could not be a serious matter to the service. The postal telegraph authorities in declining to meet the Corporation in a reasonable spirit have exceeded the powers granted to them by the Telegraph Acts, and in the present instance appear determined to make full use of their privilege regardless of the public convenience.

London Traffic.—Volumes II. and III. of the report of the Royal Commission on London Traffic have been published, and contain evidence, with appendices, tables, and maps. Though the volumes are rather bulky and contain a huge amount of statistical matter, reference to them has been greatly facilitated by the excellent system of indexing adopted, whilst the idea of adding a digest of the evidence of each witness is a good one. The most important proposal which is revealed in the evidence is for the establishment of a Central Traffic Board. There was a remarkable unanimity of opinion that the absence of such a body in the past had been responsible for the complexity and difficulty of the problems which now have to be faced, and that the remedying of this defect was a necessary preliminary to any adequate and durable improvement of the situation. Adopting as their general principles the views set forth by a preponderance of the opinion consulted, the Commission proposed that the Board should consist of from three to five members, should be nominated by the Government, should sit continuously, and should be entrusted with consultative and advisory functions. Among the subjects to which it was suggested that the new authority should give its consideration were the preliminary examination of all private Bills dealing with locomotion in Greater London, the improvement of the main roads leading out of London, the building laws as affecting districts not yet built over within the area of Greater London, the revision and amendment of the laws regulating the breaking up of the streets, and the consolidation and amendment of the laws affecting traffic. A number of eminent tramway authorities alleged that the deficiency in tramway communication was almost entirely due to the existence in the hands of all local authorities of the power of veto over tramway proposals, and the abolition of the power of veto, which could not be brought about without legislative intervention, was emphatically advocated. It is evident that the Government do not intend to pass over the report without action, for, in reply to an enquiry from the chairman of the Central London Railway (Sir Henry Oakley), it was authoritatively announced by the Board of Trade that the Government have sanctioned the preparation of a Bill relating to London traffic, and involving the establishment of a Traffic Board, as recommended by the Royal Commission.

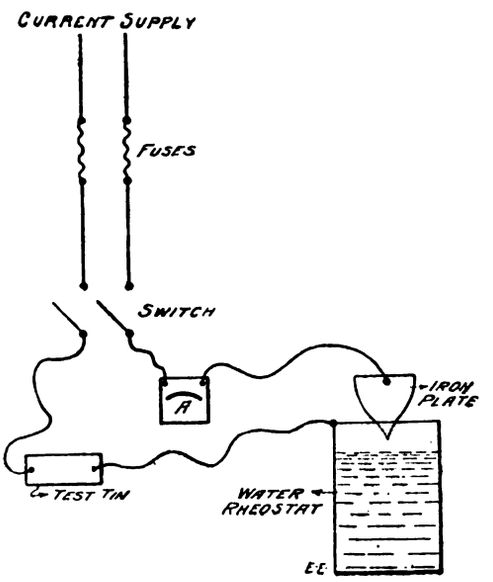
Sydney Trams.—We have received a copy of the *Sydney Daily Telegraph* for Oct. 6, in which appears an article by our old friend, Mr. E. Kilburn Scott, on the cost of running the Sydney trams. We gather from this that an attack has recently been made on the system (which has been introduced and is run by the Government) on the ground that the total operating costs amount to about 9d. per car mile. It is difficult to gather from Mr. Scott's article whether he justifies or excuses this figure, as compared with an average of 6¼d. for ten of the largest tramway systems in the United Kingdom. He gives, however, a great deal of gratuitous advice to the tramway engineers and to the Government, such as the necessity for improvements in track construction, the easing of gradients, the use of regenerative control, and the advisability of having double-deck cars instead of single-deck. These criticisms are no doubt interesting to the officials in question, though we doubt whether they contain anything that is new. What surprises us, however, is to find that Mr. Scott, in dealing with the working costs of the Sydney trams, makes no reference whatever to the conditions which tend to keep the figure so high, and which are the potential factor to be taken into consideration when making comparisons with systems in the United Kingdom. The cost of labour—skilled and unskilled—is much higher than in any of the towns in the United Kingdom. Engineers, for example, whose weekly wage in the United Kingdom averages from 32s. to 35s., were in 1903 paid about 56s. 6d. per week in Sydney. The remuneration for all grades of labour is in Sydney much higher than it is in England, and when it is mentioned that blacksmiths are paid at the rate of 62s. per week, fitters 55s, and foremen fitters about 77s. per week, the unjustness of the comparison becomes evident. These are the rates of wages which were paid in 1903, and, as is well known, they have since risen. Then the fact that nearly all the materials required in the construction and upkeep of the tramways have to be imported accounts in a measure for the increased working and maintenance charges. Notwithstanding that all electrical goods and most machinery required by the State are now imported duty free, the prime cost must be, after all, higher in Sydney than it is at the centre of production, and in this respect the authorities do not enjoy the advantages of their contemporaries in the United Kingdom. After due allowance is made for these considerations, it will doubtless be conceded that the tramway undertaking in Sydney is not an extravagant one, and that the results compare favourably with those of undertakings at home.

Institution of Electrical Engineers.—There was a large gathering of members and associates at the opening

Digitized by Google

of the session last Thursday week. Mr. Alexander Siemens presided over the earlier part of the proceedings, and after presenting the prizes awarded for papers read during the session 1904-5, he formally inducted the incoming president, Mr. John Gavey, C.B., whose inaugural address is appearing elsewhere in our columns. A vote of thanks to the retiring president was carried with acclamation, on the motion of Sir Wm. Preece, K.C.B., seconded by Prof Ayrton, F.R.S. Mr. Gavey, in his presidential address, dealt principally with telephony and telegraphy, and reviewed the more recent developments of these industries. At the close he was accorded a hearty vote of thanks, on the proposition of Prof. Silvanus Thompson, and seconded by Mr. James Swinburne, who remarked that many of the apparently small details connected with telephony and telegraphy afforded infinite scope for engineering. The President briefly acknowledged the vote of thanks, and granted permission to reproduce his discourse in the *Transactions* of the Institution. The following is a list of premiums awarded for papers read during the preceding session: the Institution premium, value £25, to Mr. E. H Rayner for his paper, "On the Effect of Heat on the Electrical and Mechanical Properties of Dielectrics" and "On Temperature Distribution in the Interior of Field Coils"; the Paris Electrical Exhibition premium, value £10, to Prof. H. S. Hele-Shaw, F.R.S, Dr. A. Hay, and P. H. Powell for their paper, "Hydrodynamical and Electromagnetic Investigations regarding the Magnetic Flux Distribution in Toothed-Core Armatures"; the Fahie premium, value £10, to Mr. D. Murray for his paper, "Type Setting by Telegraph"; an extra premium, value £10, to Mr. R. Goldschmidt for his paper, "Temperature Curves and the Rating of Electrical Machinery"; an extra premium, value £10, to Mr. Miles Walker (Manchester Local Section) for his paper, "Compensated Alternate-Current Generators"; an extra premium, value £10, to Messrs. D. K. Morris and H. K. Catterson-Smith (Birmingham Local Section) for their paper on "Some Uses of the Oscillograph"; an extra premium, value £5, to Messrs. J. B. Henderson and J. S. Nicholson (Glasgow Local Section) for their paper, "Armature Reaction in Armatures"; an original communication premium, value £10, to Mr. A. B. Field for his communication on "The Dissymmetry of a Three-Phase System"; an original communication premium, value £5, to Mr. T. Baker for his communication, "The Magnetic Properties of Some Alloys of Iron and Silicon"; the first students' premium, value £8, to Messrs. E A. Biedermann and J. B. Sparks for their paper on "E.M.F. Wave Forms"; the second students' premium, value £5, to Mr. J. W. Anson for his paper, "The Present Electrical Equipment of the London County Council Tramways"; the third students' premium, value £5, to Mr. A. C. Anderson for his paper on "The Applications of Electricity in Mines"; an extra premium, value £4, to Mr. A. E. Jepson for his paper on "Electric Heating"; an extra premium, value £3, to Mr. R. F. Chaffer for his paper on "The Equipment of a Modern Generating Station, with Special Reference to the Chelsea Station of the Underground Railways." The Council has awarded three Salomons scholarships, value £5 each, to Mr. A. E. Clayton, Mr. E. A. F. Goodfellow, and Mr. F. C. Prentice. Two David Hughes scholarships, value £50 each, were awarded to Mr. E. A. Biedermann, and Mr. J. B. Sparks.

Insulating Paints—Mr. Arthur B. Weeks in a contribution to the *Street Railway Review* deals with the different qualities of varnishes on the market for insulating purposes, and emphasises the importance of a discriminate selection by electrical engineers. Some varnishes contain as much as 32 per cent. of resin, and the result is that by their use "permanent elasticity" or a great resistance to electric current is not obtained. The use of clear varnish is now being largely replaced by black insulating paint, on account of the corrosion caused by the former owing to the inevitable presence among its properties of acid. Mr. Weeks considers that there is no especial reason for baking armature coils, if they have first been dried in an oven and then dipped while hot into a good air-drying paint. Such a paint, however, should have plastic qualities sufficient to cement the wires of the coils, and not become brittle even after baking for many days. To obtain baking tests, the baking must be allowed to proceed continuously for several days, and in order that the insulation of the coils be not damaged, the temperature of the oven should not exceed 195deg. F. One of the specimens which came under the notice of Mr. Weeks has withstood a temperature of 240deg. F. for over 24 hours, and it probably would have continued to do so indefinitely without becoming brittle. This varnish, which was black, protected the paper on which it was placed from carbonisation. When a good air-drying paint is desired, and its finish is not sufficiently glossy, a coat of finishing paint can be afterwards applied with a brush. The ideal finishing paint should be air-drying and sufficiently hard in an hour to be handled if



required. Mr. Weeks claims among the advantages of an air-drying paint that nothing is gained by baking when the same results can be attained by means of an air-drying paint; air-drying finishing paint decreases the cost of construction and repairs; an armature coil or field coil gets plenty of baking when in actual service, and baking in ovens, as ordinarily done, lowers the insulation resistance. With a view to observing the actual condition of the paint on a working coil, experiments can be made by taking a sheet of iron from ½in. to ¾in. wide, and punching holes at each end for ¼in. stove bolts. Then it is necessary to procure a water rheostat with connections, as shown in the accompanying illustration. The test tin must be covered with the paint to be tested, and, after it has dried, current passed through the tin. Ammeter readings are then noted, and, by means of a tube thermometer placed on the tin and covered with waste at the point of contact, temperature readings can be taken. By passing a current which will produce 195deg. F., and keeping it as steady as possible for some time, it will be observed that the ideal paint becomes plastic, whilst by cutting off the current for a time the paint becomes hard again. Mr. Weeks insists upon the necessity of obtaining elastic and longer lasting qualities out of paints.

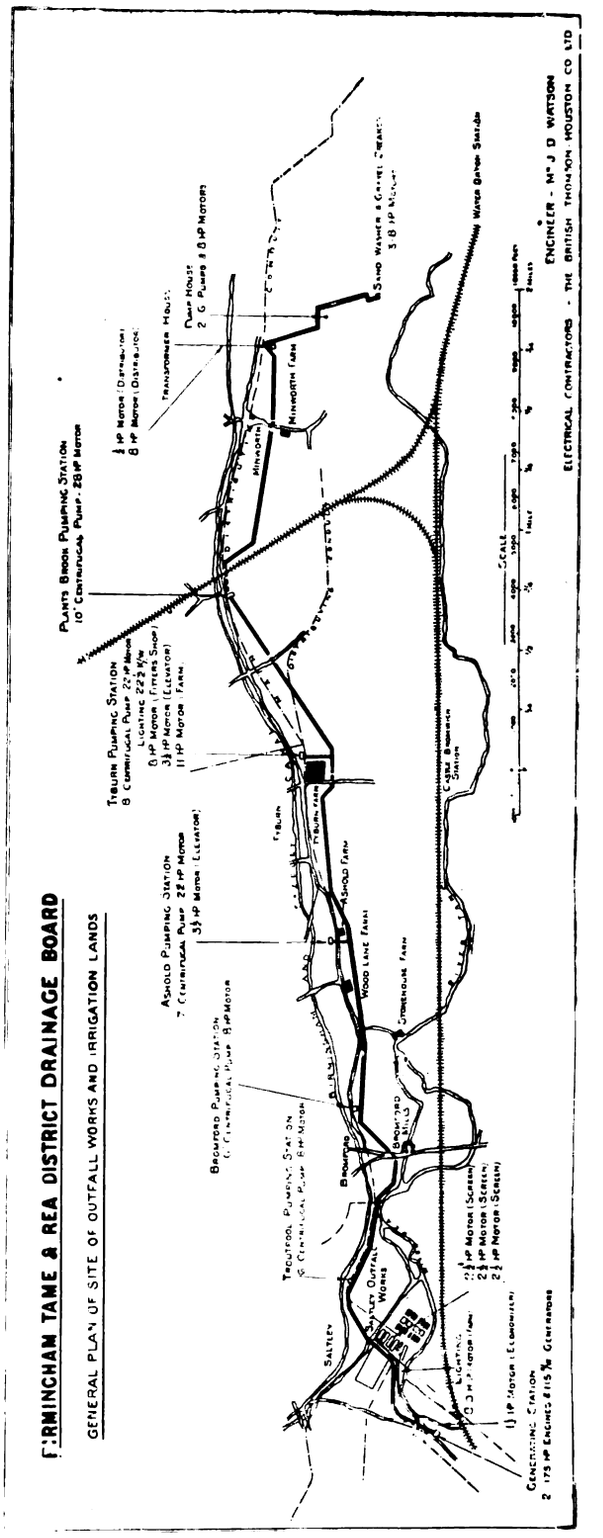
ELECTRICITY AND SEWAGE DISPOSAL.

Birmingham Tame and Rea District Drainage Board.

Among the most recent developments of the use of electrical power is the installation of a complete electrical power transmission scheme extending from Birmingham down the valley of the Tame for a distance of about six miles. The object of the scheme is to enable the Birmingham Tame and Rea District Drainage Board, for whom the work has been done, to pump sewage up to a strip of land adjacent to and situated at a higher level than the main conduit which conveys the sewage from the outfall works situated within the city of Birmingham to the sewage farm located in the Tame Valley, and extending from Birmingham to Curdworth. The inception of the scheme, which was first suggested in 1900, was due to the enterprise and initiative of the engineer to the Board, Mr. John D. Watson, M.I.C.E. The Drainage Board's estate comprises a total area of 2,830 acres, nearly 2,000 of which are used for irrigation, the remainder being land unsuitable for irrigation, or land occupied by roads, streams, buildings, tanks, cottage gardens, etc.

Apart from pumping sewage, the power transmission scheme is employed to drive motors at various places along the valley, to drive sewage screening rakes, sludge elevators, sewage distributors, workshop appliances, farmyard machinery, lighting, etc. The contract for the entire undertaking was provisionally let to the British Thomson-Houston Company, Limited, of Rugby, in July, 1901. As, however, the scheme involved the erection of a destructor by the city of Birmingham on land belonging to the Board, parliamentary powers had to be obtained before the undertaking could be proceeded with, and, owing to various difficulties encountered, which delayed parliamentary sanction, but which were not connected with or incident to the scheme itself, it was not until June, 1904, that the contract was finally confirmed and the work begun. The plant is now in full operation, and when the fact is taken into consideration that, besides the destructor, a generating station and five brick pumping stations, with provision for a sub-station in each, five miles of overhead line with crossings underground under public roads, together with the complete equipment of the generating station, sub-stations, and sundry machinery on different parts of the estate were involved, it will be apparent that no time has been lost in carrying out the undertaking. The generating station is situated near the Saltley boundary of the Drainage Board's estate. It contains two B.T.H. 115-kw. alternating-current generators (Fig. 2), each of which is coupled to a high-speed Belliss and Morcom engine. The generators are designed to give their output at 2,250 volts 50 periods, each being fitted with a direct-connected exciter, so that the unit is self-contained. A small continuous-current steam set of 15 kw. 220 volts is also installed in this station. This latter set is used to operate a number of B.T.H. enclosed arc lamps on the sewage beds at Saltley, to light the station, and, in case of necessity, to excite the alternating-current generators. The steam is supplied to the engines from Lancashire boilers combined with the destructor, which is adjacent to the generating station. The destructor, as before mentioned, was erected by the city of Birmingham, and steam is supplied to the Drainage Board under an arrangement with the authorities of the city of Birmingham. Thus the cost of power required is reduced to a minimum by the utilisation of material that would otherwise be valueless, or even objectionable. Messrs. Heenan and Froude were the contractors for this destructor, which is of their well-known type. Steam is raised in three Lancashire boilers made by Messrs. Taylor and Sons, of Marsden, 30ft. long by 8ft. diameter, constructed for 160lb. pressure. The economisers are of the Clay Cross type.

The engine-room and boiler-house are lighted from the generating station, and there are two alternative systems of lighting—one from the continuous-current side, and one from the alternating system of supply from the main generators. In the latter case suitable transformers are provided in a transformer chamber under the generating station to reduce the pressure from the primary 2,250 volts to 220 volts, which is the pressure of the lighting circuits. The main switchboard (which is illustrated in Fig. 3) contains two generator panels, each of which carries complete apparatus for one of the alternators, including the main switch, which is of the British Thomson-Houston Company's well-known "oil-break" type, ammeter, and voltmeter, together with the field rheostat for varying the excitation of the alternator. There is also one feeder panel



controlling the supply to the overhead line, and to the station power and lighting transformers, one meter panel containing a B.T.H. three-phase wattmeter for measuring the total output of the alternators, and a B T.H. continuous-current wattmeter measuring the output of the small continuous current set.

The 'bus bars are connected to the overhead line by means of three high-tension cables, separately supported from the walls of the generating station by heavy porcelain insulators, and led up to the outlet, which consists of three

Digitized by Google

separate porcelain outlet tubes built into the wall. Through these tubes high-tension insulated cables are led, and connected outside on shackle insulators to the overhead line, which consists of hard-drawn copper of special high tensile strength, supported throughout its entire length by high-tension insulators of the triple-shed type. The section of the copper in the overhead line is so graded that a drop in pressure of only 7½ per cent. over the whole line is obtained at maximum load. Throughout the length of the overhead line a barbed wire is run on the top of the poles, and earthed at frequent intervals for protection against lightning.

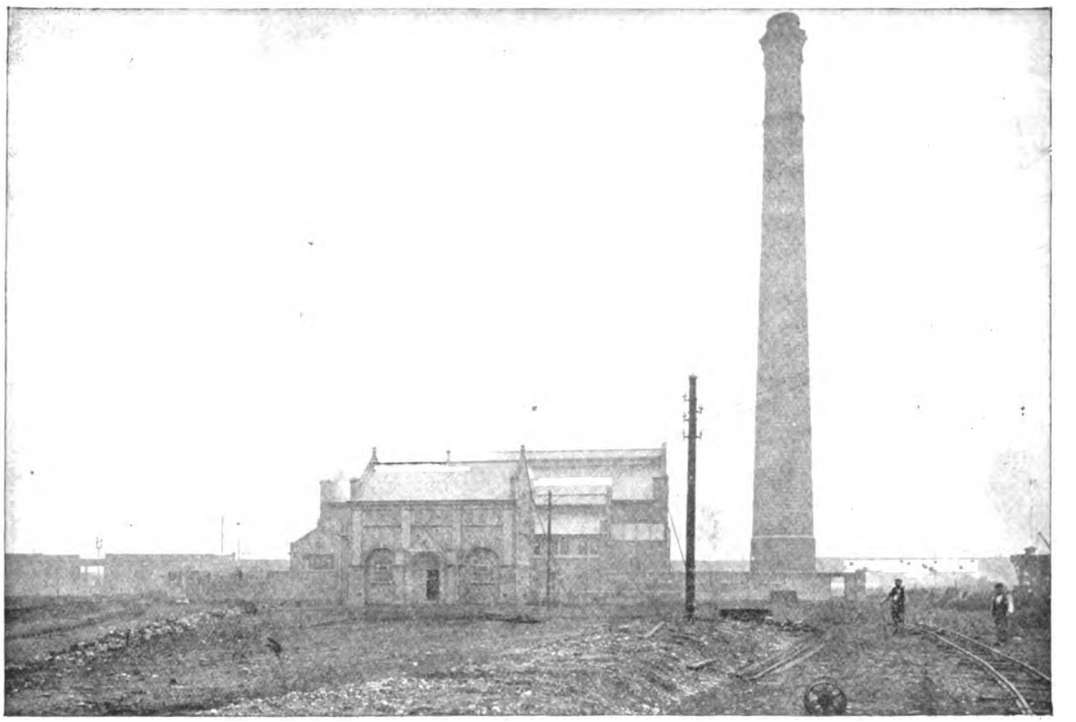


FIG. 1.—Destructor and Main Generating Station at Saltley.

In all cases where the overhead line enters or leaves a building, lightning arresters of the standard B.T.H. alternate-current type have been installed.

For the underground road crossings a special form of steel terminal pole (Fig. 4) has been designed, on the top of which is fitted a dividing box into which the high-tension overhead wires are led, and there connected to a three-core high-tension cable which is led down the inside of the pole and brought out at the bottom into the connection box. The cable from this point is laid in solid bitumen to the steel terminal pole on the opposite side of the crossing, where it is connected through another dividing box to the high-tension line. It then proceeds overhead up to the next crossing. The rest of the poles (Fig. 5) are of creosoted wood, and are set in concrete on account of the soft character of the soil in which they are planted, most of the land being under irrigation.

From the generating station the line proceeds to the

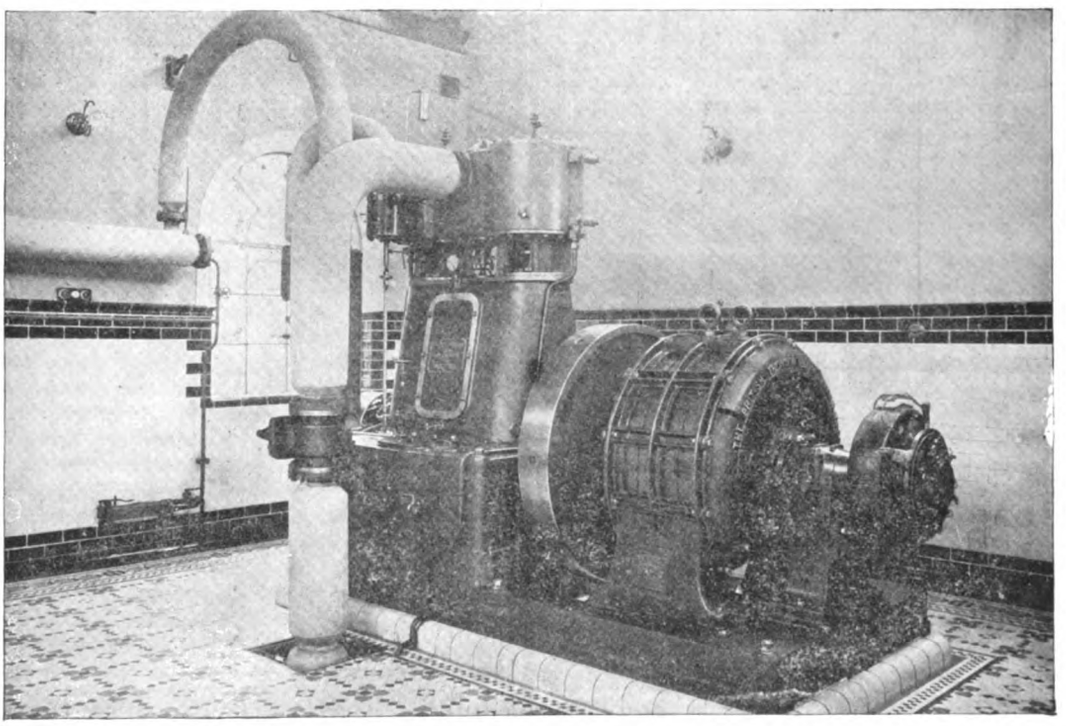

FIG. 2.—115-kw. B.T.H.-Belliss Generating Set.

Drainage Board's Saltley farm. At Saltley the line is tapped and led into a sub-station which is a portion of the old farm buildings converted for the purpose. This sub-station (Fig. 6) contains three B.T.H. transformers, each of 5 kw. capacity, and the necessary controlling switchgear. These transformers are used for supplying power to three 2½-h.p. B.T.H. motors driving sewage screens, and one

Digitized by Google

8-h.p. B.T.H. motor driving farm machinery through a countershaft, and for lighting the offices and the house of the superintendent of works. The 2½-h.p. motors for driving the screens are 200-volt, 50-cycle machines, running at 1,420 r.p.m., and are connected to the screens through spur reduction gearing. From Saltley the high-tension line proceeds towards Minworth to the Troutpool pumping station. All the pumping stations are of artistic appearance, and do not in the least detract from the landscape. They were designed in the offices of the engineer to the Board, as was also the generating station and destructor at Saltley. Each pumping station is divided into two rooms, one containing the pump, motor, starting gear, and high-tension switchgear, and the other the transformers.

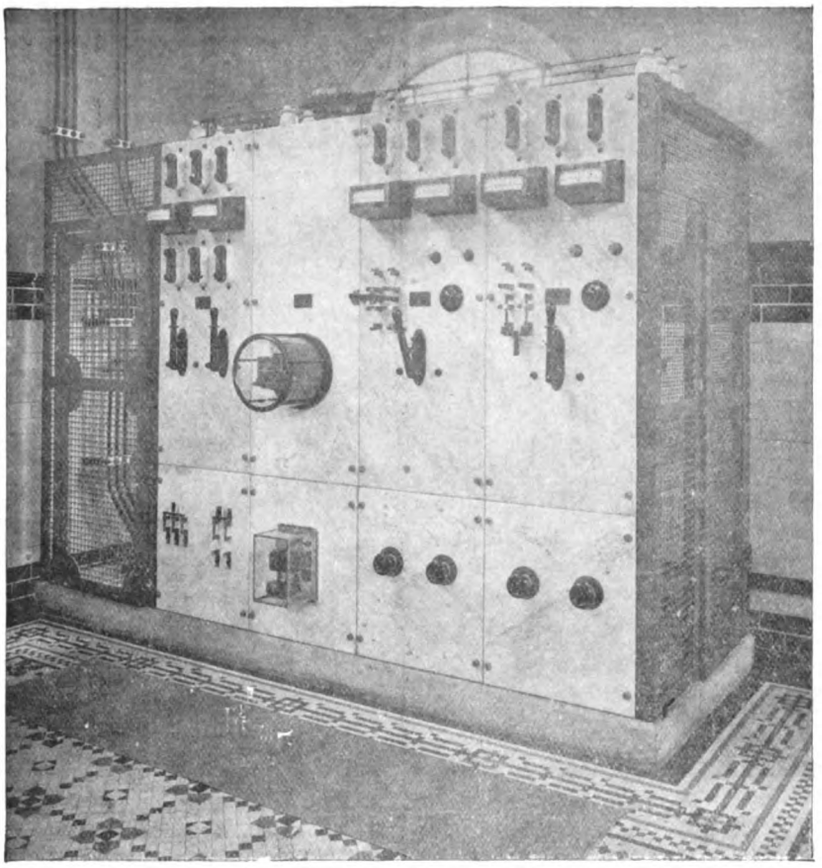

FIG. 3.—Main Switchboard, Saltley.

The Troutpool pumping station contains one 6in. Gwynne centrifugal pump (Fig. 7) designed to raise 696 gallons per minute against a head of 16ft. It is direct-connected to a B.T.H. 8-b.h.p., 712-r.p.m., three-phase motor. The starting arrangement for this motor is supported on brackets from the floor immediately adjacent to the motor, and the same plan is followed in all the other pumping stations. The switch panel (which in every case includes a B.T.H. high-tension oil switch for isolating the station

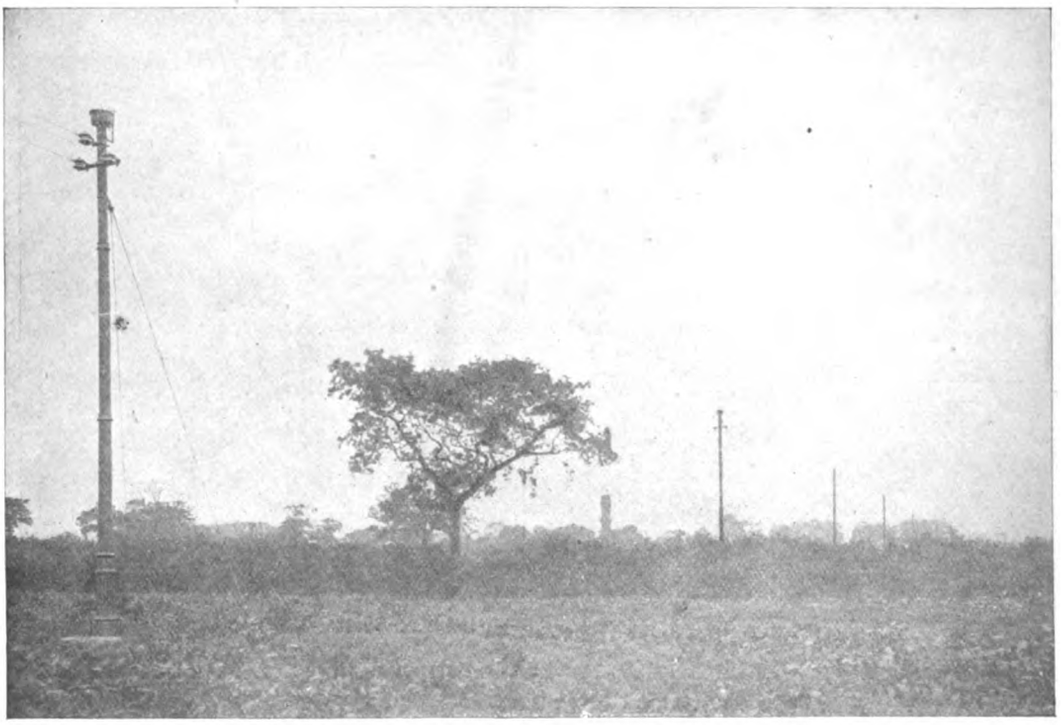

FIG. 4.—Underground Road Crossing, showing Steel Terminal Poles.

Digitized by Google

from the line) is built into the wall, so that the back of the panel is accessible from the transformer chamber only. All parts carrying high-tension current are on the back of the panel, and it is, therefore, impossible for accidental contact to be made with the high-tension gear from the front of the panel. The transformer chamber at Troutpool contains two 4-kw. single-phase transformers having a ratio of 2,200 to 200, and is divided from the pump-room by a brick partition, the door between being kept locked, and access to it obtained only by the authorised staff of the Board; thus the risk of accident due to ignorance or carelessness is reduced to a minimum. Similar precautions are taken at all the other stations. In all the pumping stations the cables connecting the transformers to the switchboard are run in special trenches, covered by chequered plates and readily accessible. The back of the switch panel projects into the transformer chamber in such a manner that the switch panel itself really forms a portion of the dividing wall between the pump-room and the transformer chamber. This ensures the most efficient and shortest length of cable connections possible between the transformers and the controlling gear. All the pumping and sub-stations are arranged in a similar manner, the only difference being in the number of circuits controlled from the sub-station to meet the requirements of the particular area supplied from it.

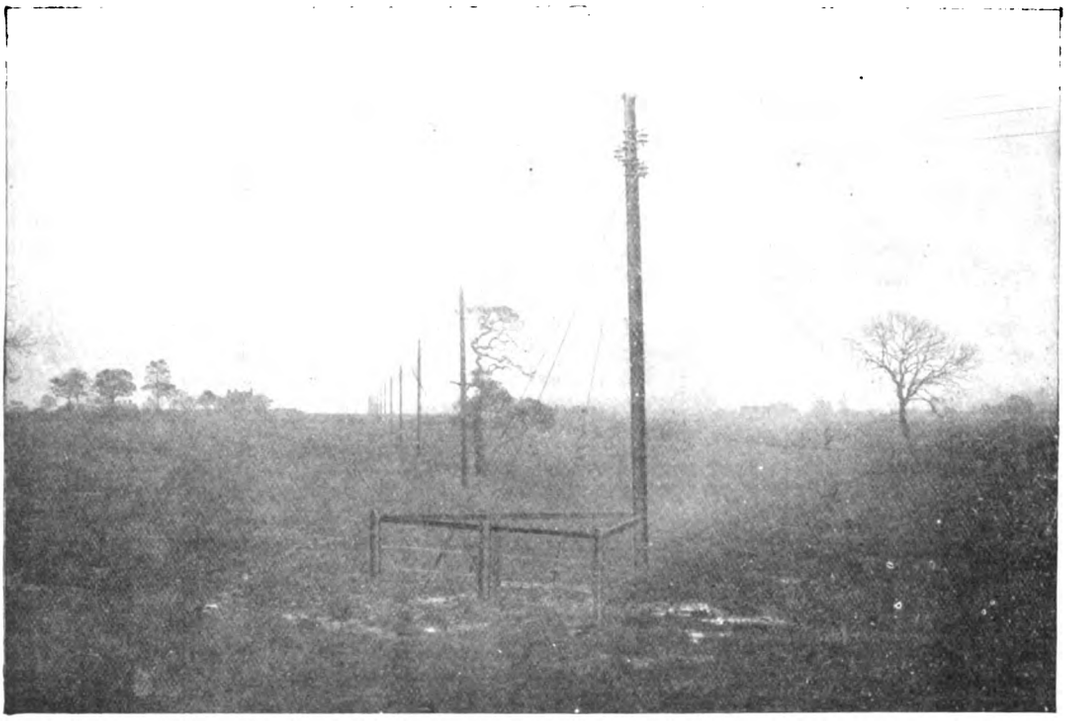

FIG. 5.—High-Tension Main Pole Line.

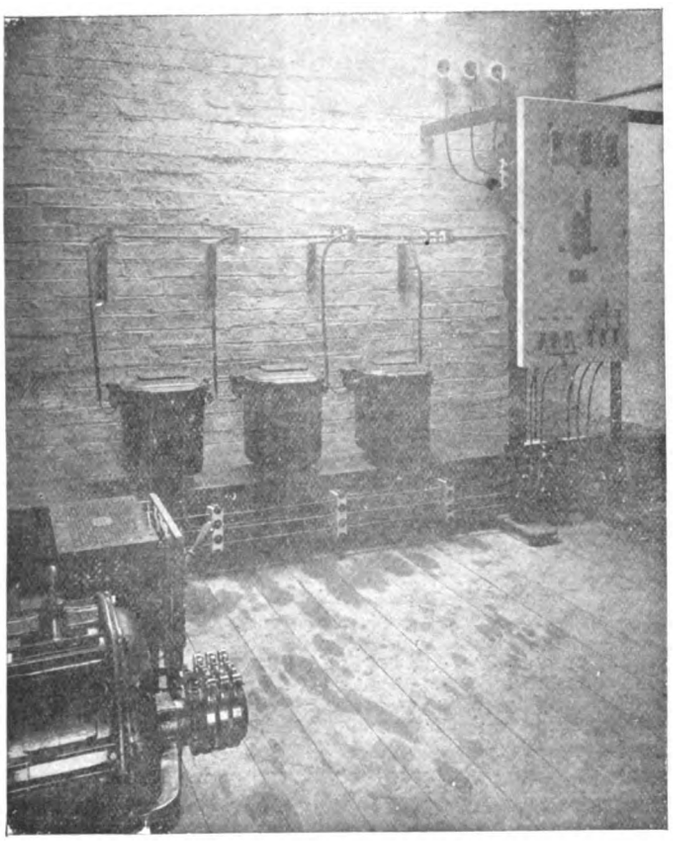

FIG. 6.—Saltley Sub-Station Transformer Room.

From Troutpool the line proceeds to a pumping station at Bromford, which, like the Troutpool pumping station, is equipped with a Gwynne 6in. centrifugal pump designed to raise 696 gallons per minute against a head of 16ft. and direct connected to a B.T.H. motor of 8 b.h.p. capacity. The transformer equipment in this station is similar to that at Troutpool. From Bromford the high-tension line proceeds to a pumping station at Ashold. This station contains one 7in. pump designed to raise 896 gallons per minute against a head of 32ft. It is direct-connected to a B.T.H. motor of 22 b.h.p. capacity, working at 575 revolutions per minute. The transformer chamber at the Ashold sub-station, which is designed in a manner similar to those already described, contains three single-phase transformers of 10 kw. capacity each, and a switchboard built in the wall for controlling the high-tension current from the line to the transformer and thence to the motor. In the case of this sub-station, however, the high-tension line is brought into the station underground, whereas in the

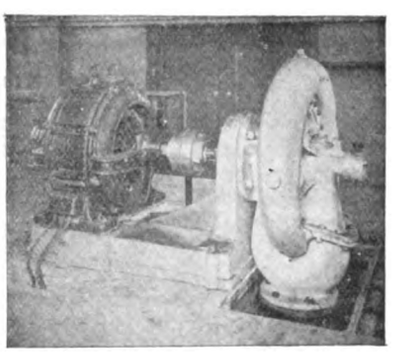

FIG. 7.—Motor and Gwynne's Pump.

Digitized by Google

case of the others the high-tension line is tapped immediately opposite the sub-station, an offset being taken, and the line led into the sub-station from shackle insulators, to which are connected three highly insulated cables, which are led through the wall of the sub-station through a special type of porcelain duct. There are two low-tension circuits at Ashold, one for the pump motor and one for the 3½-h.p. motor driving an elevator similar to that at Tyburn. From this station the high-tension line proceeds direct to Tyburn, where the largest pumping and sub-station is situated. This station is also connected to the high-tension line by underground cable. The transformer chamber contains three 15-kw. single-phase transformers and three 7½-kw. single-phase transformers, each being arranged for a ratio of 2,200 to 200 volts. The 15-kw. transformers are for the power circuits, and the 7½-kw. transformers for the lighting circuits. They are all of the B.T.H. standard "oil-cooled" type.

At Tyburn the three power circuits are as follows: Circuit No. 1 controls one B.T.H. motor of 8 h.p. running at 960 r.p.m., and one 11-h.p. motor running at 965 r.p.m. These motors are used for the operation of general farm machinery and for driving machinery in the mechanics' and joiners' shops, where the mechanical repairs required to the existing plant on the Board's estate are carried out and any special tools required on the estate are made. Circuit No. 2 controls the pumping station proper, which, as in the case of the other stations, is immediately adjacent to the transformer chamber and contained in the same building. This station contains a Gwynne 8in. centrifugal pump designed to raise 963 gallons per minute against a head of 30ft. This pump is direct-connected to a B.T.H. three-phase induction motor of 22 h.p. running at 575 r.p.m. Circuit No. 3 controls one 3½-h.p. motor running at 1,420 r.p.m. and driving a sewage elevator. The cable supplying this motor is partly underground and partly overhead. The general arrangement of the motor and gearing is shown in Fig. 8. The secondaries of the lighting transformers are connected to a special switchboard, from which the circuits for the offices, engineer's residence, and the home farm buildings are controlled. The cables for supplying these circuits are laid underground from the sub-station to the various buildings.

The high-tension line continues from Tyburn to Plant's Brook, which has the heaviest duty of any of the pumping stations on the estate. This station is a pumping station only, and contains one Gwynne 10in. centrifugal pump designed to raise 1,900 gallons per minute against a head of 17ft. It is direct-connected to a 28-h.p. three-phase B.T.H. induction motor running at 475 r.p.m. The transformer chamber contains three 10-kw. single-phase transformers having a ratio of 2,200 to 200, and the usual controlling switchboard. Near this station the high-tension line is led into a conduit laid for the purpose under the Midland Railway in 1900, and thence to Minworth Greaves, where at present it terminates. The sub-station at Minworth Greaves is used for supplying power to operate two sewage distributors, which were previously operated mechanically, and are used for distributing sewage over circular bacteria beds. This sub-station contains three transformers having a ratio, as before, of 2,200 to 200 volts and the necessary switchboard. Provision has been made under a new contract to extend the high-tension line from this point one half-mile further towards Curdworth, where the Drainage Board are carrying out very extensive works in the building of bacteria beds, and where it is intended to light the beds with arc lamps and to electrically operate the gravel-washing machinery, consisting of a pump, stone-crusher, and winch. It is also intended to extend the use of the electric power thus obtained by installing silt pumps 400 yards from the Minworth Greaves terminus.

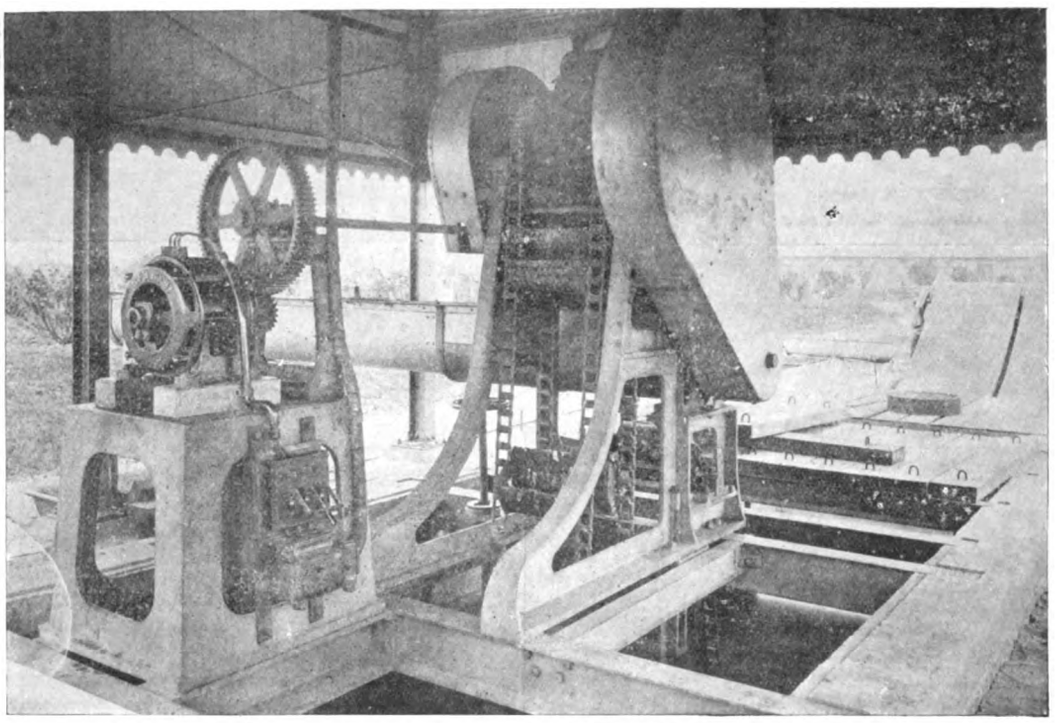

FIG. 8.—B.T.H. Motor driving Sewage Elevator.

The estimated cost of the whole scheme is made up as follows:

Corporation of Birmingham.			
Buildings—comprising destructor house, inclined roadway, furnace chimney, two cottages, boundary walling, entrance gates, and weigh office	£11,647	0	0
Two acres of land	800	0	0
Paving new road, etc.	1,000	0	0
Refuse furnaces, air heaters, and fans and engines	4,244	10	0
Total for Birmingham Corporation carried to summary	£17,691	10	0
Drainage Board.			
Boiler-house and main generating station buildings, three Lancashire boilers, one economiser, and all steam pipes, together with two boiler feed pumps, and one feed-water heater	£5,380	12	0
Overhead travelling crane	128	0	0
Electrical work in the main generating station	3,035	0	0
Power transmission line	2,177	0	0
Saltley sub-station	270	0	0
Five pumping stations complete, including pumping mains	6,076	0	0
Minworth Greaves sub-station	170	0	0
Lighting and sundries	900	0	0
Total for Drainage Board carried to summary	£18,137	12	0
Summary.			
Corporation of Birmingham	£17,691	10	0
Drainage Board	18,137	12	0
Total cost of scheme	£35,829	2	0

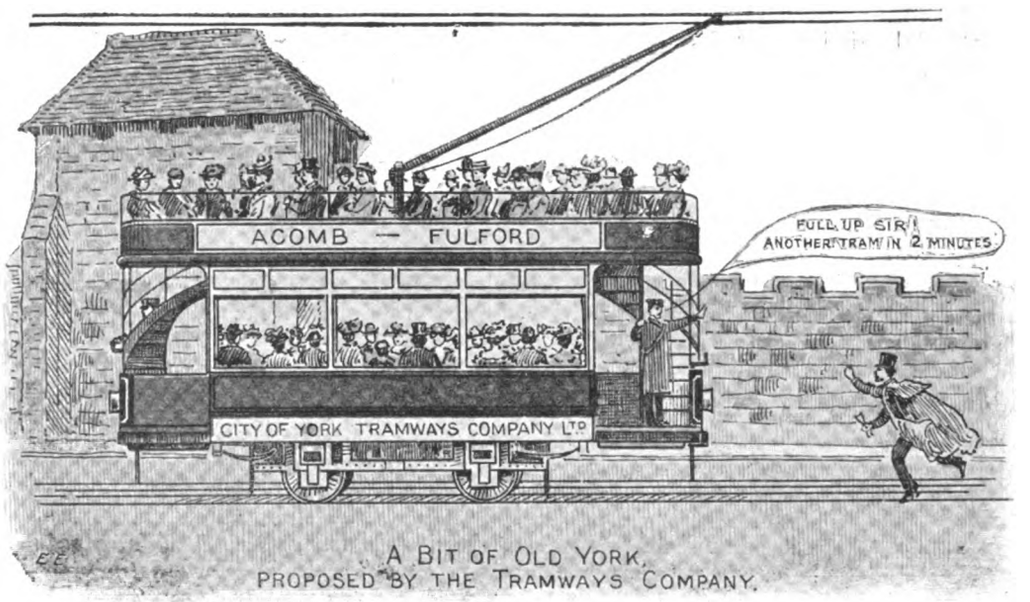
Digitized by Google

There is no doubt that the undertaking of the Birmingham Tame and Rea Drainage Board, embodying as it does all the features of a comprehensive high-tension power distribution scheme, is one of the pioneer undertakings of its kind in this country, and it is the first scheme of its kind in the world. Developments arising of a direct outcome of the undertaking will undoubtedly be watched with considerable interest by all those interested in the application of electrical power to the complex problem of sewage disposal and other industrial purposes.

YORK TRAMWAYS.

We should like to have headed this article "York Electric Tramways," but are unable to do so. It must be remembered that York is one of the most ancient and honourable cities in the United Kingdom. Its Corporation resembles the city in its characteristics for doing business, but when describing the Corporation most emphasis must be laid on the word "ancient." We remember in the nineties, when electric lighting was first proposed for York, the matter was taken up most thoroughly. The Corporation obtained reports year after year from one and then another of the leading consulting engineers until they had exhausted even the talent of Westminster. They then tried to sell their undertaking to two or three companies without being able to decide which offer was the most favourable. The net result was that while the electric lighting order for York was granted in 1890, it was on April 1, 1900, when the supply commenced. We do not suppose the date was chosen for any particular reason, but it is amusing to notice that after 10 years' delay they started their municipal supply on April 1. Having settled the large question of electric lighting, which undertaking has since developed, as was to be expected, the question of tramways arose, and still arises periodically without any result. The post cards reproduced herewith show that certain inhabitants appreciate the humour of the situation. The first card we reproduce is not really the first which was issued, but as we were unable to find the name of the publisher of it we could not reproduce that one without infringing copyright. The history of the tramways is as ancient and as interesting as that of electric lighting. A tramway company owns the horse trams, and the period of their original order has expired. They can be bought out in consequence at the end of periods of seven years. The company in 1897 obtained necessary parliamentary power to work their tramways by electricity or other mechanical means other than steam, but these powers are subject to the approval of the Corporation. The same thirst for knowledge and lack of decision have characterised the Corporation in this matter. Their officials have, we gather, informed them of the advantages of a good system of electric trams owned and worked by the Corporation. The tramway company has offered repeatedly to equip their lines electrically, and asked for the approval of the Corporation, but the result is nil. In 1901 the Corporation woke up, and entered into an agreement with the company to purchase their undertaking.

A BIT OF OLD YORK,
RETAINED BY THE CORPORATION.



A BIT OF OLD YORK,
PROPOSED BY THE TRAMWAYS COMPANY.

Digitized by Google

subject to obtaining powers to do so from Parliament. The Corporation Bill, however, was rejected in March, 1902, because a poll of the ratepayers showed that the general feeling was against the spending of the requisite money. The actual result of the poll was that 6,673 ratepayers were against the Corporation undertaking tramway work, as against 5,381 in favour. After such a decision one would have expected the Corporation to fix up an agreement with the company for the electrification of the tramways, subject to the company purchasing all the energy required from the Corporation electricity department. Such expedition, however, would not be in keeping with the ancient customs of York. The matter has been shelved again, and now certain of the inhabitants have started the circulation of libellous post cards with an object of ridiculing the tramway company. We trust that this ridicule will rebound on the City Fathers, who should surely understand that horse tramways in 1905 are not a sign of progress. When these tramways were designed some 30 or more years ago they were considered suitable for the then population. Now a wide network of lines is needed to serve York and the outlying suburbs, and we trust that the Corporation will either decide promptly to do the whole of this work themselves, or else arrange for the tramway company to do it on terms favourable to the inhabitants. Perhaps, however, it is too much to expect that the tramway question should be settled under the 10-year period which it took to put the electric lighting order in force.

BARKING ELECTRIC TRAMWAY.

Inspection and Opening.

The urban district of Barking Town, which has recently embarked upon a tramway scheme, has an area of 3,813 acres, and the population is estimated at 27,500. The town is rapidly developing as a residential district, and many large works have been and are being established within its area. In 1898 the Council applied to the Light Railway Commissioners for power to construct a line about 1½ miles in length from Barking Town to the Beckton gasworks, where a large number of men resident in Barking Town are employed, and which necessitated the construction of a lifting bridge over the River Roding. The entire cost of this bridge has been debited to this short section of line, and it is, therefore, not surprising that it has hitherto prevented this light railway undertaking being financially successful. In November, 1898, application was made to the Board of Trade for a tramway provisional order authorising the construction of 7½ route miles of tramways, but some of these lines were subsequently struck out by the Council, and eventually 3½ miles were authorised.

Owing to difficulties in land purchase, etc., the Beckton Light Railway was not opened till Dec. 1, 1903, and the Council had meanwhile determined to abandon the tramway powers and proceed with an extension order under the Light Railways Act. This course was adopted partly in order to simplify the keeping of accounts and partly because the district had by this time considerably developed, and new streets had been laid out giving better access to Ilford. In May, 1902, therefore, the District Council applied for powers under the Light Railways Act to construct lines connecting the Beckton line with the East Ham and Ilford tramways systems About the same time the London, Tilbury, and Southend Railway Company applied to Parliament for certain powers, and to meet the opposition of the Council agreed to replace the level-crossing in East-street with a bridge. The property required for this bridge is now purchased and the actual construction will shortly commence, but until this is completed the through line cannot be constructed In the autumn of last year, however, contracts were placed for the construction of a line connecting with the Ilford system at Loxford Bridge and running down Fanshawe-avenue to Longbridge-road, and for a line connecting with the East Ham system at the district boundary in London-road and running along London-road to North-street, and this was subsequently extended through North-street and East-street to Ripple-road. Thus the section still to be constructed when the railway bridge is completed has a length of about a quarter of a mile along Longbridge-road from Ripple-road to Fanshawe-avenue. The Fanshawe-avenue line line was completed and opened for traffic in the spring of this year, and has since been worked by the Ilford Urban District Council by agreement with the Barking Town Council. The London-road section now opened will be similarly worked by the East Ham Corporation. With the completion of the short section above referred to joining the East Ham and Ilford portions, a very important link will be made in tramway communications in the East-end of London, as there is very little doubt that after a short time a circular route will be opened from Aldgate *viâ* West Ham, East Ham, and Ilford on the old Eastern Counties coaching road, through Ilford-lane and Barking, returning *viâ* the line just opened through East Ham and West Ham, and *vice versâ*.

The line is approximately two-thirds of a mile in length, practically all double track. The track consists of 100lb. British standard No. 3 girder rails laid on 6in. of concrete to a 4ft. 8½in. gauge. The joints are made with standard fishplates 1ft. 6in. long, and four 1in. fishbolts and Cooper and Howard-Smith's patent anchor joints, and are double bonded with 3/0 B & S gauge crown type solid copper bonds. The paving is of selected Norway granite, except a short length in front of the Council offices and Wesleyan Church, where jarrah blocks are employed. The points and crossings are of Era manganese steel, while the overhead work is mainly of span construction. The feeder cables are laid on the solid system, current being supplied from the Barking Town Urban District Council's power station in East-street, which was erected in 1899. It contains 600 kw. of plant in Babcock and Wilcox boilers, and high-speed, double-acting, condensing engines by Messrs. W. H. Allen and Co. and the Sunderland Forge Company coupled to direct-current lighting or traction generators, which with the opening of the new tramway section will be completely loaded up. A 400 kw. set is being installed by Messrs. Davey, Paxman, and Co., with a Johnson and Phillips generator, while a new Babcock and Wilcox superheating boiler, feed pump, and water softener have just been started up. The bulk of power generated in the station is being utilised in factories in the neighbourhood, some 500 h.p in motors being connected to the mains. Power is also supplied for the Barking-Beckton Light Railway with its electrically operated lifting bridge, besides the section of Ilford tramways in Barking.

The contractors were: rails, track construction, and cable system, Mr. Daniel T. Jackson, of Barking, with sub-contractors; Messrs. Bolckow, Vaughan, and Co., for rails; Messrs. W. T. Henley's Telegraph Works Company, for cables; Messrs. Burgess, Burgess, and Co., for setts; and Messrs. Hadfield's Steelfoundry Company, for points and crossings. The overhead construction on the London-road section was carried out by Messrs. Dick, Kerr, and Co., and Messrs. Robert W. Blackwell and Co. equipped the North-street and East-street section. Messrs. Hawtayne and Zeden acted as consulting engineers, and associated with them in the work were Mr. C. J. Dawson, consulting surveyor to the Council; Mr. C. F. Dawson, the Council's surveyor; and Mr. A. Hugh Seabrook, the Council's resident electrical engineer.

Many local improvements have been carried out in conjunction with the laying of the lines, and much extra work has devolved on the Council, their committee, and officials. The principal road improvement completed is the new bridge across the River Roding in the London-road, constructed by the County Council, and the general improvement of this road as regards levels and paving. Mr. J. N. Reeson was chairman of the Council when the work was commenced, but on the shoulders of Mr. J. Wilson, the present chairman, and of Mr. L Crow, who has for three years been chairman of the committee, the principal work has devolved. Mr. Hargreaves, the able clerk to the Council, has also had much to do with the successful carrying through of the work.

The official inspection of the London-road section took place on Wednesday last, and was conducted on behalf of the Board of Trade by Colonel von Donop. Accompanying the inspector were Mr. W. C. C. Hawtayne (of Messrs.

Digitized by Google

Hawtayne and Zeden, the consulting engineers); Mr. Daniel T. Jackson, the contractor; Mr. A. Hugh Seabrook, the electrical engineer; Mr. Ullmann, electrical engineer, East Ham tramways; Mr. Owen, traffic superintendent; Mr. Blain, traffic superintendent of the West Ham tramways; and several members of the Barking, East Ham, and West Ham Councils. A tour was made over the new line, and the Board of Trade representative expressed his satisfaction with the system. The inspection being over, the company adjourned to the public offices, where light refreshments were partaken of. Mr. W. C. C. Hawtayne proposed success to the Barking Town Urban District Council, and congratulated the committee upon the successful completion of the undertaking, which, he said, would pay handsomely as soon as a linking up of the neighbouring boroughs was effected. Soon, he added, the connection between Barking Town and Ilford would be completed, and then would follow the completion of a route extending from Aldgate to West Ham and on to East Ham, returning by way of Ilford, Barking, East Ham, Poplar, to Aldgate. Mr. Hawtayne acknowledged the services rendered by the officials in the employ of the Council, and the assistance which had been given by members of the committee. On behalf of his firm and the contractor he presented Mr. Councillor Wilson, chairman of the Barking Town Urban District Council, and Mr. Alderman Savage, the chairman of the East Ham Tramways Committee, with silver salvers, suitably engraved, as tokens in remembrance of the opening of the new route. Both recipients responded, and Mr. Councillor Crow, in acknowledging the toast on behalf of the Barking Urban District Council, paid tribute to the work of the consulting engineers, Messrs. Hawtayne and Zeden, and to the contractor, Mr. D Jackson He referred to the impending departure of their electrical engineer, Mr. A. Hugh Seabrook, who is about to fill a similar office under the West Ham Corporation, and stated that in the four or five years during which that gentleman had served the Council he had been able to turn a deficit on the electric light undertaking into a balance of 7 per cent. on the capital. Several other speakers referred to the growing feeling of amity between the borough councils of the district, and the proceedings were brought to a close. It may be mentioned that the track and equipment were provided by the Barking authorities, and the undertaking leased to the East Ham Corporation for a period of five years. The East Ham, West Ham, and Ilford Councils' tramways have all running powers over the track. The line will be opened for public traffic this morning (Friday).

FREMANTLE TRAMWAYS.

The work of converting the present antiquated 'bus service into an up-to-date electric tramway system is progressing rapidly, and in a very short time the conversion should be complete. The power-house was formally opened some time ago, and the first completed portion of the machinery set in motion. It is located at the South Mole, on the water edge, and is a substantial brick structure. The interior is divided into a boiler-room and an engine-room, the former being 87ft. long by 45ft. wide and 20ft. high; the latter is 87ft. long by 30ft. wide and 14ft. high. At the end of the power-house is another building, 60ft. long by 28ft. wide, which is to be used for housing the battery. The brick stack is located in one corner of the boiler-room, and is 109ft. 6in. high, 13ft. 3in. outside diameter at base, and 8ft. 9in. outside diameter at top.

The boiler-room contains four Babcock and Wilcox boilers, each capable of evaporating 4,278lb. of water per hour, and are built in two batteries of two boilers each. The feed pumps are two in number, and are of the Worthington duplex type, while a Guttmann water softener is installed on account of the hardness of the local water. In the main flue from the boilers is located a Green's economiser, divided into two sections. There are 96 tubes in each section, arranged in eight rows of 12 tubes, each being 9ft. long and 4½in. diameter. A small Westinghouse motor is located on top, and drives the scrapers through a wormed gear. The condensing system consists of a Worthington surface condenser, 12ft. long, 2ft. 7in. wide, and 4ft. 8in. high, mounted on concrete piers. The air-pump is by the same maker, vertical, three-throw, single-acting, and is driven by a Westinghouse 500-volt variable-speed motor. A centrifugal pump directly connected to a Westinghouse 500-volt variable-speed motor is installed. This pump supplies the circulating water for the condenser.

There are four Bellis and Morcom engines and four Westinghouse generators, two being for direct current for the tramways and two for alternating current for the lighting. The engines are of the very latest high-speed English type. They are each capable of developing 235 b.h.p. running at 430 r.p.m. on steam at 150lb., with superheat up to 150deg. F., and vacuum of 27in. They are of the enclosed type, having forced lubrication, which is supplied by a small valveless pump located in the base of the engine and connected to the main shaft. They are double-acting, and controlled by a piston valve, which is governed by an enclosed governor located at the end of the main shaft, and which is capable of hand adjustment for speed when the engine is running. The efficiency of these engines when in operation under the conditions they are to operate here will be higher than engines of twice their size as in ordinary use. The direct-current generators are of the latest Westinghouse type, and are 550 volts, 430 r.p.m. each, having a capacity of 150 kw., one capable of standing a 50 per cent. overload for short periods and a 25 per cent. overload for five hours. They are directly connected to the engine shaft, and are compound wound for automatically increasing the voltage for the tramway load. The two alternating-current generators are of the Westinghouse two phase type, having a capacity of 150 kw. each. The voltage is 2,200, periodicity 50, and run at 430 r.p.m. They have revolving fields, which are excited by a small exciter which is directly connected on the generator shaft, the main generator being, like the direct-current generator, directly connected to the engine shaft. The armature is stationary, is well insulated, and is protected by an open cast-iron frame.

The direct-current switchboard for the control of the direct-current generators, and for the distribution, is composed of five panels. There are two generator panels, one battery panel, and two feeder panels. The generator panels are composed of two sections of the best blue Vermont marble. The lower section contains the field resistance and controller handles, the upper section having a main switch, a circuit breaker for the negative and equaliser wires, an ammeter and voltmeter plug. The battery panel has one double-pole switch and single-pole switch, one single-pole double-throw switch, a circuit breaker, a differential voltmeter, a differential ammeter, resistance for the shunt field of the exciter of the booster. The two feeder panels have provision for two feed circuits each. Each panel has two circuit breakers and two single-pole switches, two ammeters, and the usual accessories. The board has also a Thomson recording wattmeter for measuring all the power sent out, a voltmeter and ammeter for measuring the total voltage and currents. The alternating current switchboard is composed of six panels, having two generator panels, one arc lighting panel, and three feeder panels. Each generator panel contains one four-pole double-throw oil switch. These are of the very latest design, breaking all the high-tension currents under oil. There are two ammeters, one in each phase, voltmeter plugs, and receptacles. The feeder panels contain oil switches, ammeters, and Stillwell regulator for each feeder circuit. The arc lighting panel contains ammeter, oil switch, etc., for the control of the arc lighting system. The board also contains all recording instruments for the measuring of power.

There is a motor-booster set installed for assisting and charging the battery. It consists of a 500 volt, 925-r.p.m. Westinghouse shunt motor, directly connected to the booster and the booster exciter. The booster and exciter are of the usual standard Westinghouse type. The storage battery consists of 265 cells, and is located in the room adjoining the power-house.

The erection of the power station was carried out by Messrs. Noyes Bros., contractors, of Melbourne and Sydney, and the engineer was Mr. G. Ayres.

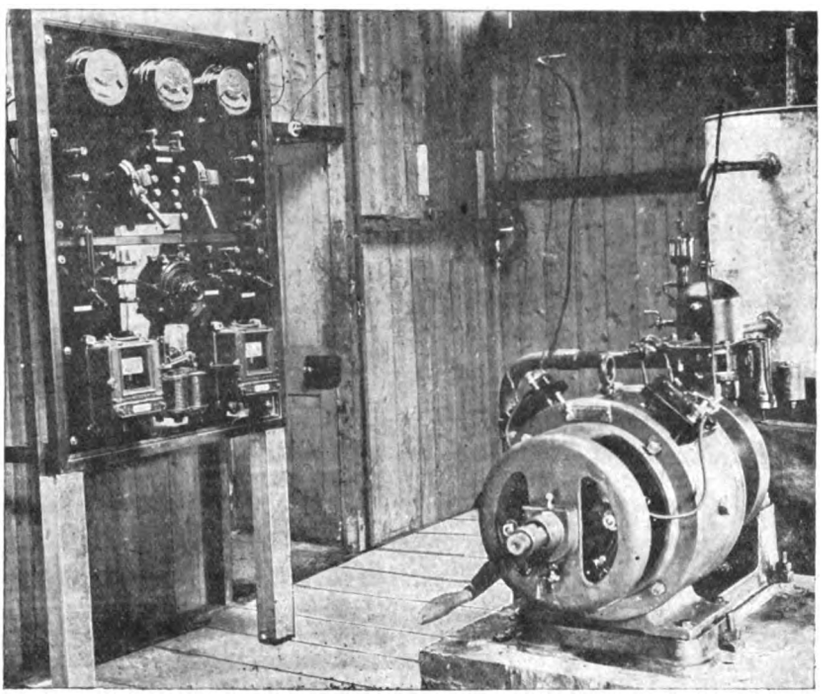
COUNTRY-HOUSE LIGHTING.

The illustration shows a very compact little electric light installation recently carried out by Messrs. R. J. Nicholson and Co., of 26, Cannon-street, Manchester, at a country house in Cornwall. The plant consists of a 55-cell seven-plate section storage battery, a direct-coupled dynamo and petrol engine, and switchboard. The petrol engine is of the two-cycle type, giving 4 b.h.p. at 1,000 r.p.m. The switchboard, which was built by Messrs. Nicholson and Co., is specially designed for installations of this description, and, in addition to the usual instruments, is mounted with a charge and discharge ampere-hour meter. We understand that the firm make a speciality of small country-house plants, for which their type of petrol engine



appears to be eminently suitable. Prices for these engines can be obtained on application.

INSTITUTION OF ELECTRICAL ENGINEERS.

Inaugural Address.*

BY JOHN GAVEY, C B, PRESIDENT.

(Continued from page 665.)

ORDINARY TELEGRAPHS.

In considering the question of ordinary telegraphy, it may almost be appropriate to apply to it the old adage, "Blessed is the country that has no history," if this be interpreted as signifying freedom from subjects of heated debate, or controversial troubles, financial or political, which so frequently retard the development of new enterprises, it being, however, understood to imply steady progress and the full growth that is necessary to meet the requirements of the public and to spread the civilising influences of modern life into the dark corners of the world. Telegraphic statistics have been furnished on previous occasions in presidential addresses and in papers presented to the Institution, and it may not be amiss here to compare former figures with those now available.

First dealing with telegraphs for the use of railways in the United Kingdom, I am able, through the courtesy of the various companies, to submit a table which illustrates the growth since the year 1879, up to which date definite information was supplied in a paper read by the late Mr. E Graves in May, 1880.

* Delivered at the meeting on Nov. 9.

Comparison of Railway Telegraphs in 1879 and in 1904.

	1879.	1904.
Mileage of poles	14,889¼	19,484½
,, wire	62 009½	161,741¾
Number of telegraph instruments	13 128	19 978
,, telephone ,,	Nil.	27.960
,, block ,,	22,411	56,176
,, repeater or signal instruments	11,308	81,682

This table illustrates in a forcible manner the readiness with which our great railway companies avail themselves of the resources for the regulation and safeguarding of their traffic placed at their disposal by the electrical profession, and it is not too much to claim that the comparatively absolute freedom from serious railway disasters in this country is largely due to this wise policy.

Turning to the question of ordinary commercial telegraphy, the following figures may prove interesting:

Telegraphs and Telephones provided by the British Post Office.

	March 31, 1880.	March 31, 1905.
Mileage telegraph poles, underground and cable	25,675	38,032
,, telephone ,, ,, ,,	Nil.	14,898
,, telegraph wire	114,242	338,120
,, telephone ,,	40	253,521
Number of telegraph instruments	12,754	33,267
,, telephone ,,	61	48,118

The growth of the traffic was until recently proportioned to the growth of plant, and although the ordinary telegraph traffic has now been checked by the advent of the telephone, that young and lusty child threatening to monopolise the greater portion of the short-distance work in all countries where it has free play, still for long distances the questions of cost and the physical limitations of the telephone will check the rivalry of the latter, and there appears to be but a small prospect of serious interference or serious competition between the two methods of communication after a certain critical distance is reached. It may be convenient at this point to refer to the general statistics relating to the plant in use for telegraphs and telephones in those countries from which returns are obtainable, and so far as I have been able to gather them, they were represented by the following figures, at the end of the year 1902:

Telegraphs.—Mileage of overhead and underground telegraph wire.

Aerial.	Underground.	Total.	Instruments.
3,433 911	225,748	3,659,659	265,835

Telephones.—Mileage of overhead and underground wire.

Aerial.	Underground.	Submarine.	Total.	Stations.
4,197,416	2,530,215	11,145	7,467,417	3,534,036

The statistics showing the growth of the telephone systems in the United States are, perhaps, the most remarkable. The following table repeats the figures given by Sir

Digitized by Google

William Preece in a paper read before the Institution in 1894, and those which appear in the American Bureau of the census report for 1902:

	1893.		1902.
Mileage of wire	532 256	.....	4,850,486
Telephones in use	276.360	.....	2 315,297
Telephone subscribers	232 140	.....	2,178,366
Number of talks	600,000,000	.....	5,070 000,000
Capital at par	—	.....	348,031,058

The growth from the year 1902 to the present time has shown no signs of diminution, so that it is difficult even for the most skilled experts in the States, or those best acquainted with the general situation, to forecast the ultimate development.

As to the amount of capital expended on telegraphs and telephones, the full facts are not forthcoming, as so much of the plant has been provided by the various Governments which do not keep ordinary commercial capital accounts, but it certainly amounts to hundreds of millions of pounds sterling. A consideration of these facts, however, tends to show that whether in capital invested in plant provided, in staff engaged, or in commercial activity, both the telegraph and its daughter the telephone show no signs of lagging behind the other branches of electrical engineering; and so far as the telephone is concerned, notwithstanding the progress it has made up to the present date, there is every reason to think that we have only seen the commencement of its development in the United Kingdom. Much of its future success depends, however, on the action of local authorities, who will have to show a more accommodating spirit than many of them have done in the past, unless they desire that the constituencies that they represent shall lag behind the remainder of the world in the enjoyment of the facilities for intercommunication that science has placed at their disposal. For these bodies to insist that all telephonic connections shall be laid underground without regard to the number of wires to be provided, to the capital cost involved, or to the fact that long telephone trunk lines must in the present state of our knowledge be provided by means of overhead wires, is to place an insuperable bar to the provision of a cheap and efficient service. In its own interest and for the good of the service which it controls, a telephone administration will always place its wires underground where it is either possible to work its circuits satisfactorily or it is not absolutely uneconomical to do so, but for local authorities to insist on this method being followed in every case simply means either the stifling of the industry or its provision at a cost beyond the reach of the ordinary user. When a corporation has to provide the capital expenditure for public undertakings it takes good care to see that no waste of funds takes place, but when the cost has to be provided by others there is a tendency to make demands that would not be considered in carrying out its own works, the authorities appearing to be oblivious of the fact that the expenditure must be ultimately met in some form by those whom they represent.

If we now consider the actual apparatus by means of which commercial telegraphy is effected, perhaps the most surprising fact that strikes the observer is the predominance of the use of the ordinary Morse code and Morse apparatus throughout the world. At first it seems surprising that, notwithstanding the innumerable inventions of printing, writing, and drawing telegraphs, the original system—of course, much improved—still holds the field generally, notwithstanding the partial use of the Hughes and Baudot printing systems on the Continent of Europe. On consideration, however, it will no doubt be seen that, in comparing the Morse with other systems that at first would appear to be superior, its simplicity, its relative freedom from trouble, electrical or mechanical, the ease with which its alphabet is learned and a skilled telegraphist is trained, and its adaptability to high-speed or multiplex working, all help to maintain it in the forefront, and undoubtedly qualities will for a long time prevent or delay its general replacement by other types of instrument where the speed of working that is necessary is not greater than can be achieved by an operator manipulating a key. Where high-speed automatic Morse apparatus, however, is in use, the want of a means of automatic transcription which would save the labour and delay of manual transcription has long been felt, and extremely promising systems have been devised whereby the problem has been solved in two different ways. In one which was recently illustrated in a paper read before the Institution a perforated slip is used for transmission, as in the ordinary Wheatstone system, but instead of the signals being received in Morse characters at the far end, a second slip is perforated, the exact counterpart of the original; this is placed in an automatic typewriter, which prints the message on ordinary typo. Two different methods of applying this system are now under the consideration of the Post Office. In others the transmission is effected by means of a perforated tape, the message, however, being printed by the receiving instrument, either by a direct impression from a type-wheel, or in one case by a photographic reproduction of each letter as the type-wheel revolves.

It is interesting to note how the practice in the ordinary telegraph service has materially benefited by the development of other branches of applied electricity. Thus for testing and localising faults, and in order to obtain control over the large mass of wires entering the principal offices in this country, these were formerly attached to screw terminals fixed in a test box, which was bulky, and which occupied much valuable space in a costly building. The practice in the Post Office now is to terminate these wires on telephone jacks, and to provide for connections for testing, crossing, or other purposes by means of plugs and flexible cords, the modern arrangement only occupying one-third the space of the old type. Again, the extended introduction of secondary cells charged from lighting plant by means of motor-generators has resulted in the last few years in the abolition of about 150,000 primary cells in the Post Office service, this change leading to a proportionate saving of space, and to a great economy in generating energy and in upkeep. Again, the great extent of modern London necessitates a very considerable amount of local telegraphic traffic. The number of inter-metropolitan messages — viz., those from one part of London to another—some time ago amounted to 18,000 per diem. These were all retransmitted at the Central Office, for it was obviously impossible to provide direct connecting wires between every one of some 600 telegraph offices. The Post Office therefore determined to revert to the system of switching lines through to one another as required, a method which had proved a failure when tried on long and costly trunk circuits, as these could obviously deal with a much larger percentage of traffic when a constant stream of messages was fed into them than was possible when switching connections had to be made. Where local circuits are concerned which are short and inexpensive, and in the majority of cases not filled with traffic, the conditions are altered, and it is a wise policy to increase the number of wires where necessary and to save the delay and cost of retransmission. A special switching board based on telephonic lines was therefore designed to meet telegraphic requirements, and a section providing for 138 lines was fitted up at the Central Telegraph Office and brought into use experimentally on Nov. 13, 1902. Now any office connected to the switch which wants to communicate with another similarly connected merely calls the latter, and the switch clerk, hearing the call, simply joins the two lines through in the manner adopted for telephonic service. Suitable signals are provided to indicate when lines are engaged, and the number of wires to important offices has been increased. In designing the arrangement provision has been made for working all the wires from a secondary battery installed in the Central Telegraph Office, so that the large number of primary cells previously installed in each office has been dispensed with. The result has been so satisfactory that the whole of the metropolitan circuits are now being treated in a similar manner, and this handling of 18,000 messages twice over each day is about to be entirely obviated.

In submarine cable work the same progress may be noted as in other branches of telegraphy. The growth in half a century is represented by the following figures:

1852	87	nautical miles.
1892	139,594	" "
1902	212,894	" "

and it goes on without interruption.

Digitized by Google

Types of submarine cable have in practice not been materially changed, and with the one exception of the air-spaced submarine cable designed for telephone purposes by Mr Willoughby Smith, one of which was laid by the Post Office between Nevin, in North Wales, and Newcastle, in Ireland, in the year 1892. The problem of devising submarine cables for long-distance telephones is, however, still to be solved. The longest telephone cable of the old Paris type was laid by the Post Office in the year 1902 for communication between London and Brussels. It is 47 knots in length, and this is about the practical limit of distance over which satisfactory telephonic speech is possible under existing conditions when allowance is made for the addition of the connecting land lines and of the local subscribers' plant.

As one of the results of cable enterprise, it may not be inappropriate here to refer to the extended knowledge of the character and constitution of the sea bottom which has been derived from the extensive soundings and surveys that have been made in the Atlantic and Pacific Oceans, preliminary to the laying of deep-sea cables. On a reference to Admiralty charts, the track of deep-sea cables can be followed along the continuous lines of soundings at short intervals which appear where cables have been laid, whereas other portions of the sea bottom are comparatively uncharted. I have especially in mind some of the admirable charts and reports prepared by Mr. R E. Peake in connection with cable enterprises with which he has been associated.

Wireless Telegraphy.

Wireless telegraphy—so called—has attracted a great deal of intermittent attention for many years past. The various possible methods of communication between two localities not directly connected by wire may be divided under five heads: (1) leakage across the earth or water between two parallel wires erected on opposite sides of a position which has to be bridged; (2) electromagnetic induction between coils placed vertically or horizontally; (3) the combination of the two above systems by the erection of two parallel overhead wires connected to earth at their extremities; (4) electrostatic effects from vertical conductors; (5) the Hertzian system.

Many attempts have been made to establish communication across rivers, arms of the sea, etc, by the first method, and they have met with varying success, but the system is one the application of which has a limited scope. The second method has but a limited range; it has only been rendered possible by the use of telephones, but inasmuch as the effective energy available for signals diminishes as the cube of the distance between the coils, the limit beyond which no signals can be received is very rapidly reached. The third method, which, prior to the invention of the Hertzian method, was fully investigated by the Post Office, has met with a certain measure of success, and at the present time there are two installations still at work in this country. One of them connects Rathlin Island with the mainland at Bally Castle, the parallel wires being at an average distance of eight miles apart. The second instance is an installation establishing communication between the Skerries, a series of rocky islets off the coast of Holyhead, with the telegraphic service on Holyhead Island itself. The parallel wires are at an average distance of three miles apart. The latter installation is worked telephonically—*i.e.*, the wires are fitted with telephone transmitters and receivers, and telephonic speech is actually transmitted from wire to wire. The fourth system of communication by purely electrostatic effects without the emission of free waves has not been developed on a practical scale. The fifth, or Hertzian, system has created world-wide interest, and its development in the course of the last few years has been very marked. As is well known, the method is based on the classical researches of Hertz. It was made possible in the first place by the original inventions of the coherer by Branly, improved later by Lodge, and finally developed into a practical system by Marconi.

It may be of advantage to briefly review the gradual development of the art from the date of Marconi's early work. It will, no doubt, be remembered that after a period of experiments, first in Italy, then in this country, a crucial trial was made in the year 1896, under the auspices of the Post Office, across the Bristol Channel, from Lavernock Point, first to the island of Flat Holm, and then to Breamdown, near Weston-super-Mare. At that period, what has by some been termed the "whip-crack method" only had been tried—that is to say, a powerful spark coil was connected, one terminal to the vertical conductor, the other to the earth. This arrangement emits a very powerful impulse which is damped down almost immediately, and it is probably the first single impulse alone which affects the receiver at a distance. Elementary attempts at tuning were made by various experimenters during this period, but the art was not sufficiently developed to admit of any really useful results being obtained. The coherers were probably far too sensitive, and the difficulty experienced in the early days was rather due to their not decohering than to their failing to respond to the electrical waves. In course of time this difficulty was remedied by the use of an oscillating transformer in the receiving circuit, which admitted of the use of less sensitive coherers, and excellent results were obtained, but owing to the fact that every receiver within a certain definite range of a given transmitting apparatus responded to each impulse, and all receivers were affected by all transmitters within range, it appeared at first as though Marconi's attempt to increase the effective limit of his apparatus would tend to restrict rather than to extend the use of the system He and others interested in wireless telegraphy, therefore, turned their attention to the establishment of syntony between the transmitting and the receiving apparatus, and a marked degree of success has attended their efforts This syntony is usually effected by connecting one or more closed oscillating circuits to the source of energy and coupling these either direct or through an oscillating transformer with the vertical antennæ, the closed oscillating circuit and the vertical antenna being in unison—*i e*, having the same frequency. A closed oscillating circuit includes a capacity and an inductance, and, therefore, for each primary impulse a train of waves is generated The first portion of the wave has not such an amplitude as when the whip-crack method is used, but this is more than counterbalanced by the effect of the long train of oscillations, which results in restricting to a great extent the visible effect to receivers tuned in harmony, other receivers not so tuned not responding when a certain critical distance is passed. In the next place, by a judicious combination of oscillating circuits with antennæ of suitable capacity, the amount of energy that can be utilised for the transmission of signals may be increased from the small limits imposed when an ordinary induction coil is used to practically any given amount—an utter impossibility with the original method of working. Of course, where a very powerful exciting system is in use, the radiating surface must be increased proportionately, and the well-known method of multiple antennæ has been designed to achive this end. At the receiving station the tuning is effected by the addition either of inductance or of capacity, the receiving installation being brought into as perfect syntony with the transmitter as is possible. In addition to this, special devices have been introduced in the receiving circuit for the elimination of waves of other periodicities so that even whip-crack transmission can to a great extent be eliminated. The effect of having the transmitting and the receiving apparatus in harmony was shown in an admirable manner by the Post Office experiments, recently carried out and described by Messrs. Duddell and Taylor, which gave graphical measurements of the energy received under both conditions.

The receiving apparatus has undergone many modifications since the original filings coherer was invented. There is, for example, the single-point contact, consisting of a pointed carbon lightly resting on a slightly oxidised steel surface; the Brown radioscope, consisting of a lead electrode resting lightly on a surface of peroxide of lead; the Lodge-Muirhead revolving disc, touching lightly on a mercury surface; the Schaffer, so-called, anti-coherer, consisting of a fine razor slit across a silvered glass surface; the Italian navy coherer, in which one or more globules of mercury are enclosed between carbon and steel contacts—all of which are dependent for their action on imperfect contacts; the bolometer and electrolytic methods claimed by different inventors; and, finally, Marconi's electro-

Digitized by Google

magnetic receiver. Many of these have been associated with variations in the original method of combining the different electrical elements of each circuit, and have been denominated "systems." I will not, however, enter the thorny path of attempted discrimination between those that may be considered as systems or those that can only be described as methods.

A great deal has been said by rival inventors as to the possibilities of wireless telegraphy, and some exaggerated claims have been made on their behalf which have led to counter statements by some interested in other methods of communication. Whilst, on the one hand, it may be fairly assumed that wireless telegraphy is not, under any circumstances, likely to supplant, or even to compete seriously with, inland methods of intercommunication, there is no doubt that there is a very distinct and important sphere of utility awaiting its further development. For intercommunication between ship and shore, and ship and ship, much has been done, although much remains to be done. For intercommunication between neighbouring coasts there is also a possible future, but this depends almost wholly on the further development of the methods of syntony or tuning. There appears to be doubt that in cases in which the wave-lengths used on two systems differ to a considerable extent, a very marked degree of success has been obtained in the avoidance of mutual interference. Where the wave-lengths, however, are not very widely apart in frequency, there is in each case a definite range within which interference arises, and simultaneous working is impossible. That the tuning methods will be improved I think there can be very little doubt. The progress that has been made between the year 1896 when it took a week to receive a few elementary signals over a distance of nine miles, and the present time, when such remarkable results have actually been obtained, is so great that it does not imply the possession of an unduly sanguine disposition if one ventures to predict further improvements, which may be expected to increase the freedom from mutual interference, the speed, and the reliability of this method of communication. It does not appear to be very probable that it will seriously compete with the highly-developed cable communication in the near future, although it may in many instances supplement that service.

(To be continued.)

KING'S LYNN ELECTRICITY ACCOUNTS.

From the accounts of the King's Lynn electricity department for the year ended March 31, 1905, it appears that the total expenditure on capital account to that date amounts to £46,466. Abstracts of the revenue account and balance-sheet, etc., are given herewith.

Revenue Account.

Dr. Expenditure.	£	s.	d.
To generation of electricity	1,519	3	5
Distribution of electricity	672	14	2
Attending and repairs to public lamps	230	7	11
Rents, rates, and taxes	332	6	4
Management expenses, salaries, etc.	364	2	1
Law and parliamentary expenses	22	5	6
Insurances, etc.	33	3	9
	3,164	3	2
Amount carried to net revenue account	3,323	1	6
	£6,487	4	8

Cr. Income.	£	s.	d.
Sale of current per meter	3,753	1	3
Public lighting	1,796	19	11
Under contracts	30	3	3
Rental of meters and other apparatus	178	10	10
Sale and repairs of lamps, etc.	728	9	5
	£6,487	4	8

Balance Sheet.

Dr. Liabilities.	£	s.	d.
Capital account—mortgage debt	37,277	0	0
Sundry creditors	79	0	3
Due to treasurer	4 444	7	5
Surplus assets	8,208	19	2
	£50,009	6	10

Cr. Assets.	£	s.	d.
Capital account—amount expended on works	46 465	19	2
Stores in hand	638	4	9
Sundry debtors for current, meter rents, etc.	1,771	12	4
By net revenue account	1,133	10	7
	£50 009	6	10

Statement of Electricity Generated, Sold, etc.

Quantity generated in B.T.U.			491,629
Quantity sold: Private lighting by meter	145,114		
By contract	2 600		
Public lighting	174,507		446,112
Motors	123,891		
Quantity used on works			11.105
Total quantity accounted for			457 217
Quantity not accounted for			34 412
Maximum supply demanded (kilowatts)			3o1

Number of public lamps: 457 pairs 16-c.p. incandescents, 33 Nernst, 10 arcs.

ABERDEEN ELECTRICITY ACCOUNTS.

Herewith we give abstracts of the revenue account, balance-sheet, etc., from the accounts of the Aberdeen electricity department for the year ended July 31, 1905. The total expenditure on capital account to that date amounts to £236,860.

Revenue Account.

Dr. Expenditure.	£	s.	d.
Coal or other fuel	5,875	11	4
Oil, waste, water, and engine-room stores	473	11	9
Wages at generating station	1,779	8	8
Repairs on buildings	493	1	11
Repairs on plant	934	6	1
Main and service repairs	987	16	8
Meter repairs	67	9	3
Repairs on motors and depreciation	840	9	5
Rents and feu duty	95	4	0
Taxes	3,402	6	1
Management	235	0	0
Engineer's salary (proportion)	513	2	8
General establishment charges	219	11	5
Engineer's travelling expenses	73	8	11
Stationery, printing, and advertising	139	18	11
Insurance	44	6	2
Inspector's wages	77	16	9

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

Post Free, Payable in Advance.)

Bound Volumes of "The Electrical Engineer," *containing half-year's copies, bound in Dark-Blue Cloth, Gold-Lettered, price 8s. 6d. New Volume, January to June, 1905, now ready.*

ENGINEERING ESTIMATES AND THE LOCAL GOVERNMENT BOARD.

Before we leave the subject of the Local Government Board policy, and the method in which their inspectors conduct inquiries respecting loans for extension work, we wish to deal with preliminary estimates of financial results. The inspectors have frequently compared these estimates of profits obtainable with the actual results of working the undertaking in question. As a result, unfavourable comments have been made and doubts thrown on the estimates forming the real subject of the inquiry in question. Commencing from the beginning, a town obtains an electric lighting provisional order, and one or two energetic councillors take up the matter of carrying out the powers of this order. They most likely approach some prominent consulting engineeer and ask him what they ought to do. They usually add that they are not authorised to spend any money on professional advice. The consulting engineer, if a Westminster man, will tell them that he will give them a preliminary report and estimate for a nominal fee of fifty guineas, or even less, which will include his travelling expenses when going to see the town, his report, and, perhaps, an interview with the electric lighting committee or whole council. He will spend one day in the town to get a general idea of the same, but the figures in his report are bound to be based on his experience obtained elsewhere. His estimate of revenue and expenditure for, perhaps, three or four years will be worked out on average figures, and in all the reports we remember seeing a definite price per unit sold is given for each year. The results are, perhaps, very favourable for the third and fourth years, showing a large margin of profit, which will induce the council to go on with the work. So far, so good; but is it fair to compare this preliminary report as to profits with the actual profit obtained? We state emphatically that it is not, and give our reasons as follows. In the first place, it may be that the preliminary report is considered and reconsidered until anything from six months to two years may elapse before the engineer gets instructions to issue specifications for the work. It thus may be three years before supply is started, and three years in the development of electrical engineering shows great alteration in standard practice. The engineer's experience may by then have proved to him that a lower charge per unit in the first instance is really more economical, because it encourages a more rapid development of the undertaking, and does not penalise the first users of electricity. It, of course, means a larger loss in the first year or two, but it is followed by a much wider use of electricity throughout the town. Again, another cause for the variation between estimate and obtained profit is quite outside control of the consulting engineer. He does not have the fixing of the rates, and they may be altered without even consulting him. We know of one case in Lancashire where the horse tramways were converted at a great expense for electric traction. The engineer pointed out that this expenditure was warranted by the lower working cost and probable increase in traffic which would ensue. He said that after the trams had been worked electrically for a year or so fares might be reduced. What happened was this. At the next election, when the conversion was still in progress, a large number of Labour members were elected. These obtained the control of the tramway committee, and their first act was to reduce all the fares by one-half without even consulting the eminent firm of engineers who had the conversion of the tramways in hand. As the electric cars were only running on one or two sections and the traffic was disorganised by the conversion, a heavy loss was incurred at once. The

Digitized by Google

same lines are now working with an annual deficit, after paying capital charges, which could be obviated by a slight rise in the fares now fixed. There are other reasons for variations between estimates prepared often at two days' notice and the results from the working of what may be quite a different system in future years. We have said enough, however, to show that the Local Government Board inspectors are quite beside the mark in drawing conclusions derogatory to the accuracy of engineers' estimates in general from any comparison made with such preliminary reports.

FORTHCOMING EVENTS

FRIDAY, NOV. 17.

Electro-Harmonic Society.—At 8 p.m., concert (ladies' night) at the Holborn Restaurant.

Institution of Mechanical Engineers.—At 8 p.m., the seventh report to the Alloys Research Committee: "On the Properties of a Series of Iron-Nickel-Manganese-Carbon Alloys," by Dr. H. C. H. Carpenter, Mr. R. A. Hadfield, and Mr. Percy Longmuir.

Motor Exhibition.—Olympia.

SATURDAY, NOV. 18.

Institution of Electrical Engineers.—At 10 a.m., students' visit to Chelsea generating station.

Junior Institution of Engineers.—At 2.30 p.m., visit to Messrs. Barclay, Perkins, and Co.'s Anchor Brewery, Park-street, Southwark Bridge.

Northampton Institute Engineering Society.—At 7.30 p.m., lecture on "A Comparison between Gas and Electricity in regard to their Use as Illuminants," by Mr. S. M. Hills.

TUESDAY, NOV. 21.

Tramways and Light Railways Association.—At 12 noon, visit to Motor Exhibition at Olympia.

Institution of Electrical Engineers (Birmingham Local Section).—At 8 p.m., address on "Some Problems in Electro and Electro-Thermal Chemistry," by Prof. R. Threlfall, F.R.S.

WEDNESDAY, NOV. 22.

Society of Arts.—At 8 p.m., lecture. "The Cinematograph and its Applications," by Mr. F. Martin-Duncan.

THURSDAY, NOV. 23.

Institution of Electrical Engineers.—At 8 p.m. (at the Institution of Civil Engineers), "The Applications of Electricity in the Royal Gun Factory, Woolwich Arsenal," by Colonel H. C. L. Holden, R.A., F.R.S.

Tramways and Light Railways Association.—At 8 p.m. (at Society of Arts), "Paving of Roadways," by Mr. W. L. Green.

FRIDAY, NOV. 24.

Physical Society.—At 5 p.m., "The Dielectric Strength of Air," by Mr. A. Russell: "On the Electrical Conductivity of Flames containing Salt Vapours for Rapidly Alternating Current," by Dr. H. A. Wilson; "On the Lateral Vibration of Loaded and Unloaded Bars," by Mr. J. Morrow.

Engineering Standards Committee.—At 11 a.m., conference of glow lamp makers at Institution of Civil Engineers.

Institution of Electrical Engineers (Manchester Students' Section).—At 7.30 p.m., address by Mr. J. Swinburne, M.I.E.E.

Society of Arts.—Nov. 27, at 8 p.m., Cantor Lecture (I.), "The Measurement of High-Frequency Currents and Electric Waves," by Dr. J. A. Fleming. Nov. 29, at 8 p.m., "The British Association in South Africa," by Sir W. H. Preece, K.C.B.

Institution of Electrical Engineers (Manchester Section).—Nov. 28, at 7.30 p.m., "Theoretical Considerations of Feeder Systems," by Dr. W. G. Rhodes, M.I.E.E.; "Street Cable Systems," by Mr. G. J. Watson, M.I.E.E.

Institution of Electrical Engineers.—Dec. 8, at 8 p.m., dinner at Hotel Cecil.

PERSONAL.

Mr. James H. Shepherd has been appointed general manager of Dundee, Broughty Ferry, and District Tramways Co. Five years ago, following the introduction of the electric system into Dundee, he was appointed assistant superintendent of depôts, and for the last 3½ years he has performed the duties of depôt superintendent at the headquarters of the city tramway department.

The South Shields Town Council have appointed Mr. John Wilson to be general manager of the Corporation's new electric tramways at a salary of £250 per annum. Mr. Wilson has been general manager of the old South Shields tramways for 20 years.

The Erith Urban District Council have appointed Mr. A. S. Scott as junior clerk in the electricity department at a salary of 27s. 6d. per week.

EXHIBITION SLAVES.

The Touching Ballad of the Exhibitor's Representative.

[It is generally acknowledged that the late Electrical Exhibition was a huge success, but small reference has been made in the public Press to the share that the hardworked exhibitors' representatives had in this magnificent result.]

Now the Exhibition's ended, what a busy time and wet;
What a lot of solid grafters at Olympia I've met;
Not to mention pretty maidens, some there were in costume blue
Who at making lamps were perfect, and at making matches too.

But the way we slaved was cruel, tho' we did it all like men,
And if ever the occasion comes we'll do it all again.

Oh! the work was simply killing, down before the mid-day chime,
Read the letters from those fatheads at the Works from time to time;
Send them postcards, "Awful busy, very nearly made a sale,"
Meet your *vis-a-vis* at Lyons, hear his latest moral tale.

Yes, the way we slaved was cruel, though we did it all like men,
And if ever the occasion comes we'll do it all again.

In the afternoon came thousands, some were thirsty, hot, and tired,
Ah! the way we worked like niggers getting bottle necks unwired;
Drawing corks and pressing triggers, till it made the fingers ache;
Not to mention keeping gamesters with the guests, for friendship's sake.

Oh! the way we slaved was cruel, but we did it all like men,
And if ever the occasion comes we'll do it all again.

Then to wander through the building, meeting slaves at every bar,
Culling business information, business news from near and far,
Ask how garden chairs are selling at the stand of P.P.P.
While the man in charge goes frantic underneath the plantain tree.

Ah! the way we slaved was cruel, but we did it all like men,
And if ever the occasion comes we'll do it all again.

Then to take a country client for a feed, and when he's wined,
Drink-for-drink him, mixing frequent, till you'd got him nearly blind.
If the blighter had an order for to place, his doom was sealed;
If he would not place it sober, faith, he would when he was keeled!

Ah! the way we slaved was cruel, but we did it all like men,
And I'm sure that when occasion comes we'll do it all again.

For a month we bore it bravely, hour by hour and day by day,
For the honour of our firms until our souls near left their clay.
Now—with feeble pulse some linger, waiting Time's all-healing touch,
Some see snakes and frogs of crimson. Ah! they worked too blooming much.

Oh! the way we slaved was cruel, but we did it all like men,
And we're game to fill the breach next time and do it once again.

THE LONDON COUNTY COUNCIL POWER BILL.

It was decided on Tuesday last that the London County Council should be one of the many applicants for powers to distribute electrical energy on a large scale throughout Greater London. This matter has been referred to before in our columns, but as it has now entered the region of practical politics we reproduce the two reports bearing on it. The first of these, from the Highways Committee, is dated Oct. 23, and reads:

1. We desire to direct the attention of the Council to the very important issues which have been raised in connection with the introduction into Parliament, in the session of 1905, of several Bills dealing on a much larger scale than any brought forward hitherto with the supply of electrical energy in London and certain adjacent districts. The largest of these schemes, that promoted by the Administrative County of London and District Electric Power Company, contemplated the supply of energy, both in bulk and also to large retail consumers, over an area of upwards of 500 square miles. The basis of this scheme was that the company should by agreement, or failing this, by competition with the consent of the Board of Trade, eventually become suppliers of electrical energy in bulk to all the local authorities and companies supplying in London, and in a large area outside London, or else absorb the existing undertakings and carry on the whole service. In the event of the existing supplying authorities not being absorbed, they would "scrap" their generating stations and become retailers or distributors of the energy sold to them in bulk or wholesale by the Administrative Company. At the present time about half London is supplied with electrical energy by local authorities' undertakings, each confined to a single borough, and the other half is supplied by companies whose undertakings are, with a few minor exceptions, compulsorily purchasable by the borough councils in 1931.

This right of purchase by the borough councils which is a cardinal feature of the Electric Lighting Acts of 1882 and 1888, still exists, but its value and practicability have become seriously jeopardised by the character which the companies' undertakings have assumed.

Inasmuch as a single company's undertaking often extends through several boroughs, whilst there is only one generating station, many local authorities will, if present circumstances continue, only be able to buy mains and no station, while others will only be able to buy mains and a station far too large for the needs of a single borough. In some cases, moreover, the stations are outside areas of supply, and, it is contended, not purchasable at all.

We have frequently drawn attention to these difficulties when, on former occasions, schemes much more restricted in character and extent have been put forward. The scheme of the Administrative Company, however, raises these issues in a far more acute form. Had the Bill become law, an enormous monopoly would have been created in the supply of what is now one of the most important and vital factors in the commercial development of London and the neighbouring districts. The danger of such a state of affairs is such that we do not feel it necessary to enlarge upon it now. It will be sufficient to remind the Council that the electrical supply, in common with the water, gas, and tramways services, in most of the large cities in England is in the hands of the local authorities respectively concerned; it being clearly considered that a monopoly in services of this character, which are vital to the welfare of the community, should not be in private hands. It seems clear, however, from the fact that this scheme (although it largely ignored the statutory rights of existing undertakers and tended to the creation of a private monopoly) received the approval of committees of both Houses of Parliament, that those committees must have been convinced that electrical energy was not at the time supplied in a sufficiently attractive and cheap form to meet the needs of manufacturers and others in London and the immediate neighbourhood, and that to enable a satisfactory supply to be given a scheme or schemes on a much larger scale than any then authorised was necessary. A great feature of the case for the Administrative Company's Bill was that existing areas were too small to admit of the generation and distribution of energy on the most economical scale, and, consequently, at the lowest price.

While admitting the proposition that larger areas than several of those at present existing are necessary to secure these ends, we do not feel that it is necessary either to entirely disregard the statutory rights of existing undertakings or to place them in such a position as will make it impossible for them to carry out their service.

What is required at this juncture of the history of the electricity question is, in our opinion, that a complete view of the case should be stated by an authority capable of putting that case before Parliament. Up to the present all that has been attempted has been to deal with the problem separately from the company's standpoint and the borough council's standpoint, which together do not, however, make up the whole case so far as it concerns London. This, for the reasons set out in this report, can, we think, be most adequately done by the Council as the central municipal authority. We have accordingly carefully considered how the advantages aimed at can be gained otherwise than by the creation of a private monopoly, and we have arrived at the conclusion that, having regard to the extent of area necessary to secure economical supply, and to the importance of preserving as far as possible, the existing rights of local authorities and the principle of municipal ownership contemplated by the Acts of 1882 and 1888, the only possible alternative is for the Council to obtain such powers as will enable it to supply electrical energy in London and the neighbourhood, the Council being the only London municipal authority entrusted with an area large enough to allow of generation on the necessary economical scale. The fact that the Council already has a very large generating station to supply electrical power for the tramways of London is, in itself, largely in its favour by rendering possible a load of the most economical character. We would point out, too, that one important objection which was raised in the case of the Administrative Bill was the enormous powers that would be conferred on private individuals in respect of the breaking up of streets and the interference in other ways with public property. It seems obviously desirable that such extensive rights as would have been conferred in regard to public property should be in the hands of a public authority, and, moreover, as the Council is itself from time to time laying electric mains in all parts of London for tramway purposes, considerable convenience and economy of work would be gained were the two services in the Council's hands. In addition, there is the fact that the Council is already responsible for the conduct of very large services involving the consumption of such similar stores and the formation of such similar organisations as would be necessary for the supply of electrical energy. In view, therefore, of these considerations of economy, and also the importance of retaining in public hands the control of a service so essential to the development of London in the future, we believe that the Council will think it right to seek powers to enable it to supply electrical energy as proposed. The authority to be sought should, we think, include power (1) to supply energy in bulk throughout the whole of the area in question, and (2) to supply energy to large individual consumers, as, for instance, railway, canal, and tramways companies, or authorities where these undertakings extend over more than one area.

We have not at present gone fully into the details of a definite scheme for the supply of electrical energy, but, from reports which we have had before us, and having regard to the favourable position in which the Council stands in many respects, we are of opinion that it will be quite practicable to put forward a satisfactory scheme, bearing in mind the importance of providing cheap electrical energy for general use in London, and at the same time securing continuity of the policy of public control which was intended to be ensured by the purchase clauses of the Electric Lighting Acts of 1882 and 1888.

The Council on Oct. 24, 1905, authorised us, with the Parliamentary Committee, to confer with representatives of the London local authorities upon the whole question of the supply of electrical energy in London. It is proposed to hold this conference on Monday, Nov. 20, 1905, and we will then place our proposals, in the event of the Council adopting them, very fully before the local authorities. In the meantime, however, we have thought it right, having regard to the short time available for the issue of the necessary parliamentary notices as to the deposit of a Bill, etc., to place before the Council this outline of the policy which we recommend it to adopt. We have, as required by standing orders No. A 27 and A 161, informed the Finance and Parliamentary Committees of our intention to recommend the Council in this sense. It is, however, necessary for us to ask the Council to suspend the operation of standing order No. A 161, which requires that all proposals relating to applications to Parliament for powers shall be submitted to the Council not later than its first meeting in June of each year. We think that this is clearly a case of urgency, which comes within the class contemplated by standing order No. A 162, inasmuch as it was not until August that it was known that the Administrative Company's Bill would not pass. We have consulted the solicitor, in accordance with standing order No. A163 and he is of opinion that the Council has power to promote legislation in the direction indicated, provided that the provisions of the Borough Funds Act, 1872 as applied by the County Council's (Bills in Parliament) Act, 1903, are adopted. We recommend:

(*a*) That the operation of standing order No. A 161, relating to the time for the submission to the Council of schemes involving application to Parliament, be suspended, in order that the following recommendations may be considered.

(*b*) That authority be sought in the session of Parliament of 1906 (1) to enable the Council to supply electrical energy in London and certain surrounding districts on the lines indicated in the report of the Highways Committee, dated Oct. 23, 1905; (2) to confer upon the Council power to carry out any necessary works, including the erection of buildings, the laying of mains, etc., necessary to give effect to such powers; (3) to empower the Council to make arrangements with local authorities and others having power to supply electrical energy, and to enter into agreements to give effect thereto; and (4) to confer upon the Council any general powers which may be necessary to enable it effectively to supply electrical energy.

(*c*) That the costs and expenses of promoting the legislation referred to in the foregoing resolution be defrayed out of the county fund.

(Signed) FITZROY HEMPHILL, Vice-Chairman.

The second is from the Finance Committee advising that the matter should not be proceeded with. This is dated Nov. 8, and reads:

1. The Highways Committee are recommending the Council to promote a Bill in the next session of Parliament to enable the Council to supply electrical energy in London and certain surrounding districts, and it devolves upon us under standing order No. A 27 to report upon the financial bearings of the proposal. The authority to be sought includes power (1) to supply electrical energy in bulk throughout the whole of the area in question, and (2) to supply energy to large individual consumers, as, for instance, railway, canal, and tramways companies, or authorities where these undertakings extend over more than one local government area.

In considering this most important proposal we have found ourselves in a position of great difficulty owing to the absence of any financial data to guide us in advising the Council. Time has not permitted a definite scheme to be worked out by the Highways Committee, and their report to the Council only outlines in very general terms the proposals which they recommend the Council to place before Parliament.

We are strongly of opinion that in a matter of this magnitude,

Digitized by Google

raising financial issues of the greatest importance, the Council should, before committing itself to the undertaking, have before it a definite and carefully-worked-out scheme.

In the absence of any such scheme we have given such consideration to the subject as time and the limited amount of information at our disposal have allowed. The two main questions on which the Council will naturally desire to have our advice are: (1) Are there reasonable grounds for thinking that the enterprise will be self-supporting? and (2) Can the large sum of capital required be raised without affecting the credit of the Council?

The first of these considerations is one of vital concern, for we cannot suppose that the Council would agree to invest some millions of public money in an undertaking of this kind without substantial reasons for the belief that it would be at least self supporting—in other words, that the profit on working would be sufficient to pay the interest on, and provide for the repayment of, the money borrowed. The credit of the ratepayer would in any case be pledged for the raising of the capital; but the Council will no doubt agree that beyond this no further assistance should be looked for from the rates. The Council will note that the report of the Highways Committee offers no guidance upon this matter beyond the general statement that in the Committee's opinion "it will be quite practicable to put forward a satisfactory scheme."

In these circumstances we have endeavoured to assist the Council to a conclusion from a consideration of the estimates and financial data placed by the power company before Parliament last session in support of their scheme, with which the Highways Committee's proposals are in a measure comparable. We desire to distinctly disclaim any acceptance of the company's estimates and calculations, but we think it may be useful to the Council to have some of these materials before it.

The power company proposed to supply a very large "industrial" and "non-industrial" area, of which no less than 75 per cent. was outside the county of London. Capital powers to the extent of £6,600 000 were sought by the Bill, and the initial capital expenditure to complete the first station of 60 000 kw., distributing mains, and subsidiary works was put down at £2,100,000, the total capital expenditure up to the completion of the undertaking being estimated at £6,600 000, including £100 000 for "preliminary" expenses. The company sought powers to supply existing undertakers (borough councils and companies) and large undertakers—*e.g.*, railways, docks, etc.—throughout their area, and also in the "industrial" area manufacturers and other power users *direct* with the consent of the existing authorised undertakers, provided that if that consent were unreasonably withheld an appeal could be made to the Board of Trade. The company estimated that they could generate electricity at the low price of ·154d. per unit, a figure which, adding general and other expenses, worked out to ·522d. per unit sold, and that with a sale of 133,500,000 units by the year 1910 at an average price of ·7d. there would be a balance, after providing for reserve, depreciation, and renewals, sufficient to pay 5½ per cent. on a capital of £2 000 000, and, further, that with a sale by the year 1916 of 600,000,000 units at ·55d. there would be a balance sufficient to pay

4½ per cent. on £1,000,000 debenture stock	£45,000
5 per cent. on £2,000,000 preference stock	100 000
8 per cent. on £3,000,000 ordinary stock	240 000
Total	£385,000

and to carry forward about £38,000.

These figures related to the company's entire area, of which, as above stated, the greater part was outside the county of London; the company gave no figures for the county of London separately.

It is, to say the least, doubtful whether the profit estimated by the company could have been obtained.

Whether the above estimates were well founded or not, it appears to us that they are deserving of the Council's attention, particularly in view of the fact that any practical scheme put forward by the Council will inevitably be compared with these figures.

The Highways Committee do not say what capital would be required, but we have assumed that a sum of about £3,000,000 would be required *in the first instance* for a large generating station with mains and subsidiary works. The expenditure of this money would be spread over five or six years, and it is obvious, therefore, that there must inevitably be a long period during which the capital would be unremunerative. The power company proposed to meet this difficulty by obtaining power to pay interest out of capital at the rate of 3 per cent. up to a maximum of £310 000. There is no precedent for a municipal body being given such a power, and we must assume, therefore, that the interest on the capital raised would have to be defrayed out of the rates year by year. We estimate that for interest payable on a sum of £3,000,000 during the construction of the works an aggregate sum of about £380,000 would have to be so provided. This is a consideration which we do not think the Council has sufficiently appreciated in the past. There are precedents for the postponement for a few years of the sinking fund provision, and we have therefore assumed that no charge under this head would fall upon the ratepayers of the earlier years.

The ultimate debt charges, assuming that the expenditure on land and buildings were spread over 60 years, and the cost of machinery, trunk mains, etc., over 25 years, may be taken roughly at about 6 per cent., which, on an initial outlay of £3,000,000, would represent an annual charge of £180,000 a year.

What the Council has to consider is the probability or otherwise of the undertaking showing a profit on working sufficient to produce this amount.

The power company calculated on a total output for their entire area of 133,500,000 units in five years' time, and on 600,000,000 units in 11 years' time, when the works would be completed.

We find that the output of the existing undertakers in London in 1903-4 was as follows:

Companies	85 933 026 units.
Borough councils	27 963 137 ,,
Total	113,896,163 ,,

On the basis of the power company's calculations it would be necessary for the Council to sell upwards of 200,000,000 units at an average of ·7d. per unit in order to realise a profit on working of £180 000 a year, even if the working expenses should prove to be not higher than those estimated by the company, and if the same provision is made for renewals and reserve.

It is difficult to compare the proposals foreshadowed by the Highways Committee with the power company's scheme for various reasons. In the first place, the proposed area of supply has not yet been determined by the Highways Committee, but we gather that it would include a large district outside the county of London. This is an important point, because the existing conditions of the electric supply in London, and the extent to which existing undertakers are providing therefor, appear to us to render it extremely probable that a scheme of supply limited to the county would not allow of a sufficient output for production at the lowest possible cost. On the other hand, there are obvious difficulties in the way of the Council obtaining powers of supply outside the county of London, and the wider area would largely increase the amount of capital to be provided, and add greatly to the Council's responsibilities, for whatever financial risks there may be in the undertaking would fall entirely on the ratepayers of the county of London.

It is not clear from the proposals outlined in the committee's report whether the Council would be able to supply power direct to individual manufacturers, or only, with certain exceptions, to supply through existing undertakers. The Council is aware that the power company sought powers, with the consent of the Board of Trade, to supply directly to the manufacturers, with the object, no doubt of securing thereby a lever to force the distributing undertakers either themselves to supply the manufacturer at or about the prices offered by the power company, or to accept a bulk supply from the power company. It appears to us that this matter has an important bearing on the probable amount of business for which the Council might look.

Again, the Highways Committee are not yet in a position to estimate the amount of support which the Council would be likely to receive from existing undertakers (companies and borough councils), and until some information on this point is forthcoming, it appears to us undesirable for the Council to commit itself.

Turning now to the other consideration which has occupied our attention, we feel it our duty to state to the Council that we view with apprehension the large addition to the Council's capital commitments which this undertaking would necessarily involve. As the Council must be aware the question of the extent of its commitments, particularly in their bearing on the amount of money which will have to be raised on loan during the next two or three years, has for some time past been a matter of growing concern to us. We desire to impress upon the Council the fact that, however good its credit may be, if it were to force larger loans on the market than the investing public could readily absorb, the Council would inevitably have to be content with a lower price for its issues of stock, and this would particularly be the case when the general conditions of the money market are not altogether favourable for such issues. The effect of such a course would speedily prove detrimental to the Council's credit, and in our opinion the Council should so limit its capital expenditure as to obviate the necessity for making undue demands upon the money market. The time has, in fact, arrived when the Council must, in our judgment, select from the objects of expenditure which it is being pressed to undertake those which are necessitated by its present statutory duties in order that its general financial position may not be prejudiced.

The Council is at the present time engaged in carrying out several great improvements and works involving a large amount of capital expenditure, and during the present year it has decided upon the immediate electrification of the whole of the northern system of its tramways, and this with various extensions and other reconstructions will necessitate a far larger capital expenditure on tramways during the next few years than in any past year. Again, the acquisition of a site for the new county hall has been approved, and provision for this, together with the building, will make a serious addition to its normal requirements on capital account. In these circumstances and apart altogether from the consideration of the risk which the proposed scheme involves, we think the Council should endeavour to find some solution of the problem which would not involve the raising by the Council of large sums of capital in the near future. The report of the Highways Committee does not discuss any alternative policy by which the evils which might result from the creation of a virtual monopoly with wide powers might be obviated, as, for example, the introduction in the power company's Bill of adequate safeguards in the form of a purchase clause, sliding scale of price, and dividend and other similar provisions. We merely refer to this aspect of the subject in order to point out that there are alternative methods of dealing with the difficult situation which has been created by the general recognition of the changed conditions under which electrical energy must in future be generated.

In conclusion, we desire to impress upon the Council the fact that the enterprise to which it is being asked to commit itself is one which, from its nature and from the possible developments of electrical science, is of a somewhat uncertain character, and that the Council is being asked to commit itself without any figures before it showing that the undertaking would be made self-supporting. We are, moreover, of opinion that the Council should be further guided in this matter by its financial position, and that it should not largely extend its financial engagements during the next few years beyond those already entered into.

(Signed) WELBY, Chairman.

After a lengthy debate on Tuesday last, the amendment to refer the matter back to the Highways Committee was rejected by 79 votes to 36

Sir Francis Mowatt then moved that the following amendment be added to the recommendation: "Provided that, before the introduction into Parliament of any Bill, opportunity shall be afforded for full discussion in the Council of its provisions, especially as they affect the financial consequences of the scheme."

The amendment was carried, and upon a division the recommendation as amended was agreed to by 79 votes to 32.

OPENING ADDRESS TO THE DUBLIN SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS.*

BY P. S. SHEARDOWN, MEMBER, CHAIRMAN FOR SESSION.

(Concluded from page 674).

Storage Batteries as an Adjunct to Central-Station Equipment. The writer (G. Gaettling) remarks that only a few years ago station engineers were strongly averse to the use of batteries as being unnecessary and complicated, but that now many engineers considered that a reliable service could not be given without them. In a table showing the increase in kilowatt-hour capacity of central-station batteries he notes that in 1894 two stations only had batteries, the total capacity being 938 kilowatt-hours. In 1904, 22 generating stations, 68 sub-stations, and 8 exciter batteries had been installed, with a total capacity in kilowatt-hours of 124,211; 95 per cent. of these storage batteries had been installed by one firm of makers. He claims that battery rooms should be located close to the switchboard room to save voltage loss and to keep the cable connections short; that it is unwise to erect batteries so that inspection cannot easily be made; that the floor of a battery room must be both acid proof and fire proof, and states that a flooring in vitrified brick on a layer of 6in. of concrete is most satisfactory, and that the bricks be grouted in with hot pitch. Cells should be installed in one tier, as a double-tier installation is difficult to inspect. Battery tanks should be placed on double insulators to prevent leakage. With regard to plates themselves, the positive consists of a rigid conducting support, holding in place soft lead formed into small buttons of coiled ribbon, with corrugated surfaces, these buttons extending slightly beyond the surface of the hard metal support or grid, as it is technically called. These plates have been found to stand very satisfactorily the excessive demands that the storage battery is called upon to meet. The development in the negative plate has kept pace with that of the positive plate. The negative plate now consists of a hard metal supporting grid, in which the various sections of active material are securely held in place by means of a thin covering of perforated sheet lead. The advantage of this plate over all other types lies in its strong mechanical construction, in its greatly increased life, and its ability to maintain its capacity throughout a long period of use. A still further development, and a most important one, is the substitution of thin wooden diaphragms between the plates as separators, in place of the glass tubes heretofore generally used. This new type of separator is superior, in that it effectively prevents any possibility of short-circuits forming between the plates, thus keeping the cells in uniform condition, so that the amount of work in operating the battery is reduced materially, and the proper relation of charge to discharge maintained more economically—all of these features combining to effect a very considerable increase in the life of the plates.

In the discussion surprise was shown by the English engineers that the value of the reversible booster seemed to be unknown in America—they did not appear to appreciate how much the life and upkeep of a battery depended on the life and cost of upkeep of the regulating cells; that in America they were still using the old end cell regulation, whereas in England they were gradually introducing a fixed number of cells and booster regulation. It was also shown that, whereas in America the system of maintenance by contract had been practically abandoned, in England it had become almost universal and worked out at about 7·5 per cent. per annum of the original cost, and for that amount those who guarantee the battery have to keep them up to 100 per cent. capacity; one advantage claimed for this maintenance system being that the guarantor insisted on certain tests and inspections being made which in actual practice tended to increase the life of the battery. The American life seemed to be that they placed so much importance to and faith in their storage batteries in the cases of emergency, that they did not like to run the risk of impairing their reliability by coupling to them a piece of rotary machinery which they claim might be an element of failure, and they stated that, owing to the fairly steady load that they had on their batteries, the regulating coils had not given them much trouble. The splendid results obtained with wooden separators were emphasised, the capacity of the batteries having been increased very much since these boards were installed. The boards affected only the negative plates, it having been proved that after a short time in use the negative plates gave only 80 per cent. of their guaranteed capacity, but that, after this board diaphragm had superseded glass separators, in three weeks' time they could get from 110 to 115 per cent., so the life of the negative plate is increased by at least two years.

Storage batteries are very largely used in the States in the sub-stations in electric railway service, and in J. B. Entz's paper on this subject the following points are brought out: That although the efficiency of a storage battery may not be high compared with other forms of electrical machinery, that the batteries deal satisfactorily with the portion of the load which is least economical for the generating or transmitting apparatus—that is to say, that the peak load which occurs occasionally, and with the light load experienced during the night, when with storage batteries steam plant may be entirely shut down. With regard to the efficiency, the writer states that with batteries used very considerably on peak work their output will amount to from 15 to 20 cent. of the total output of the station, and as the battery under average conditions will not be fully discharged, a certain portion being held in reserve to meet abnormal conditions, the efficiency of the battery will be high. Taking this at 85 per cent. as a minimum, he finds that the loss in the battery where their output is 20 per cent. of the total is 3 per cent. of the total output of the system, and that it is safe to assume that on account of the improved efficiency in transmission and the improved load factor on the rotaries that the efficiency of the sub-stations would be increased considerably more than this amount, and that any improved economy in generation of power at the main power-house will be net gain. As to the construction of a battery for such service, it is pretty well established that the positive plates should be of the Planté type and not of the pasted type, while the negative type are preferably of the pasted type. The characteristic trouble of negative plates has been loss of capacity due to shrinkage of the spongy finely-divided active material into a denser and less porous material. This has been practically true of Planté negative plates where the active material is relatively small in quantity, and has been reduced from the peroxide previously formed from the plate itself. A process has been discovered of manufacturing a negative active material which always retains its loose spongy porous condition, but as this has but little mechanical strength, means have to be provided in the plate for retaining it in position; such plates have proven eminently satisfactory in service, and extended tests show very great increased life and the maintenance of low resistance and low polarisation factors.

A very interesting paper was given by Mr. Alexander Dow on the direct-current distributing system of American cities. The general system of distribution in large American cities is a three-wire, direct-current, low-pressure system, the potential across the outers usually being in the neighbourhood of from 210 to 220 volts. As you are aware, this is quite different from the system usually employed in distribution in English and Continental systems, where, if alternating distribution is not installed and the direct-current system employed, the pressure across the outers is usually from 440 to 500 volts; and Mr. Dow gives evidence in favour of the low-pressure system originally installed, and still adhered to in large American cities—meaning cities of a population of 250,000 or upwards. Originally in America the current was produced as direct current, the stations being comparatively close together and feeding right into the network, each engine driving a pair of generators, as it is not customary there to depend upon the balancers or upon a storage battery for balancing the load on a three-wire system, although storage batteries are often used for auxiliary or reserve sources of current. With the increased demand for electrical power the system of generation has changed, and most of the large cities have one, or at most two, large generating stations situated outside the area of distribution and transmitting power in the form of three-phase high-pressure current to sub-stations. But at the sub-stations, by means of either rotary converters or motor-generators, the current is converted to direct current and supplied at low voltage to the original three-wire distributing network. It is generally claimed that by doubling the voltage on a three-wire system, as has been practically altogether done in England, you double the amount of power that can be sent through a network of given sized cables without any increase in the resistance losses; but the author argues that on their system it simply tends to the multiplication of sub-stations and a comparatively small increase in the amount of high-tension feeder cables required, and argues that the amount of generating machinery required with either system is the same, and that the increased expenditure in dividing up the converting machinery into a comparatively large number of units so as to feed at many

* Delivered on Nov. 9, 1905.

Digitized by Google

different points into the network is not a very costly matter, as many of the sub-stations are only required to be run during the period of heavy load, and that, therefore, the increased wages is not an important matter. He also argues that by this means they can regulate the voltage in all parts of the distributing network with a minimum amount of variation, which means that they can use very much higher efficiency lamps than is possible where the high-voltage lamp is used on a large network fed into at points long distances apart. The custom in the States is for the supply and maintenance of the lamps to be included in the price charged for current, and that, therefore, it is a matter of great importance to them first of all to operate a lamp which requires a small consumption of energy; and, secondly, to have a lamp that will give a long life before breakage of the filament or loss of power makes it necessary to renew. Their standard lamp is 16 c.p. operating on 3·1 watts per candle. The author thought that by working with a high-efficiency lamp they had a saving in current of about 20 per cent., and rather pertinently remarked that the object of a lighting company should be to supply light, and not electrical power, at the cheapest possible rate to the consumer. With the 3·1-watt lamp referred to they were able to realise an average life of over 470 hours per lamp before the candle-power was reduced by blackening to 80 per cent. of the initial candle-power. Five per cent. of all the lamps manufactured for them are selected at random before being packed and tested for watts per candle at the rated voltage, and out of this 5 per cent. one-tenth are given a continuous life test, being run at marked marked voltage until the candle-power has fallen to 80 per cent. initial value. With regard to alternating current, although it has the advantage of requiring less cost for plant in the sub-stations, and a smaller amount of attendance than rotary converter apparatus, he claimed that with a mixed system of lighting and motors (the latter being largely used for lift service), the power factor would seldom be higher than ·9 and frequently lower than ·8, which would mean larger generating plant and larger mains, and naturally this low power factor means still greater difficulty in voltage regulations.

Steam-Turbines. — Several important papers were read on steam-turbines, which, in view of the great advances this type of prime mover has made of recent years, naturally commanded a good deal of attention. The first paper was by Mr. W. R. L. Emmett, who has been largely responsible for the development of the Curtis steam-turbine as manufactured by the General Electric Company. He first of all drew attention to the fact that a much smaller building was required where steam-turbines were installed than was the case with low-speed reciprocating steam-engines, mentioning that if the full advantage of the steam-turbine was to be realised, the station should be designed with this special feature in view. With regard to efficiency, he admitted that up to the present the best class of steam-engine had attained results under favourable conditions quite as good as had been obtained with the steam-turbine, with the following difference—that in the case of an ordinary reciprocating engine the greatest difficulty was attained at one given load, but that the efficiency fell off very rapidly either when unloaded or overloaded, which was a very important point, because, especially in the case of ordinary generating stations, it was very hard, indeed, to keep an engine loaded with a constant steady load, but in the case of the steam-turbine the variation in efficiency at half load and 25 or 30 per cent. overload was very nearly as good as at the load for which the turbine was designed to run with maximum efficiency. The energy available in expanding 1lb. of steam from a pressure of 150lb. to a vacuum of 29in. is 27 per cent. more than if expanded to a vacuum of 25in., yet the efficiency of the modern reciprocating engine is only improved by 1 per cent. if the vacuum it discharges into is increased from 25in. to 29in., because the best engines open the exhaust at a pressure of 7lb. to 8lb. absolute, and consequently lose a large proportion of the expansive force of steam below that point, the degree of vacuum below the point of exhaust only serving to diminish the back pressure and not employing an effective expansion to the vacuum point. The reason of this is that as steam expands to low pressure the volume increases in a rapidly increasing ratio, and this increase of volume is so great that it soon passes the limit of capacity for which cylinders can be profitably designed. There is thus a large proportion of the valuable energy due to the expansion of the steam which cannot be used in reciprocating engines, and which must be lost in the form of heat in exhaust steam. The steam-turbine possess the inherent advantage that it can be designed to work effectively to very high degrees of expansion in the steam; since the steam in the turbine is not confined to chambers where it must exert pressure, it is available for doing work as long as it possesses expansive force capable of imparting an effective velocity to the steam itself. Thus the steam-turbine operates in a larger field of theoretical possibility than does the steam-engine, and that it is not at present more efficient is simply because its development on a large scale has been confined to the past four years, and that it, therefore, has not had as much time and trouble spent on experimenting with it as has been done with the steam-engine, which has been so much longer in the field. The writer dealt on the fact that condensing plant capable of maintaining a high vacuum was of much more importance with steam-turbines than with reciprocating engines, but stated that, owing to the construction of the former, it was easier to prevent air leakage. He then drew attention to the great increase in efficiency which could be obtained with existing steam plant by arranging for them to exhaust into a low-pressure turbine, driving a generator working in parallel with the plant driven by the reciprocating engine and then allowing this turbine to exhaust into a high vacuum. He claims that the turbine designed for operating under these conditions would be an ideally simple affair, and its maintenance and care would add little or nothing to the cost of station operation, there being many large stations in which the introduction of such turbines with proper condensing facilities would increase the output as much as 30 per cent. without any increase of the fuel consumption or change in the boiler plant. The turbine should be arranged to receive steam at about 8lb. pressure absolute corresponding approximately to the pressure when the exhaust valve opened in the low-pressure cylinder of the engine. The engine would then handle all the power which it could develop with maximum efficiency, and its own output would be only slightly reduced, and the turbine would develop the power to which the engine was not well adapted. The cost of installing such turbine with complete condensing facilities would not exceed £12 per kilowatt of capacity added to the station. Another application of the steam-turbine which promises a considerable degree of economy is by its use utilising the waste heat from gas-engine installations.

The best gas-engines (according to the author) turn about 20 per cent. of the heat of the fuel into useful work, the remainder is lost either in the exhaust gases or in the heating of the water used to jacket the cylinders and other parts. It should be possible to pass the exhaust gases through the tubes of low-pressure boilers fed by hot water which had passed through the jackets of the engines. The boilers would deliver steam to simple low-pressure turbines with suitable condensers; in this manner 30 per cent. could easily be added to the power developed by the gas-engine without increasing the gas consumption.

Another paper (Francis Hodgkinson) of great interest dealt with steam-turbine performances, some valuable information dealing with actual tests made on Westinghouse-Parsons steam-turbines being given. The tests on a 750-kw. turbine showed that when running with a boiler pressure of 140lb. non-condensing, and with no superheat, the consumption per brake horse-power hour at full load was 28·26lb., but with the steam-turbine running on a 28in. vacuum, boiler pressure 150lb., superheated 100deg., the consumption was reduced to 12·38lb. On another 750-kw. turbine, boiler pressure 150lb., vacuum 26in., superheat 150deg., at full load the consumption was 13·18lb. per brake horse-power hour, but with similar conditions except that the vacuum was increased to 28in., the consumption was reduced to 11·79lb. In another 400-kw. turbine it was found that when operating with 150lb. boiler pressure, 28in. vacuum, and dry superheated steam, the consumption at little over full load was 13·89lb. per brake horse-power hour, but by superheating 100deg. this was reduced to 12·48lb. With regard to the efficiency over a wide range of load, this consumption of a 750-kw. turbine was given at ·479 per cent. of full load as 13·85lb. of steam per brake horse-power hour; at full load, 11·79lb. of steam; at 24 per cent. overloaded, 11·42lb. of steam; and at 41 per cent., 11·5lb. per brake horse-power hour.

In a paper on aluminium as an electric conductor the following points were brought out by H. W. Buck: That at the present its electric utility is practically confined to (A) 'bus bars in power stations; (B) high-tension overhead uninsulated conductors; (C) low-voltage feeders, usually insulated with weather-proof braid only. It is debarred from use in a number of cases on account of the practical impossibility of applying the ordinary methods of soldering. At the present relative cost of the two metals, aluminium is about 10 to 13 per cent. cheaper than copper of the same resistance. Aluminium, owing to its low conductivity, and necessarily greater diameter, makes it more expensive for use on cables where costly materials are used for insulation. Aluminium wire is not suitable for telephone work on account of its coefficient of expansion and its comparatively low tensile strength, which causes a greater sag at high temperatures than in copper wire, although it is stated that where it has been used the speaking through appears particularly good, which may possibly be due to the particular balance which exists in the aluminium wire between the resistance, inductance, and capacity, aluminium having somewhat less self-induction and more capacity than a copper wire of the same resistance. Aluminium is particularly well suited for 'bus-bar construction owing to the great saving in weight and the lower cost, but care should be taken when using aluminium for such purposes to provide for expansion and contraction. Aluminium also is very widely used for low-voltage direct-current feeders

Digitized by Google

for railway work. The 53 per cent. reduction in weight as compared with copper requiring smaller poles, and the increased radiating surface of the aluminium feeder, allows a greater overload to be carried by it than with copper. The most prominent use of aluminium electrically is for overhead high-voltage transmission circuits. When first introduced considerable trouble was experienced with breakage resulting from flaws in the material and from crystallisation due to the wire swaying in the wind, but wires are now supplied stranded instead of solid, even down to small sizes, and the original trouble of breaking has disappeared. The writer of the paper had communicated with many users of aluminium wire so as to get their expression of its position as an overhead conductor as compared with copper, and his replies illustrate the following points: That the wire now furnished from the manufacturers is entirely reliable. The wire is not easily affected by ordinary atmospheric conditions, but where the air is badly contaminated with chemical fumes it is best to protect the wire with a weather-proof insulation, but in the case of a damp atmosphere near the seacoast the metal will protect itself by a thin improvised coat of oxide. Aluminium wire gathers much less salt than copper. It costs less to erect aluminium wire on account of its weight, but being softer it must be more gently handled than copper. The fundamental consideration which enters into the use of aluminium for overhead line work is that of wind pressure, and especially so in modern long span suspensions. The author has made experiments on a 950ft. span with supports 45ft. high. The highest actual wind velocity he had so far come across was 34 miles per hour.

A good many papers were read dealing with the single-phase motor for railway work, as there seems to be a strong influence at work in the States proclaiming the virtues of this type of machine, which a few years ago nobody had a good word for. A very interesting paper was read giving a description of Mr. Arnold's method of utilising single-phase synchronous motors for railway work in connection with air-compressor engines and air-storage tanks. It is, of course, well understood that if the difficulty of getting the synchronous single-phase motor up to speed, and also of overcoming the difficulty of obtaining a suitable starting torque, could be overcome, that this type of motor has many advantages due to its satisfactory operation on high-voltage lines, and also the simplicity of the generating and transmitting apparatus required with same. Mr. Arnold proposes to get over these difficulties and has made same extensive and interesting experiments on the matter, although his system is still only partially developed, but it certainly involves some novel and interesting features. For instance, the motor is constructed so that both the armature and field-magnet system, or, as he calls them, the rotor and stator, can both revolve—that is to say, the stator may be held stationary and the rotor revolve, or, *vice versâ*, the motor held stationary and the stator revolve. The rotor is geared to the axle of the car by means of a crank pin secured to a pinion, which also drives a compressor cylinder, while the stator is free to revolve round the rotor, and drives, by means of a crank pin, a second compressor cylinder. Both cylinders are piped to air reservoirs located under the car, or one cylinder may be used as a compressor and the other cylinder as an engine driven by compressed air from the former. When this car is standing in a station, the rotor, being rigidly geared to the car axle, is stationary, while the stator runs with full synchronous speed, and is thus transferring full energy through the crank to the compressor cylinder, while energy is being stored in the form of compressed air in the air reservoir. To stop the car, it is possible to increase the pressure behind the compressor piston attached to the rotor to such an extent that it overcomes the effort of the rotor to revolve, thus tending to cause the stator to revolve, while at the same time it holds the car at rest without the use of wheel brakes. To start the car by means of the controller which operates valves, the air cushions behind the piston of the rotor cylinder is removed. The air which is being compressed by the stator cylinder, supplemented by the storage air from the tanks, is now allowed to act on the back of the rotor piston; the rotor then begins to revolve, and as it accelerates the stator slows down by exactly the same amount that the rotor has increased its speed. As the rotor and car speed increase, the controller is gradually moved so that the inlet valves of the rotor cylinder give a small percentage of cut-off until the car speed corresponds to the full synchronous speed of the motor, at which time the stator comes to rest. To bring the car to rest, instead of applying mechanical brakes to the wheels in the ordinary manner, thereby dissipating the entire stored energy of the car in the form of heat, the energy is saved in the form of compressed air to assist in starting the car by setting the controller in such a position that the rotor cylinder compresses air and delivers it into the storage tanks. Any desired rate of retardation can be secured by throttling the delivery passages from the rotor cylinder. The inventor admits that the machine in its present form is somewhat complicated for commercial application, but by the development of suitable rotating air machinery the system is capable of great simplification, as by this means the large number of reciprocating parts with their complicated valves, etc., would disappear.

RESIGNATION OF THE WOOLWICH ELECTRICAL ENGINEER.

Mr. John B. Mitchell, electrical engineer for the borough of Woolwich, has sent in his resignation (under protest) of the appointment which he holds under the Council, and the same has been accepted by the General Purposes Committee, and was to come before the Council last night. Mr. Mitchell was appointed electrical engineer by the late Plumstead Vestry, and was transferred to the new authority when Woolwich was made a municipal borough. The present intention of the committee is to throw open the appointment to competition, and advertise for candidates. The salary at present attaching to the appointment of electrical engineer is £500, but it is more than likely that in order to get a "superior man" another £50 will be offered.

We have not had time to investigate this matter, but just as we are going to press our attention has been drawn to a leader in the *Kentish Independent*, entitled "Very Shabby," which deals with the subject as follows:

"Government by party—whether in political or municipal matters—is responsible for many shady transactions, but not often, in this locality at least, for anything so shabby as the treatment which has been meted out by the Labour Party to Mr. Mitchell, the electrical engineer to the borough of Woolwich, whose resignation, under protest, we report elsewhere. It is, of course, within the rights of any municipal authority to dismiss, or call for the resignation of, any of its officers, should the necessity, from any cause whatsoever, arise; but it should be done in the proper constitutional way. But what has happened in Mr. Mitchell's case is this. A note was dispatched by the town clerk, upon the instructions of the mayor, to Mr. Mitchell, asking him to meet the mayor, together with Councillors Grinling and Sheppard, in the mayor's parlour, on Sept. 8. Mr. Mitchell kept the appointment, when the mayor informed him that they had asked him to meet them to discuss the situation of the electricity department generally. His Worship went on to say that it might be thought by some people that he and his party were too impatient, but they themselves had come to the conclusion that they had been very patient, in fact, too patient, with regard to the working of the electricity department. At this juncture, we understand, the electrical engineer put the very pertinent question as to on what authority they called upon him to discuss at such a meeting any matter concerning the electrical undertaking. Matters had gone thus far when Councillor Grinling intervened by saying that the interview was but a friendly one, and that they had been requested by the Labour Party to ascertain if matters could not be remedied. This brought the reply from Mr. Mitchell that he had no desire to discuss matters with this unofficial deputation, and, further, he was under the impression that the electricity undertaking should be run on proper commercial lines, and for the good of the community as a whole, and not to suit any particular party, whatever they might call themselves. This, we think, was in the circumstances a very proper answer, though possibly it might not have been a politic one. This unpleasant interview, we are told, was brought to a close by a pretty plain intimation to Mr. Mitchell that he had better resign.

"We feel bound to ask, in the interests of the ratepaying public, what right had these gentlemen to arrange a private meeting without any mandate whatever from the Borough Council, and quite unbeknown to them—in order to force a resignation from a public officer. We do not doubt that in what they did they acted with the best intentions—from their point of view—but they made a great mistake. The proper course of action was to bring any complaint before the Electricity Committee, and through them before the Council. The fact is, as we have pointed out in these columns over and over again, the electrical undertakings of the borough are becoming a gigantic success, and more is expected of the electrical engineer than any one man can do, and the pace of expenditure has become much too fast with the information and time available for the preparation of engineering and other details. Besides this, the Electricity Committee is composed for the most part of men who know as much about electricity as Cæsar did of the telephone—absolutely nothing. And such a combination, instead of helping an official, only hinders him and renders him dissatisfied and desperate.

"We are sure the public will sympathise with Mr. Mitchell in the manifestly unfair treatment he has received at the hands of the party who dominate the Woolwich Borough Council in being made a convenient scapegoat. It is only another instance of the unsatisfactory results of the introduction of party politics into local government."

TRADE NOTICES AND NOVELTIES.

New Accessories.

The accompanying illustrations (Figs. 1 and 2) show two useful tumbler switches, being new adaptations of Mr. A. P.

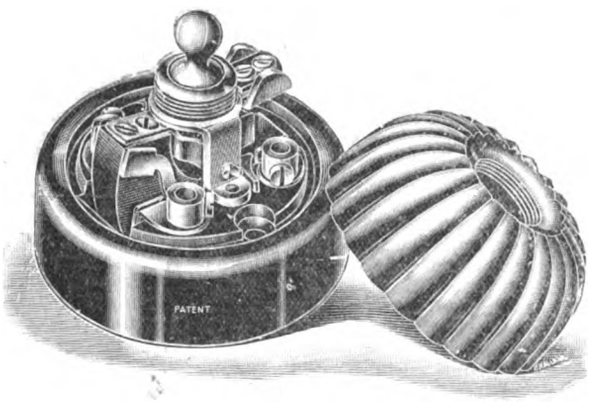

FIG. 1.

Lundberg's patent "Duplex" switch movement which was recently described in our columns. Referring to Fig. 1, the requirements met by this switch are as follows—viz., series-parallel with "off" position, whole or part circuit with "off" position, and reversing with "off" position. When one of the

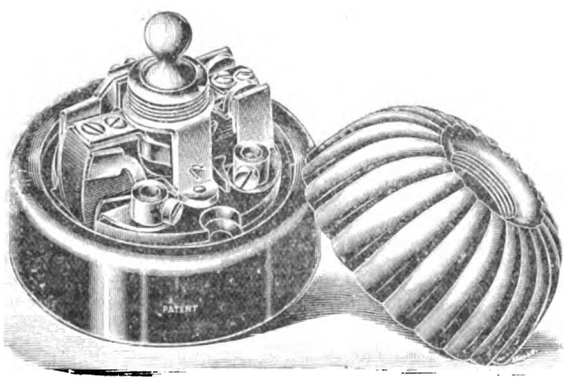

FIG. 2.

contact arms is in its "on" position it is locked there, the contact arm which is in its "off" is also locked, the same locking action taking place when the contact arms are in their opposite positions. The single spiral spring used allows equal tension on both contact arms, and produces no jar to the fingers of the operator. Moreover, the "off" position is very definite. Covers are made in a variety of patterns for this switch, which can also be supplied in flush and suspension types. The three-way switch (Fig. 2) with "Duplex" movement, is as distinctly noteworthy. It is, however, unnecessary to enumerate here the many novel applications and economies which can be effected through the use of these special tumbler switches. Suffice it to say they mark a great advance on the clumsy and expensive methods of adapting turn-type switches which have hitherto been employed to meet the same requirements. Fig. 3 illustrates the "Presto" tumbler switch. This is Mr. Lundberg's latest pattern of "Pivot"

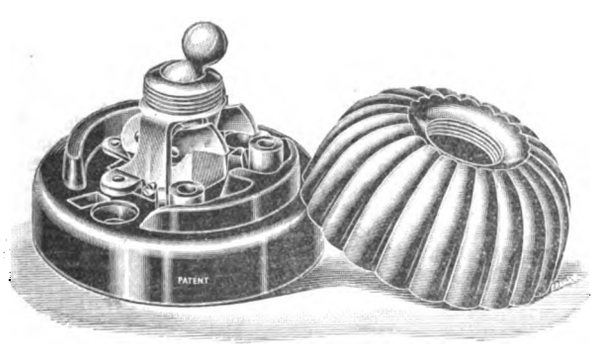

FIG. 3.

switch movement. Ebonite for insulation in the rocking bar is dispensed with; it is now made of metal and porcelain only. The application of the mousetrap type of spring to produce the "variable leverage" action and locked "on" position which are the features of the "Pivot" movement, is quite novel. This switch has all the advantages of the standard "Pivot" switch, but, so far, is made only in the single-way type. Our next illustration (Fig. 4) represents a two-way switch of the suspended pear "see-saw" type. This switch is of effective construction on a porcelain base, easily removable from the containing case to facilitate wiring up. It is provided with a division between the terminals and an insulated sliding bar. The "M. I. P." ceiling rose (Fig. 5) is another novelty. It can be adapted in at least 17 different

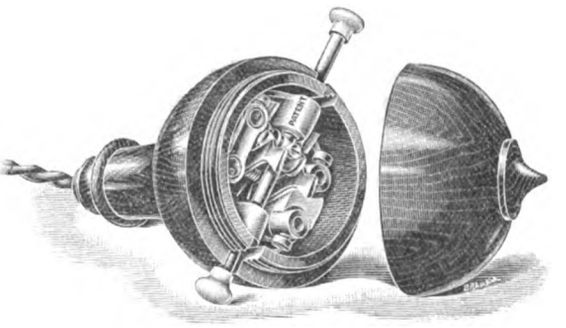

FIG. 4.

ways. The arrangement of the detachable plug and terminals allows of this versatility, whereas an ordinary ceiling rose has but a limited application. The thought may occur to the reader that Mr. Lundberg is certainly not less versatile as an inventor. He is always presenting some fresh novelty or economising device, and as his electrical accessories are invariably of substantial design and thoroughly well made, we never have the slightest hesitation in recommending them.

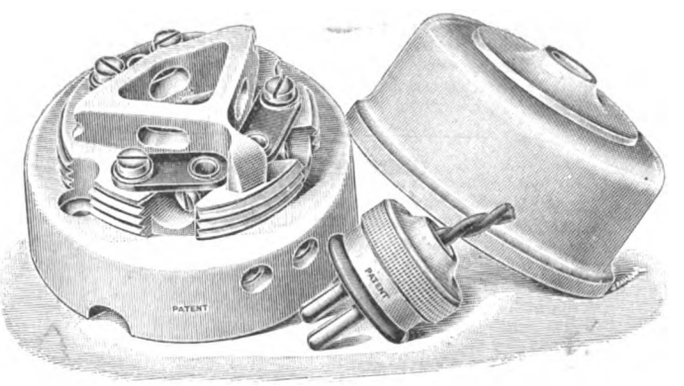

FIG. 5.

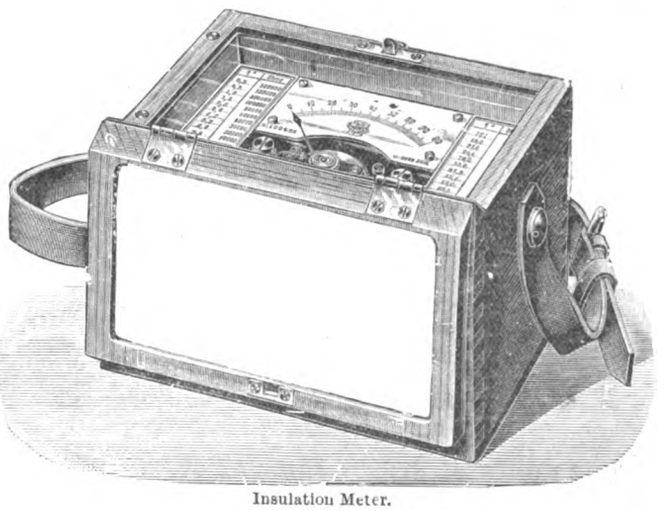
Insulation Meters.

Our illustration herewith shows one of several useful types of insulation meters, for installation work, supplied by the Union Electric Company, Limited, 151, Queen Victoria-street, E.C. This instrument comprises a permanent-magnet moving-coil galvanometer, series resistance, and dry cell battery enclosed in a portable case. It can be used in any position and is unaffected by external magnetic fields, means being also provided to enable it to be used for testing purposes at the supply pressure.



Insulation Meter.

Simplicity of operation and great accuracy are claimed as its leading features. Further particulars will be found in a list dealing with detectors, ohmmeters, and magneto-generators recently issued by the above firm.

Cheaper "Osmi" Lamps.

It will be seen on referring to our advertisement columns, that the General Electric Co. are making a reduction in the prices for their "Osmi" lamps. The high efficiency of these lamps is well known, but hitherto the high prices charged for them have retarded their popularity. We are, therefore, pleased to note the reduction in question.

LEGAL INTELLIGENCE.

LAMBETH ELECTRIC LIGHT UNDERTAKING.

Metropolitan Borough Council of Lambeth v. the South London Electric Supply Corporation.

An action was decided in the King's Bench Division yesterday before Mr. Justice Bigham, in which the Borough of Lambeth Corporation sought for penalties for breach of agreement against the South London Electric Supply Corporation. Under this agreement the latter undertook to destroy in a refuse destructor in connection with the electric light station all the dust-bin refuse of the borough. This was one of the terms under which the Lambeth electric lighting order was originally transferred to the company. After the destructor had been at work for some time, it was closed down as a nuisance on the application of the plaintiffs. It was part of the original agreement that the destructor should be of such a design as was approved by the Vestry, and the company got this approval before constructing the same. They accordingly counterclaimed for the value of the destructor, which was rendered useless to them by the action of the plaintiffs. The case was fought out on a point of law, which turned on the fact that in advertising the transfer of the order, the Lambeth Vestry (now merged in the Corporation) had not disclosed the full details of their agreement. Without hearing technical evidence, his Lordship gave judgment for the defendant company on the claim. He also gave judgment in favour of the South London Electric Supply Corporation on the counterclaim, after the Corporation had agreed to forego damages. They, therefore, get their costs under both actions.

UNDERGROUND MAINS.

Mr. Justice Warrington, sitting in the Chancery Division on Friday last, disposed of the case of the Ingleton Electric Lighting and Power Co. *v.* the Ingleton Gas Co., in which the plaintiffs sought damages from the defendants for injury alleged to have been done to a cable by the defendants' workmen whilst engaged in relaying a gas-pipe. For the plaintiffs it had been stated that they were authorised by provisional order to supply electric light and power to the district of Ingleton, and they had statutory powers to put down mains and cables, subject to the authority of the Board of Trade, and this they had done. The defendants, it was said, had no statutory powers at all to open streets and lay mains, but they did so, and in the course of some of these works they so injured one of the cables belonging to the plaintiff company that the village of Ingleton was thrown into darkness one night, the supply of electric power very seriously incommoded for some time, and the actual fault was only found after some difficulty and at great expense. This was caused, it was contended, by the negligence of the defendants' servants.

After hearing evidence on both sides, his LORDSHIP, in giving judgment, said that as to the actual facts he preferred the evidence of the defendants' witnesses to that of the plaintiffs'. The former were the people who had done the work, and in his opinion they were more to be trusted. If the gas-pipe had been in the middle of the trench dug by the defendants, the edge of the trench would have been 14in. from the feeding cable which was injured. It came out in the evidence, however, that the pipe was not in the middle, and the edge of the trench was further still from the cable. The plaintiffs' theory was consistent with the injury having been caused during the opening of the trench in January, but they had not, in his opinion, discharged the onus which was on them of establishing that the injury was occasioned by the defendants' workmen, and he thought if he was to accept the description of what was done by the defendants he must come to the conclusion that the injury was not done by them. His Lordship did not think it was consistent with the facts that the injuries should have been occasioned by a pick used by their workmen. The strength of the plaintiffs' case was this: there was a hole admittedly occasioned by external agency, and by a blow of such an instrument as a pick. No explanation was offered as to how the injury could have been occasioned. The answer was that the plaintiffs had to satisfy the Court that the injury was done by the defendants, and it was not for the defendants to find the explanation of how the injury was done. Believing the evidence of the defendants, he had to come to the conclusion that the facts they proved were inconsistent with the idea that the injury was done by them. The plaintiffs, to his mind, had not established their case, and there would be judgment for the defendants, with costs.

THE MONTREAL STREET RAILWAY CO. v. THE CITY OF MONTREAL.

This was an appeal before the Judicial Committee of the Privy Council from a judgment of the Supreme Court of Canada of March 25, 1904, reversing a decision of the Court of King's Bench for Quebec and a judgment of Mr. Justice Davidson's.

The arguments were heard in July before a Board composed of Lord Davey, Lord James of Hereford, Lord Robertson, and Sir Andrew Scoble, when judgment was reserved.

Sir ANDREW SCOBLE, in now delivering their lordships' judgment, said the main question in the appeal was whether the city of Montreal was entitled, under its contract with the Montreal Street Railway Co., to claim percentages upon the gross earnings arising from the whole operation of its railway—whether within or without the limits of the city of Montreal—or whether such percentages were payable only in respect of such earnings as arose from the operation of its railway within the limits of the city. The contract was authorised by the city authorities by "By-law No. 210, concerning the establishment and operation of an electric passenger railway in the city of Montreal by the Montreal Street Railway Co.," which was accepted by the company on Dec. 28, 1892. The contract itself was executed by the parties on March 8, 1893. At the time of its execution the company had in operation a railway worked by horse traction situate in the city with short extensions into some of the adjacent municipalities. The article of the contract relating to the payment of percentages was Article 36, and was in these terms: "The company shall pay to the city annually, from Sept. 1, 1892, upon the total amount of its gross earnings arising from the whole operation of its said railway, either with cars propelled by electricity or with cars drawn by horses," certain specified percentages. The reason for including both methods of traction or propulsion by horses or by electricity, was stated to be that the change from horse power to electric power was necessarily to be gradual, and might, under Article 15 of the contract, possibly not be completed until Sept. 1, 1895. The law applicable to the construction of this contract was thus expressed in Article 1,018 of the Civil Code of Lower Canada: "All the clauses of a contract are interpreted the one by the other, giving to each the meaning derived from the entire Act." Regarded in that light, the contract was for the establishment and operation of an electric passenger railway in the city of Montreal. Article 1 provided that "the Montreal Street Railway Co. shall establish and operate, subject to the conditions hereinafter mentioned, lines of railway for the conveyance of passengers in the city by means of cars propelled by electricity in the streets hereinafter mentioned and in all other streets which may hereafter be determined by the Council of the city of Montreal." Article 12 provided that "the *tracé* of routes in the different streets of the city, as well as the establishment and transfer connections, shall be made and shall remain under the control of the City Council. Until further orders the cars shall run in the streets mentioned in the schedule of routes herein below indicated." That schedule was given in Article 46, and enumerated 19 routes, all of which were in the city, and many of which purported to run "from the eastern city limits" to "the western limits of the city of Montreal." As regarded the privileges conferred on the company with regard to the use of electric power in the streets, the right to open the streets, and so forth, the city could only deal with the streets within its jurisdiction, nor had it power to regulate times and fares beyond its own limits. Every outside municipality into whose area the company might desire to extend its operations had independent powers in those respects, and with them the company had to make separate arrangements. Indeed, the only reference in the contract to areas outside the limits of the city was contained in Article 44, which provided that "in the case of annexation by the city of any of the outside municipalities the company shall be obliged within three months after being ordered by the Council to extend their system through that new annexed portion of territory not already provided with electric cars, and to furnish a similar service as is furnished to the city." No such annexation, their lordships were informed, had taken place, but the insertion of that provision was a clear indication that the city considered that the territories of outside municipalities were not included in the scope of the contract. Looking at the contract as a whole, it appeared to their lordships that the lines of railway contemplated by it were, as defined in Article 1, "lines of railway for the conveyance of passengers in the city," and that the expressions "the said railway," "the said railway tracks," and "its said railway," wherever they occurred in the contract, must be taken to refer to the lines within the limits of the city. The percentages, therefore, claimable by the city were only upon the gross earnings arising from the whole operation of the lines within those limits. Some of the earnings of the company arose from traffic which began and ended within the limits of the city, but another, and possibly a greater, part was derived from traffic which originated in the city and terminated in the suburbs or originated in the suburbs and terminated in the city. For all traffic attributable to the operation of the railway in the city, wherever it originated or terminated, the company was accountable. The accounts of the whole earnings had, therefore, to be submitted and checked in order that the proper percentage payable to the city might be ascertained and verified. A second question discussed in the local courts was as to the method on which the accounts between the city and the company had been adjusted. From the nature of the case it was impossible to separate the earnings inside from those out the city with anything approaching mathematical accuracy, and accordingly the judge of first instance, by an order of Nov. 19, 1898, very properly referred it to two experts, one of whom was the treasurer of the city of Montreal, and the other the comptroller of the Canadian Pacific Railway Co., to examine into the method of calculation to be adopted in order to secure a just apportionment. Those gentlemen reported that "after considering divers other methods by which such apportionment might be arrived at," they were of opinion "that the system now pursued by the Montreal Street Railway Co. is the most practical one and in its operation just, but that if any change were to be made it would be to increase the earnings per car mile in favour of the outside districts." The learned judge adopted their report, and it was confirmed by the judgment of the majority of the Court of King's Bench. Their lordships saw no reason to dissent from that conclusion. They would humbly advise his Majesty that the appeal ought to be allowed and the judgment of the

Digitized by Google

Supreme Court reversed, with costs, and that of the Court of King's Bench confirmed. The respondents must pay the costs of the appeal.

SOUTH LANCASHIRE ELECTRIC TRACTION CO.

In the Lancashire Chancery Court at Liverpool on Monday last the case of Krauss *v.* the South Lancashire Electric Traction and Power Co., which was a debenture holder's action, came on for further consideration before Vice-Chancellor Leigh Clare.

Mr. PRESTON, who represented the plaintiff, said the property subject to the debenture stock comprised the whole of the shares of the South Lancashire Tramways Co. and the South Lancashire Light Railway Co., a generating station for the supply of electricity, and certain small items. Mr. Arthur Stanley, M.P., purchased the property for £150,000, but out of this two prior encumbrances had to be provided for. The first was a charge in favour of Parr's Bank, in respect of which there was £37,500 now due, money borrowed in order to complete a portion of the tramways company system, and the second encumbrance was a claim by the Electric Conversion Syndicate, who had brought an action against the Company. If the action of that syndicate succeeded, it was possible there would be a claim taking priority to the debenture stock. The purchaser being a debenture holder of the company, it had been arranged that he should set off as part of the purchase money what would become due to him as dividend on his debentures, and provision was made for the judgment on costs and the remuneration of trustees.

The Vice-Chancellor made an order.

TRAMWAY EXTENSIONS.

In the Sheriff's Court on Friday last, Mr. Under-Sheriff Burchell had before him the case of Crutcher *v.* London County Council, in which Mr. George Crutcher, of Queen's-road, Peckham, S.E., claimed compensation in respect of three-quarters of the forecourt of his premises appropriated by the Council for tramway purposes.

Mr. Boydell Houghton announced that by consent of the two parties the jury had agreed upon a verdict of £300.

TRAMWAY COLLISION.

In Hamilton Sheriff Court on Tuesday, Sheriff Thomson closed the record and fixed proof in three actions against the Lanarkshire Tramway Co., at the instance of James Marshall, farmer, Airbles; Robert Hamilton, farmer, North Motherwell; and Ebenezer Inglis, gamekeeper, Logans, for damages arising out of a collision in the Motherwell-road on the evening of March 25 last. The amounts sued for are respectively, £5,000, £2,000, and £1,500. The defence is that parties were themselves liable for the accident by not keeping a proper lookout and crossing in front of a running tramway car. The cases, it was stated, are to be sent to the Court of Session for trial by jury.

COMPANIES' MEETINGS AND REPORTS

AMAZON TELEGRAPH.

The ordinary general meeting of this Company was held on Tuesday last.

Mr. GEORGE KEITH, who presided, said the past year had been a very successful one for the Company. The price of rubber had been abnormally high and commercial activity had increased. During the year their cables had worked well, and had carried more traffic, though they still suffered somewhat from landslips on the banks of the river. They were, however, gradually moving the cables into positions which would render them less liable to damage from this cause. The traffic receipts for the year amounted to £67,253, and, compared with those of the previous year, showed an increase of £26,702. This was partly due to an increased volume of business, and to increased rates. The total working expenses were £52,883, and showed an increase of £8,840; station expenses were £949 more, chiefly on account of the higher value of the currency; ship expenses were £1,082 less, owing to fewer repairs being required during the year. The cost of cable had been a very heavy item, owing to the large amount of restoration work carried out on the three remaining branches of the section. The Alemquer section was relaid in January last, at about a cost of 34 miles of cable, and about 100 miles were expended in restoring the two Macapa Chaves sections, the work of restoring these two cables being completed in July last. After meeting expenditure and providing for all charges, there remained a credit balance of £9,836, as compared with a deficit of £7,130 for the previous year. The directors had been able to readjust the finances of the Company and put them on a more permanent basis. Temporary loans were paid off by the issue of £100,000 of 6 per cent. debentures. Altogether, the position of the Company had greatly improved.

The report was adopted.

LANCASTER AND DISTRICT TRAMWAYS.

The report of this Company for the year ended Sept. 30 last, to be submitted at the meeting on the 18th inst., states that receipts from all sources show a decrease of £576. The result of the year's working is a profit of £662, and, after paying interest on loans, amounting to £642, there is a balance of £20 remaining to be carried forward. The number of miles run has been 84,856 as compared with 92,600, and the number of passengers carried 422,615, as compared with 450,803 last year, showing a decrease of 7,744 miles and 28,188 passengers. The receipts per mile have been 14·94d. as compared with 14·59d., and expenditure 13·15d., as compared with 12·94d. last year. Cost of provender and bedding per horse per week has been 8s. 10d. as compared with 8s. 7½d. last year.

WEST INDIA AND PANAMA TELEGRAPH.

The report for the half-year ended June 30 states that the amount to credit of revenue is £32,773, against £34 581 for the corresponding half-year of 1904. The expenses have been £23 230, against £23.437, leaving a balance of £9,543, to which is added £1,756 interest on investments and £494 brought forward, making a total of £11,793. It is proposed to pay 6s. per share on account of arrears of dividends to June 30, 1905, on the first preference shares, absorbing £10,368, leaving £1,423 to carry forward. This will leave the following dividends in arrear: on the first preference shares, £3,456; on the second preference shares, £14,007. The directors report that the British Guiana subsidy of £4,500 per annum, voted for 10 years from Jan. 1, 1892, in consideration of the Company's laying a new cable between that colony and Trinidad, and continued at that rate up to March 31 last, has from that date been reduced to £3,000 per annum.

WESTMINSTER ELECTRIC SUPPLY.

An extraordinary general meeting of the Westminster Electric Supply Corporation was held on Wednesday at the offices, Eccleston-place, S.W., when the resolution increasing the capital of the Company from £800,000 to £2,000,000, by the creation of 240,000 shares of £5 each, was unanimously confirmed.

ALLGEMEINE ELEKTRIZITAETS-GESELLSCHAFT (BERLIN).

In their annual report the directors of this Company announce a dividend of 10 per cent., as against 9 per cent. 12 months ago. A meeting will be held on Dec. 11 to sanction an increase in the capital of the Company from 86 to 100 million marks. The net profits for the past year have amounted to 10,354,000 marks, as against 8,566,000 marks in 1903-4.

APPOINTMENTS VACANT.

Switchboard Attendant, Southend Town Council electricity works. Salary, £1. 1s. per week.

Assistant Lecturer and Demonstrator in Electrical Engineering, Leeds University. Salary, £175 a year.

Laboratory and Workshop Assistant, Battersea Polytechnic, S.W. Commencing salary, 20s. a week. See advertisement in last issue.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office.

Wireman for electric light and power plant. Applications to Box 29, *Electrical Engineer* Office.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sell's Advertising Offices, London, E.C.

Junior Assistant Wages, 30s. per week. Applications to Engineer, Electricity Works, Canterbury, by Nov. 18. See advertisement in last issue.

Representatives for an electrical contracting firm. Applications to Box G 33, *Electrical Engineer* Office.

Junior Charge Engineer. Salary, 30s. per week, rising to 35s. Applications to the Borough Electrical Engineer, 335, High-street, Cheltenham. See advertisement in last issue.

Mechanical Draughtsman, Birmingham University. Salary, £250 per annum. Applications to the Secretary before Nov. 27. Full particulars in advertisement columns.

Switchboard Attendant. Wages, 25s. per week. Applications to Box B P 5, *Electrical Engineer* Office. See advertisement.

Improver. Wages, 10s. per week. Applications to Box 702, *Electrical Engineer* Office. See advertisement.

NEW COMPANIES REGISTERED.

Canadian Industrial Co, Limited.—Capital, £50,000. Object: to use water power for producing electricity, and for other purposes, to construct, equip, operate, and maintain electric, cable, or other tramways and telegraph or telephone systems, etc. Registered office: 58, Lombard-street, E.C.

British Buffalo Marine Motor Co., Limited.—Capital, £5,000. Object: to adopt an agreement with W. A. Cloud and H. J. Nichols, and to carry on the business of engineers and repairers of motors, parts, and accessories.

British Hosiery and Electrolytic Bleaching Co., Limited.—Capital, £60,000. Object: to acquire certain patents relating to the Vogelsang electrical bleaching process, now belonging to the Foreign Electrical Bleaching Patents, Limited, etc. Registered office: 6, Eastcheap, E.C.

Peru Copper Syndicate, Limited.—Capital, £5,050. Object: to acquire any copper or other mines and mining rights.

Digitized by Google

Rubber Producers' Syndicate, Limited.—Capital, £7,000. Object: to carry on the business of planters and producers of and dealers in indiarubber, guttaperchs, balata, and other gums.

Jones and Leslie, Limited.—Capital, £2,000. Object: to acquire and carry on the business of electrical engineers carried on at 25 31 Eyre-street-hill, Hatton-garden, E.C., by T. L. Jones, as Jones and Leslie.

Cumberland Power Syndicate, Limited.—Capital, £5,000. Object: to adopt an agreement with J. Sturgeon, B. H. Thwaite, A. R. Chorley, and J. Paterson, and to carry on in Cumberland and elsewhere the business of an electric power and power gas supply company, etc. Registered office: 4, South-parade, Leeds.

Wemyss and District Tramways Co., Limited.—Capital, £55,000. Object: to acquire the rights under the Wemyss Tramways Order Confirmation Act, 1905, for the construction and working of electric tramways in the parishes of Kirkcaldy and Dysart, Wemyss, and Scoonie, and within the burghs of Buckhaven, Methil, Innerleven, and Leven, Fifeshire. Registered office: Royal Bank-buildings, High-street, Leven.

Bowers and Hargrave, Limited.—Capital, £1,500. Object: to carry on the business of dealers in incandescent, electric, and other fittings, etc.

Egyptian Contracts Co, Limited.—Capital, £10,000. Object: to acquire and work rights, concessions, and contracts in Egypt and the Soudan. Registered office: 62, London-wall, E.C.

Liens Registered.

Northampton Electric Light and Power Co, Limited.—Lien registered Nov. 6 for £300 4 per cent. debentures, part of a series not to exceed two-thirds of the subscribed and paid up capital. Amount previously issued, £33 200. No trustees. Charged on the undertaking, property, and uncalled capital.

Northallerton Electric Light and Power Co., Limited.—Lien registered Nov. 4 for £1 000 5 per cent. debenture, part of £5,000. Amount previously issued, £3,740. No trustees. Charged on all the property, present and future, including the uncalled capital.

Electrolytic Alkali Co, Limited (Middlewich).—Lien registered Oct. 31 for £200 4½ per cent. debentures, part of £50,000. Amount previously issued, £20 650. Charged on the undertaking and all the property for the time being, including the uncalled capital.

North Wales Power and Traction Co, Limited.—A charge dated Oct. 16, 1905, to secure £30,000 has been registered. Property charged—the company's undertaking and property, present and future, including uncalled capital, subject to £150,000 debenture stock. Holders—W. W. Pilkington and J. Beecham, both of St. Helens; J. Tomkinson, M.P., Willington Hall, Tarporley, Cheshire; D. McKechnie, Hillside, Cowley Hill, St. Helens; and E. Wagg, Southsea House, Threadneedle-street, E.C.

Scottish House-to-House Electricity Co, Limited.—A charge for £500, dated Oct. 24, 1905 (supplemental to a charge of March 31, 1904), has been registered. Holders—County of London Electric Supply Co., Moorgate-court, E.C. Property charged—the company's undertaking and property, present and future.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Cardiff.—The Asylums Committee require tenders for generating plant. Tenders by Nov. 27.

Torquay.—The Town Council invite tenders for generators, booster, traction battery, and switchboard. Tenders by Nov. 20. See advertisement in last issue.

London, W.—Messrs. Grice and Co., Addison Wharf, Warwick-road, Kensington, require a 10-ton electric derrick crane with 60ft. to 70 t. jib, continuous current.

Bermondsey.—Tenders for new plant, estimated to cost £5,390, will shortly be advertised for. An estimate is being prepared for condensing plant, for which tenders will be invited.

Ebbw Vale.—The Urban District Council invite tenders for free wiring and supply of incandescent lamps. Tenders by 12 noon on Nov. 25. Full particulars in advertisement columns.

Rawtenstall.—The Corporation invite tenders for the electric light wiring and fittings of the new free library. Tenders to Messrs. Lacey, Sillar, and Leigh, 78 King-street, Manchester, by Nov 20.

Omnibus Lighting.—A London motor omnibus company is open to receive proposals for the lighting of its vehicles by acetylene or electricity. Apply to Box 306, Willing's, 125, Strand, W.C.

Beckenham.—The Urban District Council invite tenders for two 250 kw direct-current railway generators, direct coupled to two high-speed, vertical enclosed type engines. Tenders by noon on Nov. 23.

Sao Luiz.—The Municipality require tenders for electric lighting of the town. Tenders by Dec. 15. Particulars may be obtained from the Municipal Secretary of Sao Luiz in the State of Maranhao, Brazil.

Harrogate.—The Directors of the Frederick Hotels Co. invite specification and tenders for laying down electrical plant at the Hotel Majestic, Harrogate. Further particulars on application to the Secretary, 8, Bloomsbury-square, London, W.C.

Aston Manor (near Birmingham).—The Public Works Committee invite tenders for the maintenance of a portion of their tramway system for 12 months from Jan. 1 1906. Tenders to the Chairman of the Public Works Committee, Council House, Aston Manor, by noon on Nov. 24.

Whitchurch (near Cardiff).—The Asylums Committee of the Corporation invite tenders for the following plant, to be delivered and erected at the asylum: (Section 1) battery of accumulators, with booster; (2) engines and generators; (3) switchboard. Tenders to Mr. J. L. Wheatley, Town Hall, Cardiff, by Nov. 27.

Bray (Ireland).—The Urban District Council invite tenders for the supply and delivery of 220 yards $^{7}/_{16}$ concentric paper-insulated and lead-covered cable for a working pressure of 200 volts, and 10 10-ampere alternating-current induction voltmeters, 100 volts, 60 periods. Tenders to Mr. P. MacDonnel, clerk, by 10 a.m. on Nov. 21

Christiania.—The Norwegian Telegraph Department are calling for tenders for the supply of 3,000 kg. of bronze wire. Tenders from British firms should be lodged *by their agents* in Christiania by midday on Dec. 1. The conditions of tender can be seen by agents on application to the telegraph authorities at Christiania, Bergen, Stavanger, and Arendal. Apart from the usual Customs duties, a preference of from 10 to 15 per cent. is given to Norwegian manufacturers.

Spain.—The *Gaceta de Madrid* of Oct. 10 contains details of a concession for the construction of an electric tramway as an extension to that of the east of Madrid. Tenders must be sent in by Dec. 13 to the Director of Public Works, Madrid, in whose office particulars may be seen. A deposit of 1,899·95 pesetas, or about £60, is required to qualify any tender. Local representation is necessary. The same journal of Oct. 12 contains a notice of a concession granted to the Sociedad Los Tranvias de Zaragoza for the construction of an electric motor tramway in that city. The *Gacetas* may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

RESULTS OF TENDERS.

Hereford.—The tender of Callender's Cable and Construction Co. for bitumen cables for Widemarsh-street auxiliary feeders, at £48. 1s. 8d., has been accepted.

Colchester.—The Town Council have accepted the tender of Mumford and Co., at £78, for a vertical Weir-pattern steam pump capable of delivering 3,500 gallons an hour, and the tender of Stanford and Co., at £37. 5s., for supply and erection of a steel water-tank, 12ft. by 3ft. by 3ft., and framework.

Erith.—The Urban District Council at their last meeting accepted tenders as under: Electric Construction Co., motors; C. Booth and Co., Liverpool, at £86. 10s., for the supply of hydraulic pit bogie, car-body lifting appliances, and one pair of traversing jacks. The British Westinghouse Co. are to supply some additional spare parts for the cars at an extra cost of approximately £50.

North-Eastern Railway.—The company have placed a contract with the British Thomson-Houston Co., of Rugby, the contractors for the electrification of the Tyneside branches, for 285 5-ampere direct-current and 600 7½-ampere alternating current lamps of a patent design. Note.—Each of the 5 ampere lamps, which will operate on circuits of 110 volts, are to burn no fewer than 150 hours, whilst the 7½-ampere alternating-current lamps are to burn 80 hours before any recarboning will be necessary.

Purifiers.—The Paterson Engineering Co., Amberley House, Norfolk-street, W.C., report recent orders, including a Paterson condensation water purifier of 70,000lb. hourly capacity, for the Cleveland and Durham County Electric Power Co. (through Willans and Robinson); also water softeners and heaters, etc., for Great Western Railway electric power station, Park Royal (through Aiton and Co.), the borough of Southwark electricity works, and (through J. G. White and Co.) for Buenos Ayres and Monte Video. They also report orders in hand for purifiers for power plants at the Cape Copper Co.'s works, South Wales; Poplar union workhouse; Felix Hotel, Felixstowe; Hollingworth and Co., Turkey Mill, Maidstone, etc.

Worcester.—The City Council have accepted the following tenders for coal for the electricity stations at Powick and Hylton-road: South Wales, etc., Coal Co., best large Welsh smokeless steam coal, 18s. 6d. per ton; through-and-through Welsh coal as now supplied, 15s 9d; best Welsh washed steam nuts, 16s. 3d; best large Staffordshire coal, 12s. 6d.; best Staffordshire nuts, 11s.; best washed Staffordshire nuts or beans, 9s. 3d.; best steam coal from the Cannock Chase or North Warwickshire district, 12s. 6d.; best bright slack, 7s. 6d.; Dynevor through-and-through coal, 15s. 6d.; ditto, Nantyglo-Merthyr, 15s. 3d. For Tybridge-street: Underwood and Co., best large Welsh smokeless steam coal, £1; through-and-through Welsh coal, 16s. 6d.; best large Staffordshire coal, 15s. 9d.; best Staffordshire nuts, 10s. 11d.; best washed Staffordshire nuts or beans, 9s.; best steam coal from the Cannock Chase or North Warwickshire district, 12s. 3d.; best bright slack, 7s. 4d.

Metropolitan Asylums Board.—The Board have received the following tenders for supply of engineers' tools, electric motor, etc., to the Western Hospital:

	£	s.	d.
H. Greene and Co., 22, Martin's-lane, E.C. (accepted)	189	9	4
Selig, Sonnenthal, and Co., 85, Queen Victoria-street, E.C.	192	19	0
G. Hatch Limited, 20 and 21, Queenhithe, Upper Thames-street, E.C.	206	4	3
J. Gibb and Co., 99, Fenchurch-street, E.C.	218	18	0
W. Newbold and Co., 107, Upper Thames-street, E.C.	227	17	6
British Electrical and Mechanical Co., 55, Barbican, E.C.	228	16	0
A. Schove, 9 and 11, Moor-lane, E.C.	232	18	0
Buck and Hickman, Whitechapel-road, E.	234	8	0
W. T. Skelding and Co., Dudley	234	11	11
Hobdell, Way, and Co., 63, Crutched-friars, E.C.	240	15	2
Britannia Engineering Co., Colchester	245	4	6
Easterbrook, Allcard, and Co., Sheffield	247	9	6
Dempster, Moore, and Co., Glasgow	249	11	6
J. Spencer and Co., Hollinwood, Lancs.	325	15	9
Tangye Tool and Electric Co., Birmingham	357	2	9
Low Moor Co., Bradford	406	3	7

Digitized by Google

Government Contract.—Messrs. Newtons, Limited, of Taunton, report Government repeat orders for two 100-kw. and two 50 kw. steam-driven dynamo sets. The two 50-kw. sets are coupled together. The engines are being supplied by Browett, Lindley, and Co. We are informed that the repeat orders for these machines are of the well-known Mawdsley type made solely by this firm, and that they are the result of satisfactory records, both as regards high efficiency and low temperature rise, of former contracts. Note.—We understand this firm are making this type of machine in sizes from ½ h.p. to 500 h.p., instead of the well-known Taunton machines previously made by them, the new machine being more suited to the requirements of consulting and central-station engineers, and in their opinion a decided step in advance of modern dynamo design.

London County Council.—Tenders have been received as follows:

(1) Wiring and fitting Lee-green fire station.

Hooper, Neary, and Co., Trafalgar-road, Greenwich, S.E (accepted)	£141	10	0
J. Defries and Sons, 146-7, Houndsditch, E.C.	155	0	0
National Electric Construction Co., 34, Victoria-street, S.W.	157	0	0
Durrell and Co., 58 Fenchurch-street, E.C.	160	0	0
R. Dawson Limited, 8 Berners-street, W.	160	0	0
F. J. Coleby and Co., 7, Thayer-street, Manchester-square, W.	164	10	0
O. Clark and Co., St. Mark's-road, North Kensington, W.	170	0	0
J. O Grant and Taylor, 63, Queen Victoria-street, E.C.	175	0	0
W. H. Johnson, 200, Upper Kennington-lane, S.E.	183	15	0
Barlow and Young, 8, London-street, Fenchurch-street, E.C.	240	0	0

(2) 34 single-deck steel cars still required for the Aldwych-to-Islington tramways:

Tenders for 34 single-deck car bodies.

Brush Electrical Engineering Co., Loughborough	£14 773	0	0
United Electric Car Co., Preston	14,790	0	0
Metropolitan Amalgamated Railway Carriage and Wagon Co., Birmingham	16 252	0	0
Hurst, Nelson, and Co., Motherwell	19,550	0	0

Tenders for 34 car trucks.

Brush Electrical Engineering Co.	3,774	0	0
Hurst, Nelson, and Co.	3,978	0	0
Mountain and Gibson, Bury	4,046	0	0
United Electric Car Co.	4,420	0	0
Peckham Manufacturing Co., U.S.A.	4,930	0	0
Metropolitan Amalgamated Railway Carriage and Wagon Co.	4,862	0	0

Tenders for the electrical equipment and assembly of 34 single-deck cars.

British Westinghouse Electric and Manufacturing Co., London	9,996	0	0
Witting, Eborall, and Co.	10,693	0	0
British Thomson-Houston Co., Rugby (alternative)	11,084	0	0
Brush Electrical Engineering Co.	11,696	0	0
British Thomson-Houston (not to specification)	10,948	0	0

Or alternatively—

Tenders for 34 single-deck cars complete.

British Thomson-Houston Co.	28 947	0	0
Ditto (alternative)	29 280	10	0
Ditto ditto	29 635	10	0
Dick, Kerr, and Co., London	29 325	0	0
Ditto (alternative)	29 818	0	0
Brush Electrical Engineering Co.	30 243	0	0
British Westinghouse Electric and Manufacturing Co.	34 170	0	0
Hurst, Nelson, and Co.	33,694	0	0
British Thomson-Houston Co. (not to specification)	28,806	10	0

Note.—On Tuesday the committee reported as follows: "It will be seen that the lowest combined tender is £399 more than the sum of the three lowest separate tenders, all of which appeared to be satisfactory. The amounts of the lowest tenders appeared to us to be somewhat large, and we, therefore, placed ourselves in communication with the Brush Electrical Engineering Co. and the British Westinghouse Electric and Manufacturing Co., the firms submitting the lowest tender for each of the three separate items, with a view to ascertaining whether they would not be prepared to make some reduction in the amount of their tenders. As a result the Brush Electrical Engineering Co. has expressed its willingness to reduce its tenders for car bodies to £14,280, but the company cannot see its way to reduce the amount for the trucks. The British Westinghouse Electric and Manufacturing Co. states that it can make no reduction in its tender for electrical equipments, but is willing to supply both the trucks and equipments and to erect the cars for an inclusive sum of £13,481. We are, therefore, of opinion that the Brush Electrical Engineering Co.'s revised tender for car bodies and the British Westinghouse Electric and Manufacturing Co.'s combined tender for trucks and equipments should be accepted." The committee submitted recommendations in accordance with these proposals. This was agreed to.

Tramways over the Bridges.—Sir Benjamin Baker recommends the widening of Blackfriars Bridge by 30ft. on the western side, and he further states that new foundations will have to be provided to sustain the increased weight. The Bridge House Estates Committee of the City Corporation approve the proposal, and have given orders for the issue of the usual parliamentary notices, provided that the London County Council assents fully to the conditions laid down in the last report of the Bridge House Estates Committee. It is estimated that the work of widening Blackfriars Bridge will occupy nearly two years.

BUSINESS NOTES.

TRACTION.

Coombe.—Steps are being taken to expedite the reconstruction of the tramway track in the district.

Weston-super-Mare.—The Council have refused permission to the electric tramways company to lay a double track along the sea-front.

York.—The City Council, we are informed, are considering a scheme for the acquirement of the local tramway service and its conversion to electric traction.

Swansea.—A correspondent complains in the local Press of the noise caused by the tramcars, and urges the adoption of an improved system of watering roads.

Liverpool.—Another accident occurred last week at the Hall-road Station—a baggage car while being shunted ran into the dead end and caused injuries to two persons.

Dundee.—In a report prepared by the manager of the tramways the suggestion is made for touching the Tay Bridge and West Stations and the Tay Ferries with the tramway system.

Yarmouth.—To meet the demands made upon them by increasing traffic, the Tramways Committee have placed an order with the Brush Electrical Engineering Co. for two additional cars.

Swanage.—The promoters of the proposed light railway from Bournemouth to Swanage have, it is stated, decided to proceed with their scheme, which is estimated to cost £200,000.

Deptford.—The Borough Council are to petition to the Board of Trade against an increase in the rate of speed of London County Council cars along some of the streets in the borough.

Crewe.—The London and North-Western Railway Co. are fitting Crewe Station with signal boxes which, it is said, contain the finest electrical equipment of any signal cabins in the world.

Glasgow.—The Tramways Committee of the Town Council at a meeting on Tuesday approved of the general manager's report, recommending that the existing car routes in the city be not interfered with.

Stalybridge.—The Tramways Committee of the Stalybridge, Hyde, Mossley, and Dukinfield Board have made an offer of £350 to the Stalybridge Corporation in full settlement of their claim for the reinstatement of roads.

Walsall.—The Tramways Committee have given instructions for an instrument for testing the armatures and insulators to be purchased at an estimated cost of £25, and for the destination curtains to be renewed when necessary.

Cheshire.—The Board of Trade have decided to confirm the order granted by the Light Railway Commissioners, authorising the construction of the Tarporley and Mouldsworth light railway subject to certain modifications in the routes.

Italy.—According to the *Neue Freie Presse*, a direct electric railway is projected between Genoa and Milan, and a committee in furtherance of the scheme has been formed under the auspices of the Banca Commerciale Italiana and of the Genoese municipal authorities.

Taunton.—The electric tramway service was resumed last Wednesday after a stoppage of about two months, during which time the track has been relaid. This formerly consisted of tar macadam, which was found to be unsatisfactory, and granite setts have been substituted.

Paddington.—The proposal made by the Borough Council that they were prepared to consider favourably the London County Council's projected electric tramway from the Marble Arch along Edgware-road to Cricklewood, providing the County Council bore the cost of street widenings, has been rejected.

Guildford.—It is stated that there is a good prospect of the Guildford and Woking light railways being commenced early next year. A new company is being formed, it is understood, to take over the powers acquired by the West Surrey Light Railway Co., and it is stated that most of the capital is already assured.

Dunfermline.—The District Committee have decided to accept £7 instead of £10 per mile wayleave to be granted to the West Fife tramways. Notice of motion was given at a Council meeting to the effect that a *plébiscite* be taken of the ratepayers as to whether they would have municipal or private company tramcars.

Durham.—The British Electric Traction Co. have obtained leave of the Board of Trade for an extension of six months. The clerk of the County Council lodged a formal objection to the extension, and the Board of Trade has stated that they would be unwilling to entertain any further application unless progress shall have been made with the works.

Lincoln.—Successful trial trips were made last Saturday on the new electric trams from the Bracebridge terminus to the Great Northern Railway crossing. A Local Government Board inspection of the system has yet to be completed, but it is hoped this will shortly be effected to the satisfaction of that body, and that soon the cars will be brought into use.

Derby.—The Tramways Committee reported at the last meeting of the Council that the receipts of the Corporation tramways for the five weeks ended Oct. 28, 1905, were £3,570. 4s. 7d., being an increase of £300. 5s. 11d., as compared with the corresponding period last year. This committee had decided to contribute to the Highways Committee the sum of £75 per annum towards the cost of watering the tramway lines.

Southend.—It was reported at a meeting of the Council that consideration of the proposed extension of the tramways system along High-street and Marine-parade would come up for consideration at a later date, together with the suggestion for a through service of cars

Digitized by Google

between Southchurch and Leigh, *via* Prittlewell, London-road, and the Middleton respectively, and also in connection with the beach section.

Greenwich.—At the last meeting of the Borough Council a report was accepted of the Highways Committee recommending that the assistant secretary of the Board of Trade be informed that the Council was not in favour of the speed of the trams exceeding a maximum of 10 miles per hour so far as the lines within the borough were concerned. It was proposed by the Board of Trade to increase the speed to 12 miles in several instances.

Falkirk.—The Falkirk and District Tramways Co. intimate that they intend to make application, by means of a provisional order, for power to extend their tramway system from Falkirk to Laurieston and from Falkirk to Grangemouth. The matter was discussed at a meeting of the Eastern District Committee of the Stirling Council, and it was ultimately agreed to appoint a committee with powers to deal with the matter and to safeguard the interests of the County Council.

Ayr.—A breakdown, which caused considerable interruption of traffic on the Corporation tramway service, occurred last week. For the third time within a short period the overhead system at the end of High-street as it enters New Bridge-street partly came down, causing a somewhat dangerous situation from the live wires. At the part that gave way the supporting wires have a long stretch, and have not the middle supports that the rest of the line has, hence the liability to give way.

Earlsheaton.—The inability of the Soothill Nether District Council to carry out their order for the construction of a tramway is causing great inconvenience to the inhabitants of this district. The Council endeavoured to transfer their powers to the Wakefield District Light Railway Co., but that company are indisposed to extend their present line. No progress has been made by the Council in their effort to dispose of the powers of the order. Negotiations are still on, but so far as can be learned they are not likely to lead to anything.

Whitworth.—It was reported at a District Council meeting held last week that if Whitworth would construct, equip, and maintain the tramway track in their district, the Rochdale Corporation would be prepared to run cars over such tramway at a cost of 6d. per car mile, with an additional 10 per cent. cost. The experts who were present at the meeting agreed that the sum of £10,000 per mile, or £40,000 in all, would have to be spent in order to satisfy Rochdale's requirements. It was decided to discuss the question in committee.

Notts.—The dangerous tram terminus at Trent Bridge is likely to be soon remedied, for we learn that instructions have now been given by the Tramways Committee for the terminus to be constructed close to the foot pavement, and the work is to be placed in hand directly the necessary cross-overs have been delivered by the makers. Looking well ahead, too, the committee have decided that when the London-road scheme is completed the terminus shall be laid close to the opposite pavement, thus leaving the centre of the road absolutely open.

North-Eastern Railway.—An action seeking for the recovery of damages for the loss of an animal caused by the animal being electrocuted was sustained in the North Shields County Court. The animal was conveyed in a truck, and while being unloaded knocked over a movable truck placed to prevent cattle from straying on to the electric line. The animal, however, walked through the gap on to the live rail and was killed. The contention of the company that in providing a movable fence they had done all that could be expected of them was not sustained.

Colchester.—The Board of Trade do not approve the plans showing the rail and sub-structure proposed to be used in the construction of the tramway along Military and Old Heath roads. It was resolved at a meeting of the Council to defer to the next meeting consideration of the tramways manager's report as to the use of tickets in lieu of boxes, and introduction of intermediate stages. Sanction has been given for the borrowing by the Corporation of £7,334. The Tramways Committee have resolved not to permit police officers in uniform to travel on the tramways without payment.

Poole.—At the final meeting of the Urban District Council prior to its amalgamation with the Urban District Council of Branksome, a report was submitted by the Tramways Committee recommending that the clerk write pointing out that the Council were still of opinion that their present by-law as to picking up and setting down passengers ought to be maintained, that through tickets from the Square to the Albert-road ought to be issued on all cars, and that the workmen in Poole and Branktome ought to be allowed to travel any 1d. stage for ½d. in the same manner as the workmen in Bournemouth.

Heywood.—Arrangements have been made by the Council with the Bury Tramways Committee whereby the latter will supply power for working the Heywood electric tram system at 1·2d. per unit in addition to the charge of 4½d. per car mile run as previously arranged. The work of reconstruction is proceeding steadily, but not so satisfactorily as could be desired. There has been some delay with the overhead equipment owing to a difficulty in obtaining the brackets, but this work is now proceeding. At the electricity works the boiler is in its position, and it is expected that the engine and other machinery will be delivered in about a fortnight.

Erith.—The Tramways Committee of the Erith Urban District Council have recommended that the attention of the London County be called to the fact that a double line of tramway from the terminus of the Council's tramways at Abbey Wood to a junction with the Bexley tramways in High-street, Plumstead, is authorised to be constructed by the Council under the Erith Tramways and Improvement Act, 1903, subject to the consent of the London County Council and the metropolitan borough of Woolwich, and that the Council is prepared to immediately construct the tramway, and asks for the consent of the London County Council to such construction.

Lowestoft.—The tramways manager reports that the number of passengers carried on the cars during the year amounted to 2,338,323, the receipts from which were £10,325 as against £10,597 for 2,372,681 passengers carried in 1904. At a meeting of the Council the question of constructing a double track from Bevan-street to the Hempland was considered and further adjourned. It has been agreed that the rateable value of the tramways undertaking shall be reduced from £943 to £350. Correspondence was read at the last Council meeting with reference to the proposed sale of the tramways and electric lighting undertaking to a private company, but the matter was allowed to drop.

Weymouth.—At a recent meeting of the Weymouth District Trades and Labour Council, held on Thursday, Nov. 2, the following resolution was carried: 'That no steps be taken to decide the question of tramways for the town of Weymouth until the question be submitted to the ratepayers of the town in some suitable hall in Weymouth." Our readers will remember that Prof. Kennedy reported fully on that scheme. At the last Council meeting this report was discussed at length and a motion was proposed in favour of scheme D, which is the biggest of the four alternative schemes submitted, which includes a line as far as Portland to cost £80,000. It was decided to refer the matter to the whole Council and committee.

Musselburgh.—It was stated at a meeting of the Town Council that the tramway company proposed to apply to the Board of Trade next month for a provisional order to extend the present system of electric trams from the Levenhall terminus along by the seashore through Prestonpans and on to Port-Seton, and the support of the Town Council, as the local authority, was requested. Some discussion ensued, in the course of which the opinion was expressed that the company should pay wayleave, and also that they ought to widen the roadway so far as it lay within the bounds of Musselburgh. Ultimately it was agreed that a special meeting of the Council be called on an early date to give consideration to the matter.

Newcastle.—A strike is threatened on the Corporation tramway system in consequence of a proposed change by which the men will work five days a week instead of six. The notice issued states that owing to alterations for winter traffic, and the reliefs for holidays being complete, the traffic department is over-staffed. In order to spread loss of employment over a larger number of men, it will be unavoidable in many cases to give more than five days work a week, which will be given in rotation. The effect will be to reduce the wages of motormen from 30s. to 25s. a week, and other grades in proportion. Close upon 1,000 men are affected, and a mass meeting is to be held to-day to consider the advisability of striking on Saturday.

Sunderland.—The secretary of the Sunderland District Electric Tramways announces that the greater part of the company's system is now in working order. The first section of about 11 miles, from Grangetown to Houghton-le-Spring (including the two branches to Penshaw Station and Fence Houses Station), having been examined and passed by the Board of Trade, was opened for traffic on June 10 last, and a further section from Houghton to Hetton of nearly two miles was opened on Oct. 20. With an average of only 10 cars (one-third of the total number) the total traffic receipts from the above dates to the end of last month amounted to £6,957. At the present time a service of 18 cars is in operation, and that number will be increased in due course. The Durham Collieries Electric Power Co., from whom this company is to take its power, are provisionally working a generating plant under agreement, but that company's complete installation should be working by at latest the end of January next, when the full service of trams can be running.

Cardiganshire.—At the meeting of the County Council the question of the proposed light railway between Lampeter and Aberayron was brought forward. Six months ago the County Council had undertaken to advance by way of loan the sum of £20,000, provided that the district councils and the other local authorities interested undertook to provide £10,000. That resolution was made operative for six months only, and that period having elapsed it was necessary to renew the undertaking. It was reported that the engineer of a firm of London contractors—Messrs. Jackson and Co.—had gone over the route and considered the prospects of financial success of that line, and his conclusions agreed with those of Mr. Yockney, the promoters' engineer, and the result was that the company were now prepared to construct the line. All the local authorities had contributed as desired, with the exception of the Lampeter Rural District Council, but this was due to a formality, which would be complied with on the following day. The Light Railway Commissioners had given the County Council to understand that the Treasury grant would be forthcoming. The question of renewing the undertaking was referred to the Finance Committee.

Torquay.—About 250 yards of the first portion of the tramway track in Newton-road, near Torre railway station, is now complete, and it is hoped, with fine weather, to rapidly finish the remaining open portions. The cutting at present extends nearly down to Castle-circus, and on this section the rails are laid practically the whole distance. The cutting of Fleet-street section is now approaching the town hall for one of the tracks, and rails are laid from the Strand to beyond Swan-street. It is anticipated that in a few days the laying of wood paving will be started on this section. It is roughly estimated that there is now an outlay of about £300 a week in the wages of the men. At the last Council meeting the town clerk reported upon the conference between the Council and the representatives of the Dolter Company, which was of a satisfactory nature. In brief, the company waive the question of the feeder cable, and extend the time to March 31 for the Corporation to supply the current. In consideration of the Council allowing them to lay the tramways on the Torbay-road, the company agree to pave the whole of the roadway in question. The report on the conference was adopted by the Council. The recom-

Digitized by Google

mendation that the application of the company be agreed to, and that the necessary agreement be drawn up, was carried.

Huddersfield.—It was reported at the annual meeting of the Borough Council that the total number of units of electricity generated at the tramways power station during the municipal year amounted to 2,892,991, which was an increase of 113,726 over the corresponding period last year. The average generation cost per unit was ·246d. as against ·249d., and the average works cost per unit, including maintenance and materials used, was ·273d. as compared with ·271d. for last year. The present rolling-stock consists of 70 cars, comprising 11 bogie and 59 four-wheeled or truck cars, and two electrically-equipped coal trucks. The present number of covered cars is 27, but the work for equipping six additional cars is in progress at the Great Northern-street depôt. During the year the cars and their equipments have been thoroughly maintained, and a number of them have been speeded up, which has enabled the services to be greatly accelerated. The system of coal haulage has made satisfactory progress, and three firms are now having coal conveyed direct by trucks from the Hillhouse coal-shoots into their mills. The overhead equipment and cables have given satisfactory results, and the monthly tests that are taken show them to be in good condition. The present service of cars is 43 on ordinary days and 56 on Saturdays. The total traffic receipts from Nov. 1, 1904, to Sept. 30, 1905, amounted to £63,222. 12s., an increase of £2,421. 7s. 7d. over the corresponding period last year. An experiment is being tried with the object of establishing a system of through cars between several termini on the Huddersfield Corporation tramway system. Should this prove successful, it is believed that a great acceleration in the service will follow.

West Ham.—The report of the tramways manager relative to the first year's working of the system of electric traction, inaugurated in February, 1904, shows that the gross revenue for the year ended March 31 amounted to £56,199, or an average per car mile of 10·9d. The estimated profit due from the North Metropolitan Tramways Co. in respect of the horse cars worked by them on behalf of the Council is £5,500. The total expenditure amounted to £37,852, or an average per car mile of 7·3d.; to this, however, is added the sum of £1,080 as being the cost of maintenance of the horse cars, and the balance carried to net revenue account amounted to £22 817, to which must be added £392 as bank interest. Interest on capital and contributions to sinking fund absorb respectively £9,020 and £4,326 of this amount, whilst £3 093 has been appropriated to the reserve or renewals fund, and £7 000 transferred to the borough fund to the relief of rates. The tramways manager, Mr. Blain, reports that from the inauguration of the system the traffic has been most satisfactory and encouraging. The number of passengers carried over a mileage of 1,240,774 miles amounted to 15 773 592, and the total receipts from this source reached the sum of £55,063, or an average per car mile of 10·68d. The total length of track (double and single) which is owned and worked electrically is 23 miles, and the total number of units required during the year amounted to 1 511,866. The working expenses reached 67 per cent. of the receipts, and the traffic revenue per car mile averaged 10·68d. There has been a marked immunity from delays to traffic breakdowns or serious accidents proceeding from causes under the control of the department, though the narrowness of many of the streets through which the tramways pass and the heavy vehicular traffic were responsible for occasional irregularities. In April, 1904, the Tramways Committee increased the rate of pay for both motormen and conductors to 7d. per hour, the former from 6½d. per hour and the latter from 6d.

London County Council.—The Highways Committee have recommended to the Council an estimate of £803,600 for the conversion of the present horse tramways into an electrically-equipped system, at present running along the following routes: (*a*) Theobalds-road terminus to London Docks; (*b*) Norton Folgate to Stamford Hill; (*c*) Aldgate terminus to Poplar; (*d*) Moorgate-street terminus to junction with Old-street; (*e*) Holborn terminus to junction with Theobalds-road; and (*f*) along Old-street between Great Eastern-street and Shoreditch. It is hoped to complete the reconstruction of this section of the tramways by Christmas, 1906. The system to be adopted is the underground traction, and details have been approved by the Board of Trade. In order that the reconstruction and equipment of the first section of the lines may be proceeded with as little delay as possible, the committee recommend that tenders be obtained for the track work and rolling-stock, cables, ducts, plant, etc., at an estimated price of £665,600. The Finance Committee submitted a report at the meeting on Tuesday last on the proposal of the Highways Committee to obtain parliamentary sanction to acquire property for the making of a station under Wellington-street in connection with the underground tramways under Aldwych. They point out that the total expenditure sanctioned for the subway was £317,000, but they understood that some saving is expected on the original estimate for construction. It is estimated that a further sum of £37,000 will be needed for the acquisition of property and the necessary works now contemplated, and this will increase by about £1,920 a year the charges against the tramway revenue for interest on and repayment of debt. It appears to the committee a large sum of money to expend for this purpose. The Highways Committee report that the total tramway traffic receipts from April 1 to Nov. 4, 1905, were £375,112 from lines worked by electrical traction, and £99,505 from lines worked by horse traction, or a total of £469 617. The receipts for the corresponding period in 1904 under the same heads were £321,937, £81,093, and £403,030 respectively. These figures are not exactly comparable owing to the purchase of undertakings, the extension of lines, and the conversion of routes from horse to electric traction.

Croydon.—The Council have considered and adopted the following report of the Tramways Committee: "The committee received a certificate from the borough road surveyor stating that tramway No. 20, authorised by the Croydon and District Electric Tramways Act, 1902, has been duly constructed and equipped. The town clerk reported that the draft lease of the said tramway was, on the 18th September last, sent to the British Electric Traction Company, Limited, for perusal, and that the draft lease not having been approved by the company, an application was made to the arbitrator appointed under the Croydon and District Electric Tramways Act, 1902, for an appointment to settle and determine the form of the lease between the parties. The arbitrator sat and heard the parties on the 26th October, when, after a number of questions had been raised on behalf of the company, the arbitration was adjourned until the afternoon of Thursday, the 9th November inst. In consequence of the position taken up on behalf of the company at such hearing, the committee are advised and now recommend the Council to pass the following resolution—viz.: 'That the town clerk do inform the British Electric Traction Company, Limited (as the fact is), that the tramway referred to in the Croydon and District Electric Tramways Act, 1902, as tramway No. 20 has now been constructed and equipped in accordance with the provisions of that Act. And the Corporation do offer and require the British Electric Traction Company, Limited, to accept such lease as in the said Act mentioned of the right of user of the said tramway No. 20, and of demanding and taking tolls and charges in respect thereof for a term of 21 years from the 16th day of November, 1905, determinable by the Corporation as in the said Act mentioned. And that such offer and requirement be signed by the town clerk and served upon the said company accordingly. And that the town clerk do also inform the said company that as from the said 16th day of November, 1905, the said tramway No. 20 will be at the disposal of the said company, and that in the event of the said lease not having been previously granted the said company will be entitled as from that day to the right of user of the said tramway and taking tolls and charges in respect thereof in the same manner and subject to the same conditions and stipulations as if such lease had been actually granted.'"

LIGHTING AND GENERAL.

Derby.—It is proposed to light the market hall by electricity.

Wembley.—There is a movement to introduce Post Office telephones into the district.

Southgate.—The Urban District Council contemplate the erection of a dust destructor.

South Bank.—The Urban District Council have decided to apply for the extension of the electric lighting order.

Thornhill.—The proposal to apply for an electric lighting provisional order has been deferred for the present.

Kirkcaldy.—Mr. Oliver Melville has been instructed to provide a 6½-h.p. motor for the high school at a cost of £40. 4s.

Alloa.—The supplementary agreement with the British Electric Plant Co. has been signed, and came into force on the 15th inst.

Uffculme (Devon).—We understand Messrs. Fox and Co. contemplate putting an electrical installation into their woollen factory.

Willans and Robinson.—Prior to the payment of interest, the debenture registers and transfers will be closed until Nov. 30 inclusive.

Sowerby Bridge (Yorks).—The work in connection with the Urban District Council's electricity supply undertaking is now in progress.

Hereford.—The output of current for the quarter ending Sept. 29, 1905, was 28 885 units, against 20,758 units in the corresponding quarter of 1904.

Southport.—On Friday the mayor opened a large electrical exhibition which is being held under the auspices of the Corporation, and which will close to-night.

Romford.—An application is to be made for an extension of time relative to the electric lighting order transferred to the Empire Electric Lighting and Power Co. in 1903.

Morecambe Tramways Co.—The annual report recommends a dividend of 4 per cent., as compared with 3½ per cent. last year. Receipts from fares are slightly higher.

New Issues.—W. T. Henley's Telegraph Works Co. are issuing £150,000 of 4½ per cent. first mortgage debenture stock, forming part of a total authorised issue of £300,000.

Chester-le-Street.—The Rural District Council have rescinded a former resolution refusing consent to the County of Durham Electric Power Supply Co. to the carrying of overhead mains.

Preesall (near Preston, Lancs.).—The United Alkali Co. are, we understand, substituting electric motors for steam driving throughout their works. They have their own generating plant.

Calverley (Yorks).—We note that the Yorkshire Power Co. are making arrangements to supply the urban district of Calverley, near Leeds, with electricity. Installation work should follow.

Ramsgate.—An electrical and trades exhibition is being held, and will remain open until Nov. 28, at the Royal Victoria Pavilion, under the auspices of the Ramsgate and District Electric Supply Co.

Partnership.—Particulars of an opening for an electrical engineer with some capital and experience as junior partner in Glasgow branch of a high-class firm of electrical engineers appear in another column.

Hexham-on-Tyne.—It seems that the Hexham and District Electric Supply Co. have got under weigh with their scheme, and are now putting down a plant for the supply of electricity in the urban district.

Fire.—It is reported that a four-storey building, occupied by Dunlop Rubber Co., was destroyed by fire at Birmingham early on Friday morning, heavy fog preventing discovery until the flames had obtained a good hold.

Trowbridge.—We understand that the difficulties of the Urban District Council with the Western Electric Distributing Corporation

Digitized by Google

relative to the costs of transfer of the order have been referred to Mr. G. Pearson, of Bristol.

Yarmouth.—In consequence of an application by the Education Committee for the electric light to be installed at the new school at Southtown, the Council have offered to fix and keep in repair 50 25-c.p lamps for £3 3s. per lamp per annum.

British Aluminium Co.—The directors have decided to pay an interim dividend for the half-year ended June 30 at the rate of 6 per cent. on the "A" preference shares and 7 per cent. on the 7 per cent preference shares payable 2nd proximo.

Ashton.—The application of the Great Central Railway Co. for a supply of current for lighting the new station at Guidebridge and power for the repairing shop has been referred to the Works and Management Sub-Committee, with power to act.

Olympia Exhibition.—We have received from Messrs. A. Reyrolle and Co., Hebburn-on-Tyne, an elegant souvenir descriptive of their motors, and we are informed that they will be pleased to forward a copy to any of our readers who may apply for the same.

Stepney.—The Council are taking up a loan of £3,770 for the provision of storage tanks, water-softening plant, etc., at the electric lighting station. The Council will support the Poplar Council's action with regard to the wiring of consumers' premises.

Sussex Telephones.—The National Telephone Co. are laying pipes underground for the necessary cables to supply subscribers in Southwick, and the work will be continued to and throughout Shoreham. Work has also been started at Henfield and Burgess Hill.

Dumbarton.—A petition of the Electric Supply Corporation, Salisbury House, London-wall, E.C., for consent to the erection of an electric generating station, a car-shed, offices, and sheds, and also for diverting the mill lade, is before the Dean of Guild Court.

Brandon.—An application from the County of Durham Electrical Power Distribution Co. for consent to an application for a provisional order for the supply of electrical energy in the Council's district will come before the next meeting of the Urban District Council.

Barnstaple.—Messrs. Edmundson's have decided to open a branch at Barnstaple, and have secured a shop, showroom, etc. The branch will be worked in connection with Ilfracombe, where Mr. Alan Jenkins is the manager. The local manager at Barnstaple will be Mr. F. Williams, who has been engaged with the firm at Ilfracombe.

Agencies.—Mr. R. Salem, of 71, Bishopsgate-street Within, E.C., has been appointed sole representative for London and the South and South-East of England for William Sanders, Wednesbury.—The Rhodes Electrical Manufacturing Company have appointed Messrs. R. A. Fullerton and Co., of 116, Hope-street, Glasgow, as their sole agents for Scotland.

Swansea.—The Swansea, Mumbles, and Morriston telephone exchanges are being interconnected, but, we are informed, intercommunication will be strictly local to each place, and will not extend from one place to another, and will not extend to the numerous other exchanges in the extensive system of the National Co. in the Swansea area.

Newport.—The proposed reductions in the charges for electricity and electric light have been approved by the Town Council, who expect an increase in the number of consumers to compensate for the estimated loss of £1 000 following from the new departure. Various suggestions for the lighting of York-road and Kensington-avenue are under consideration.

Frimley.—An application of the Camberley Electric Supply Co. for consent to an application to the Board of Trade for an electric lighting provisional order will shortly come before a committee of the Urban District Council. The company propose to charge on the maximum demand system at 7d. to 3d. per unit, making an average cost of 4½. to 5½. per unit.

Hammersmith.—At the inquest into the death of an employé at the electricity station a verdict of accidental death was returned. It was found that the workman had neglected to use the rubber gloves provided for him, and that he died from the effects of a shock received in removing an ammeter from a switchboard while standing with one leg on the chair and the other on the mat.

Chelmsford.—The Corporation have accepted a tender for lighting the public streets from the Chelmsford Electric Lighting Co. as follows: for each arc lamp (21 of 1,000 c.p. each), £25. 5s. per annum; for each incandescent lamp (231 of 70 c.p. each, except at corners where they are to be of 150 c.p. each), £3. 3s. The fines now charged for lamps unlighted to be doubled.

Hull.—A few weeks ago we referred to the municipal telephone system as a paying concern. Recent accounts show a profit after paying all interest on loan, sinking fund charges, and plant kept up out of revenue. So far the system has not cost the ratepayers a single penny, and it is stated that the subscribers in Hull are saving over £10 000 this year in reduced charges alone.

Stafford.—An application from the Postmaster-General for permission to erect an overground telegraph line along the main road, from the junction with the Tean Uttoxeter-road, at Fole, to Rocester, *via* Hollington, thence from Rocester through Benstone and Ellastone to the junction with the boundary of the Mayfield Rural District Council at Middle Mayfield, has been agreed to.

Macclesfield.—The estimated capital outlay on the electricity scheme as prepared by Mr. Woodward, which has been approved, includes the following: buildings, £3 700; generating plant, £8 000; mains, £3 700; consumers' connections, £600—total, £16 000. The plans of Mr. Bradburn, architect, of the building and the chimney to be erected on the Bowling Green yard site, have also been approved.

London Gazette.—The partnership between Joseph Grain, jun., and Percy Hopper, carrying on business as electrical accessory dealers and sundriesmen at 92, Northumberland-street, Newcastle-on-Tyne, has been dissolved by mutual consent. Notices appear of applications to the Board of Trade by the Wisbech Corporation for extension of time and by the Frome Urban District Council for transfer of their provisional orders.

London County Council.—At the meeting on Tuesday tenders were received for the supply, delivery, and erection of self-discharging steel coal trucks for use at the Greenwich generating station. It was agreed to lend the Poplar Borough Council £2 497 for electric lighting purposes. The Finance Committee submitted a report in which they argued against the Council undertaking the work of a bulk supply of electricity. We deal with the result in another column.

Colchester.—The last report of the engineer gives the following figures: output of electricity for lighting during September, 1905, 42,376 units, against 39 304 the corresponding week of 1904, and 28 705 in 1903; for traction, 35 675, against 36,405 in 1904; used in generating station, 4 057; number of consumers at end of September, 778, against 551 in 1904 and 347 in 1903; total number of 8-c.p. lamps connected, 34 530 against 27,159 in 1904. Four electric lamps are to be erected, and a Nernst lamp substituted for a gas lamp.

Erith.—An extension to Northumberland Heath is to be made at a cost of £295. In answer to an offer from the borough of Woolwich to supply electricity in bulk, the Council have replied that they do not at present require a supply of electricity in bulk, and that they will communicate with the Woolwich Borough Council if such a supply is required at any future time. The question of revising the present scale of charges for the supply of current for heating and power purposes has been referred to the resident electrical engineer to report.

St. Albans.—Consent has been given to the Postmaster-General to lay a line of underground telegraph wires from the post office to the city boundary on St. Stephen's-hill, and negotiations are going on with a view to an alternative route being decided upon in the place of a proposed line of overground wires from the post office along to the city boundary in the Sandridge-road, which would involve the erection of a number of poles. The electric lighting agreement with the St. Albans District Electric Supply Co. has been approved by the Board of Trade.

Lowestoft.—The resident engineer's last report states that during the month six new consumers have been connected to the mains, representing 221 8 c.p. lamps. There are now connected to the mains 658 consumers, representing 33,416 8 c.p. lamps. During the year 105 new consumers have been connected, representing 5 800 8-c.p. lamps. The engineer is about to report upon the cost of lighting Christ Church clock by electricity. The charges for current for tramway purposes for the year ending Sept. 30, 1906, have been fixed at 2d. per unit, with the proviso that at the end of the year the charge shall be again considered.

Morley.—The borough electrical engineer, Mr. J. E. Ellis, in his last report states that the output of electricity during the month ending Sept. 30 was 11,727 units, against 12,004 the corresponding month last year, the decrease in the output being 277. The actual units sold to consumers by meter was 7,8?9, against 6 313 the same month of last year, showing an increase of 1,496. There were 123 lamps connected during the month, and the total number of lamps connected to date was 13,124. During the month one ½-h.p. motor had been coupled to the mains, which was working very successfully, which brought the total motors connected to the mains up to six, equal to 27½ h.p.

Scunthorpe.—An inquiry has been held into the application of the Urban District Council for sanction to borrow £4,500 for electric lighting purposes. The Council are already engaged in a scheme of electrical pumping for their new waterworks, and are anxious to combine an electric lighting plant, and also to keep out any private company who might seek powers for supplying electrical energy. The contract for the work has been provisionally accepted by the British Westinghouse Electric and Manufacturing Co. Mr. Cobban, the engineer for the scheme, said it was expected that a profit of £41. 6s. 7d. would be made on the first year's working. It was also intended to light the principal streets with 16 c.p. lamps.

Cannock.—The Shropshire Electric Power Co. are prepared to enter into an agreement to supply to the Council electricity as they require at a rate of 2½ d. per unit, or if taken in continuous demand at a rate not exceeding ¾ d. per unit. Sanction to a loan of £3 000 will be applied for so as to purchase the necessary accumulators and mains and carry out the works enabling the Council to distribute this within the Cannock area, exclusive of Bridgtown. The Council can supply at 4½ d. per unit. The 3d. per unit charged to the Council includes the redemption fund and cost of maintenance and distribution. On sanction being obtained, an agreement will be prepared with the Shropshire Electric Power Co. for the supplying of electricity on the terms named.

Mill Installation.—The distinction of possessing one of the oldest electrical installations in the West Riding of Yorkshire falls to Messrs. W. Fison and Co., whose Greenholme Mills at Burley-in-Wharfedale were equipped as long since as 1889, at a cost of about £3 500. Additions have been made to the plant from time to time, and it now comprises one horizontal slow-speed engine of 100 h.p., and two similar engines of 30 h.p., coupled through counter shafting and belts to seven dynamos, ranging in capacity from 40 kw. to 20 kw. The latter were supplied by Messrs. Crompton and Co. and the Phœnix Dynamo Co., and are direct-current machines used in conjunction with accumulators. This plant supplies current at 110 volts pressure to an installation of 1,500 16-c.p. and 32-c.p. incandescent lamps and three 10 h.p. motors. The maximum load obtained is 93 kw., while the units generated per annum total about 60 000. Naturally, the plant is now somewhat antiquated, hence the intention of the above firm to replace it with an entirely new and up-to-date equipment in the near future.

Digitized by Google

Walsall.—The last report of the Electricity Committee was as follows: "The total number of consumers supplied on Oct. 31 last was 435. During the past month the total units generated at the station were 157 390. The total output from the main generators was 152,383 units. The total units from the transformers were 120,025 (estimated). The machinery was run for 735 hours. The wages paid amounted to £132. The electrical engineer has been requested to report on the application of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. for the approval of the Corporation to the company promoting a Bill for conferring powers upon them (*inter alia*) to furnish the Corporation with electricity in bulk, and with the consent of the Corporation to supply manufacturers with current for trade purposes."

Hammersmith.—The loan of £13,700 for boilers and fittings, steam-piping, and auxiliary apparatus in connection with the extension of the electric lighting installation will now be taken up, and application is to be made for £15,570 for work executed since the last loan was applied for (February, 1904), and for work in course of execution or shortly to be executed, as follows: mains and sub-stations, £7 898. 12s. 8d.; laying services to consumers' premises, £3 569 4s. 9d.; erection of buildings, £4,103. The last report of the Electricity and Lighting Committee shows that the premises of 19 additional consumers, representing a maximum of 805 8-c.p. lamps, have been connected to the mains, that nine consumers have been disconnected, and that the present number of consumers taking current from the mains is 1,715. The Council will support the London County Council's Wiring Bill. A high-tension main is to be laid at a cost of £94.

Curtis Turbines.—The British Thomson-Houston Co., Rugby, report that the sales to date of Curtis turbo-generators amount to a total of 24,000 kw., of which 11,750 kw. have been delivered and put in service in various stations in the United Kingdom. The principal orders show a total of ten 1,500 kw. sets, four 1,000-kw. sets, and four 750-kw. sets. The Curtis turbine rights in America are owned by the General Electric Co., of Schenectady N.Y., who have received orders to date for 472 machines, aggregating 454,886 kw., of which 282 machines, aggregating 237,775 kw., have been delivered and are in use or in course of erection. Four sets of 8,000 kw. are under construction, and it is interesting to note that these will be the largest steam turbo generators in the world. The list of orders also includes 30 5,000-kw. sets, 11 3,000-kw. sets 31 2,000 kw. sets, 31 1,500 kw. sets, of which 15 5,000-kw. sets, 7 3,000-kw. sets, 16 2,000-kw. sets, and 23 1,500-kw. sets have been delivered.

Rubber in Ceylon.—A correspondent writes to the *Globe* that this year's seed crop of Hevea brasiliensis in Ceylon has been a bumper crop, and that on one estate over six million seeds were harvested and sold this year. At 200 trees per acre, this will plant 30,000 acres. The writer continues as follows: "From the first few plants in Ceylon all the millions of trees in India, Burma, Assam, Malay States, Straits Settlements, Borneo, Java, Fiji, Samoa, Madagascar, Gold Coast, etc., have been obtained. Ceylon is the most enterprising planting country in the world." We admit the last sentence, and have always admired the pluck the Ceylon planter has repeatedly shown under adverse circumstances, but with regard to the other statement, the writer appears to have forgotten the seedlings introduced into India from the Amazon by Mr. Wickham, acting as special commissioner to the Indian Government for this purpose.

Huddersfield.—The annual statement of the electricity department for the year ending Dec. 31, 1904, shows a surplus balance of £3 875; £2,110 was taken from the depreciation fund to enable the department to repay to the borough fund the amount of £5 985 which had been provided to meet deficiencies during the first three years' working of the undertaking. The capital expended upon the department at the end of last year was £175 972. There has been repaid and contributed to sinking fund for repayment of capital the sum of £39 530, leaving a balance of capital to be repaid of £137,442. An additional amount of £9,743 is included in the depreciation and contingencies account. During the present year there have been 197 additional consumers connected, with 12 768 8-c.p. lamps. This brings the total consumers to 2,196, with 150,401 lamps connected. Owing to the increased output, the conditions of working are steadily improving. In 1894 the capital expended equalled £3 per 8-c.p. lamp connected; it was at the end of last year only £1. 5s. 1d. In July the price for energy for lighting purposes was reduced from 4½d. to 4d. per unit. This will represent a loss in revenue of about £2,400 per annum, in addition to the loss of about £800 due to the reduction of meter rents. During the year the mains have been extended to Golcar, and from Milnsbridge to Longwood, interconnecting the Crosland Moor district with the Longwood district. Mains have also been extended considerably to various parts of the borough where a supply has been required.

Birmingham.—At the new electric generating station of the Corporation, now in course of erection in Summer-lane, the chairman of the Electric Supply Committee (Mr. Councillor Ellaway), accompanied by the committee, last week proceeded to the top of the chimney stack, where he laid the last brick and completed the chimney. The chimney has been designed to deal with the flue gases produced by boilers having a capacity of about 20,000 h.p., and is the first of two similar chimneys that will be required for the ultimate capacity of the generating station. The chimney has been built by Messrs. W. Sapcote and Sons, the first brick having been laid on Dec. 14, 1904. It has therefore taken 11 months to complete; the work, however, was delayed some 3½ months on account of bad weather. The leading dimensions of the chimney are as follows: height from the base, 249ft. (225ft. from floor level); internal diameter, 15ft.; external diameter at bottom, 24ft.; external diameter at top, 17ft. 4in.; total weight of chimney, 2,750 tons; approximate number of bricks used, 500,000. As far as capacity is concerned, this chimney is the largest that has been built in Birmingham, and it is pleasing to note that the whole of the work in connection with it has been carried out without any hitch whatever, and has proved to be highly satisfactory in every respect. It is anticipated that the chimney will very shortly be put to work, as four of the boilers are now completed. It is proposed to raise steam in them for the first time in the course of the next six weeks.

Buxton.—At last week's inquiry into an application of the Urban District Council for sanction to borrow £4,000 for purposes of electric lighting, Mr. J. W. Leeming, electrical engineer, submitted the following report: "In 1901 the Council applied for a loan of £35,000—£16 520 for immediate expenditure, the remaining £8 480 would be required at an early date—but sanction was only granted for the £16 520, the remainder to be applied for when necessary. Of the £4,000 now being applied for, £1,000 is down for capital overspent—viz., £90 in excess of original loan charged to subsequent loan, £669 on buildings, £661 on machinery, £837 on mains, totalling £2,259—and £1,261 of the item set against machine tools, contingencies, sundries, etc., has not been spent, this making a balance of £997 overspent. The only item for immediate expenditure is £900 for a gas-engine plant for charging the batteries, as at certain periods of the year this very soon gets exhausted, which necessitates running up steam and using the boilers and machinery only partially loaded, and therefore very uneconomical running. The extra cost of charging the battery under the present conditions comes out at about £180, and the estimated cost with the gas-engine works out at about £95, showing a saving of about £87, and after deducting the interest, etc., on capital expenditure of the gas plant—viz., £66. 5s.—it shows a net saving of £30. 15s. per annum. This does not account for dark days, storms, etc., when I find it necessary to rush up steam as quickly as possible, which, of course, puts undue strain on the boilers, and on many occasions, before I could get steam enough to start, the voltage on the town had completely gone. This would all be avoided with a gas-engine, as it would be ready and running in a very short time, and save all the coal, labour, and time, and severe wear and tear on the boilers. The remaining £3,100 is for meters, service cables, extensions to distributors, and sundries that are estimated requirements during the next three years or so."

Gravesend.—The engineer's report on the quarter ending Sept. 30, 1905, contains the following figures: units supplied to tramway company, 118 912; corresponding quarter, 1904, 122,273; units supplied to private consumers, 35 621 (corresponding quarter, 1904, 28 792); units supplied for public lighting, 18 898 (corresponding quarter, 1904, 17 499); units used on works, 25 485 (corresponding quarter, 1904, 24 694); units unaccounted for, 18 116 (corresponding quarter, 1904 20,038); units generated, 218,032 (corresponding quarter, 1904, 213 296). It has been decided that the G-type lantern supplied by the Reason Manufacturing Co., as fixed opposite the Coach and Horses, Parrock-street, should be adopted as a standard. The engineer has recommended the erection of a 300 kw. steam generator, designed more especially to deal with the tramway load but capable of handling economically either lighting or traction loads. The two propositions available were: (*a*) a vertical cross compound condensing set, fitted with Corliss valves and running about 100 r.p.m.; (*b*) a Belliss vertical triple-expansion condensing set with piston valves and automatic expansion governor running about 350 r.p.m. Both schemes included pipework, condensers, separator, purifier, air-circulating, water, and lift pumps, additional switchboard, and connections. The cost of scheme (*a*) would be approximately £6,840, and that of scheme (*b*) would be approximately £5 410. The Electricity Committee considered that scheme (*a*) was slightly more economical in operation than scheme (*b*), but not sufficiently so to justify the additional capital expenditure involved. It had a further disadvantage in that rather more than double the floor space would be required, floor space which at some no very distant date would be very valuable. On the whole, scheme (*b*) was most suited to the requirements of the Council and the one the engineer recommended them to adopt. The adoption of scheme (*b*) as suggested would enable the existing lighting load to be doubled. It has been decided that the whole of the building scheme be carried out, that the plant mentioned in scheme (*b*) be purchased, and that immediate application be made for sanction to borrow £7,000 for this purpose.

PROVISIONAL PATENTS, 1905.

Nov. 6.

22628. Improvements in rails for track purposes. Horace Louis Petit Boot, Electricity Works, Tunbridge Wells, Kent.

22631. Improvements in sliding contact pieces for Wheatstone's bridges and potentiometers, and in the arrangement of wire for the same. Franke Herbert Parker, 72 Greenvale-road, Eltham, Kent.

22635. Improvements in electric glow lamps. John Ellis, Keynsham, Sandown, Isle of Wight.

22636. Clock for connecting and disconnecting the electric current in an automatic way. Max Neumann, 12, Bahnhofstrasse, Bremen, Germany.

22654. An improved method of and apparatus for equalising the output of main dynamo-electric generators supplying energy to a fluctuating external load. Arthur Pemberton Wood and the Lancashire Dynamo and Motor Company, Limited, 34, Castle-street, Liverpool.

22660. Improvements in the method of and apparatus for producing electricity by means of steam. Henry Ernest Fry, 24, John-street, Bedford-row, London.

Digitized by Google

22673. **Improvements in electrical storage batteries.** Alfred Elmore Knight, 11, Southampton-buildings, London. (Date applied for under Patents Act, 1901, Nov. 16, 1904, being date of application in United States.) (Complete specification.)

22710. **Improvements in or connected with the manufacture of electric cables.** Darwin Bates and Arthur Hugo Schültz, 15, Water-street, Liverpool.

22721. **An improved electric candle lamp.** Charles Clare Regnart, 29, Anson-road, Cricklewood, London.

22723. **Improved means for regulating the speed of electric motorcars.** Louis Kriéger and Compagnie Parisienne des Voitures Electriques (Procédés Krieger), 24, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Dec. 1, 1904, being date of application in France.) (Complete specification.)

22724. **Improved means for regulating the speed of electric motorcars.** Louis Kriéger and Compagnie Parisienne des Voitures Electriques (Procédés Krieger), 24, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Dec. 3, 1904, being date of application in France.) (Complete specification.)

22733. **Improvements in electric safety fuses.** Ernest Francis Moy, Percy Henry Bastie, and Ernest F. Moy, Limited, Greenland-place, Camden Town, London.

22740. **Improvements in and relating to the electrolytic deposition of metals.** Sherard Osborn Cowper-Coles, 70, Chancery-lane, London.

22741. **Improvements in or relating to indicators for ships, electric signal and similar lamps.** Thomas Harrison and Anthony Strong Frazer, 70, Chancery-lane, London. (Complete specification.)

Nov. 7.

22763. **Improvements in apparatus for moving electrically the points on electric tramways and railways.** Joseph Patrick Tierney and John Malone, 44, Booterstown-avenue, Booterstown, co. Dublin.

22767. **An improvement in or in connection with electric wiring.** Edward Arthur Hall, Gough-chambers, Savile-street, Hull.

22802. **Improvements in or relating to high-tension magneto-ignition systems.** George Herbert Smith, 306, High Holborn, London. (Albert Paul Louis Boulanger, France.)

22819. **Improvements in communicating signals telegraphically.** Frederick Howe Hadfield, Clun House, Surrey-street, Strand, London.

22820. **Improvements in omnibus electrical signalling circuits, particularly applicable in telephony.** Charles Mark Jacobs, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

22841. **Improvements in and relating to electric traction.** Michaelangelo Cattori, 7, Southampton-buildings, Chancery-lane, London. (Complete specification.)

22856. **Improvements in and relating to electric switches.** The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

Nov. 8.

22874. **Improvements in printing telegraphs.** Leo Kamm, 27, Powell-street, Goswell-road, London.

22889. **Improvements in electrical contact breakers.** Reginald Masters Smith, 1, Broad-street-buildings, Liverpool-street, London.

22899. **Improvements in and relating to dynamo-electric machines.** Karl Krafft, 94, Avenue de la République, Paris.

22939. **Improvements relating to electric control apparatus.** Daniel Bacon, 7, Southampton-buildings, Chancery-lane, London. (Complete specification.)

22946. **Improvements in or relating to self-lubricating brushes for dynamos or the like.** Louis Boudreaux, 111, Hatton-garden, London. (Date applied for under Patents Act, 1901, Nov. 11, 1904, being date of application in France.) (Complete specification.)

22952. **Improvements in alternating electric currents and in methods of controlling the same.** The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

22954. **Improvements in contact breakers for the electric ignition gear of internal-combustion engines and the like.** George Charles Reed, 70, Chancery-lane, London.

Nov. 9.

22970. **Improvements in dynamo-electric machinery.** Walter Leo Hildburgh, 18, Southampton-buildings, Chancery-lane, London.

22971. **Improvements in current collectors for dynamo-electric machines.** Walter Leo Hildburgh, 18, Southampton-buildings, Chancery-lane, London.

23005. **Improvements in electric fusible cut-outs.** Herbert Henry Berry, Uplands House, Chase Ridings, Enfield, Middlesex.

23016. **Improvements in magnets, magnetic drilling posts or braces, and the like.** Andrew Stewart, 10, Livingstone-mansions, Queen's Club-gardens, West Kensington, London.

23035. **Improvements in arc lamps.** Adolfo Hess, 47, Lincoln's-inn-fields, London. (Complete specification.)

Nov. 10.

23058. **Improvements in magneto machines for use in connection with ignition systems of electrically-fired internal-combustion engines.** The Electric Ignition Company, Limited, and Frederick Harold Hall, 24, Temple-row, Birmingham.

23075. **A new or improved electromagnetic power hammer, drop stamp, or press.** Thomas Henry Large, 154, St. Vincent-street, Glasgow. (Complete specification.)

23077. **Improvements in process of electric welding.** Laurence Sylvan Lachman, 28, New Bridge-street, London. (Date applied for under Patents Act, 1901, Nov. 17, 1904, being date of application in United States.) (Complete specification.)

23085. **Improvements in and relating to systems of connections for telephone offices with separated plug service and group calling.** Deutsche Telephonwerke R. Stock und Co., G. m. b. H., Thanet House, Temple Bar, London. (Date applied for under Patents Act, 1901, Nov. 10, 1904, being date of application in Germany.) (Complete specification).

23087. **Improved manufacture of incandescence bodies for electric lights.** Siemens und Halske Akt.-Ges., Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 15, 1904, being date of application in Germany.) (Complete specification.)

23088. **Improved manufacture of glow lamps with incandescence bodies of tungsten, molybdenum, or similar metals.** Siemens und Halske Akt.-Ges., Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 15, 1904, being date of application in Germany.) (Complete specification.)

23099. **New and improved means of communication for telephony and telegraphy without wires.** Charles Brindley Mills and Edwin James Humby, 40, Chancery-lane, London.

23130. **Improvements in electrical cables.** Willoughby Statham Smith, 24, Southampton-buildings, Chancery-lane, London.

23132. **Improvements in magneto-electric ignition apparatus for internal-combustion engines.** Frederick Richard Simms and Robert Bosch, 4, South-street, Finsbury, London. (Complete specification.)

23138. **Improvements in the electrolytic refining of copper.** The Metals Corporation, Limited, and Sherard Cowper-Coles, 70, Chancery-lane, London.

Nov. 11.

23153. **Electric current transformer.** Harry Chapman, 34, Meerabrook-road, Sheffield.

23172. **Improvements in or relating to electro-mechanical systems for the propulsion of automobiles.** Henri Pieper, 24, Temple-row, Birmingham. (Date applied for under Patents Act, 1901, Sept. 29, 1905, being date of application in Belgium.) (Complete specification.)

23197. **Improvements in and relating to appliances for the movement and control of distant levers and switches by electricity.** William Schofield, 25, Woodend-street, Springhead, Lees, near Oldham. (Complete specification.)

23211. **Improved system for producing electric vibrations of different phase.** William Phillips Thompson, 6, Lord-street, Liverpool. (Gesellschaft für drahtlose Telegraphie m. b. H., Germany.) (Complete specification.)

23231. **A new or improved electrical fog signalling apparatus for railways and the like.** George Greetham, 9, Regent-street, London. (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 30.

1904.

24788. **Electric arc lamps.** Whitney. (Date applied for under International Convention, Nov. 16, 1903.)

25764. **Electric motor controllers.** British Thomson-Houston Company, Limited. (General Electric Company.)

26295. **Electric control systems.** British Thomson-Houston Company, Limited. (General Electric Company.)

27211. **Protection of electric distribution systems.** British Thomson-Houston Company, Limited. (General Electric Company.)

27352. **Electric controlling apparatus.** Otis Elevator Company, Limited. (Otis Elevator Company.)

27444. **Electric switches.** Eckstein and Krause.

28787. **Electrical switches.** Stern and Greene.

29107. **Telephones for diving and like purposes.** Davis and Graham.

1905.

1670. **Alternating electric current motors.** British Thomson-Houston Company, Limited. (General Electric Company.)

2310A. **Electric switches for controlling brake apparatus or systems.** Fairweather. (National Electric Company.) (Date applied for under Rule 5, Patents Rules, 1905, Feb. 6, 1905.)

4097. **Electromagnetic devices.** Pape and Bender.

NOTES.

The Electrical Engineers (R.E.) Volunteers.—The annual regimental dinner of the Electrical Engineers' Section will be held on Saturday next, Nov. 25, at 7 p.m., in the Café Monico, Piccadilly-circus, W.

Simplon Tunnel.—We gather from the *Proceedings* of the Swiss Federal Council that it has been definitely decided to work the interior of the tunnel from the commencement electrically. The opening has been fixed for May 1, 1906.

North-Eastern Railway.—It is anticipated that the new high-level bridge connecting Newcastle-on-Tyne and Gateshead will be completed in the course of next year, and by carrying the main traffic, will leave the old bridge free for local service and enable electrification of the southern line to be proceeded with.

Royal Meteorological Society.—The council of this society have awarded the Symonds gold medal to Lieutenant-General Sir Richard Strachey, R.E., G.C.S.I., F.R.S., in recognition of the valuable work which he has done in connection with meteorological science. The medal will be presented tt the annual general meeting of the society on Jan. 17, 1906.

Newcastle Local Section.—The members assembled last Thursday on the occasion of the sixth annual dinner of the local section of the Institution of Electrical Engineers. Dr. W. M. Thornton, chairman of the Newcastle Section, presided, and he was supported by the mayor of Newcastle (Alderman J. Baxter Ellis), Sir Isambard Owen, the Hon. G. L. Parsons, Mr. Gerald Stoney, Mr. Ernest Hatton (manager, Newcastle tramways), and a number of gentlemen prominently connected with the electrical industry in the district.

North-East Coast Institution of Engineers and Shipbuilders.—The first general meeting of the twenty-second session will be held in Newcastle-on-Tyne (in the lecture hall of the Literary and Philosophical Society) this evening. After the formal business has been transacted, a reception will be held by the president (Lord Armstrong) and Lady Armstrong, to be followed by the reading of a paper by Mr. C. Schofield on "Pneumatic Tools as applied to Ship Construction, and their advantages to Shipbuilders and Engineers." The institution dinner will be held on Friday, Dec. 1.

Manchester Local Section (I.E.E.).—The inaugural meeting of the present session took place on the 17th inst. at the Grand Hotel. Mr. S. L. Pearce, the chairman, delivered his presidential address (which we deal with elsewhere), for which Mr. T. L. Miller moved a vote of thanks, and incidentally told a tale about the recently improved conditions in the Lower Regions owing to the influx of electrical engineers and scientists. Mr. C. D. Taite seconded the vote, and backed up the proposed Manchester electrical exhibition. A smoking concert concluded the proceedings.

Labour and Wages.—A conference took place at Newcastle on Monday between the North-East Coast engineering employers and a deputation from the Amalgamated Society of Engineers, the United Machine Workers' Association, and the Steam-Engine Makers' Association. The subject of discussion at the conference was an application for an advance of 5 per cent. on piece and 2s. per week on time wages. Ultimately the engineers and steam-engine makers agreed to accept a compromise of an advance of 1s. per week on time and 2½ per cent. on piece rates, to take effect from the first full pay in February. An agreement was not come to with the machine workers, the point at issue being whether the advance should apply to men who are receiving under 25s. per week.

Streams of Sweden and Electricity.—The United States Consul at Gothenburg, commenting upon the rapid progress being made in utilising the streams of Sweden having a fall of water sufficient to generate electricity, and the organisation of companies with this object in view, says that the company Sydsvenska Elektriska Aktiebolaget, of Halmstad, is being incorporated and registered for the purpose of buying real estate and waterfalls and erecting plants for the production, distribution, and use of electric power, etc., with a minimum capital stock of about £195,000, and a maximum of about £558,000. A plan to utilise the water power of the River Lagan has been worked out. So far the trouble too often has been to find a profitable use for the electrical energy after it has been produced.

Fire Prevention.—Any improvement in the facilities for dealing with fire in the Metropolis is to be welcomed, and we are therefore glad to learn that the Metropolitan Water Board have decided that the restrictions which have hitherto prevented an extended use of the London Hydraulic Power Company's supply of high-pressure water for fire extinction will be withdrawn. In future it will be possible for anyone to have hydraulic pressure apparatus fitted, subject to the domestic water used being passed through a meter. The injector hydrant combines in one jet the force and volume of both the hydraulic power and domestic supplies. In some districts in London served by the Hydraulic Power Company, under the *régime* of the old water companies injector hydrants have been in use for many years, but in the City and in other important districts it has been hitherto impossible to connect them directly to the water-mains. Such connections are necessary in order to obtain their full efficiency.

London Power Supply.—A conference of the metropolitan borough councils (convened by the London County Council) was held on Monday at the County Hall, Spring-gardens, for the purpose of considering the proposed Electricity Supply Bill of the London County Council. Mr. Evan Spicer presided. The proceedings were conducted in private, and lasted over two hours, but we were informed that the following resolution was agreed to by 14 votes to 6: "That this conference of borough councils approves of the introduction by the London County Council of a Bill enabling it to supply electricity in bulk, subject to the interests of the borough councils' existing undertakings being safeguarded and to the details of the measure proving to be otherwise satisfactory." Those borough councils voting for the resolution were Battersea, Bermondsey, Bethnal Green, Camberwell, Fulham, Greenwich, Hackney, Islington, Lewisham, St. Marylebone, St. Pancras, Shoreditch, Southwark, and Woolwich. The six voting against were Hammersmith, Hampstead, Kensington, Paddington, Wandsworth, and Westminster. With the exception of Poplar and Chelsea, the whole of the 28 councils were represented. We understand that the promoters are satisfied with the result of the conference, and that the terms of the London County Council Bill will be published shortly.

Use of Incandescent Lamps.—The electricity department and the electrical engineer (Mr. R. L. Acland) of the Chesterfield Corporation are to be congratulated upon having prepared an illustrated card giving some practical hints to users of incandescent lamps as to how these can best be used. The instructions may appear simple, but upon their observance really depends the life of a lamp and the economy or waste in current. Users are reminded to regularly clean all their lamps with a damp

Digitized by Google

cloth, holding them by the glass and not by the cap, and when downstairs lamps get dull they should be removed upstairs, and replaced by lamps from above which have not been burning so long. Lamps should not be burned till they are black in the face from old age, as more light is to be obtained from a new 8-c.p. lamp than from a blackened 16-c.p., with only half the expenditure of current. The instruction card does not fail to remind users that current costs more than lamps, and that, although the Corporation sell the light, the price is fixed by the lamps used and how they are used. The advice is given in the form used on a well-known occasion by Mr. "Punch," and householders by bearing in mind the "dont's" are likely to find themselves in pocket. The card is suitable for hanging on a wall, and may be obtained on application to Mr. R. L. Acland, the borough electrical engineer.

The Influence of Electromagnetic Fields on Spark Spectra.—Experiments were made by Mr. John E. Purvis with a view to discovering the influence of very strong electromagnetic fields on the spark spectra of ruthenium, rhodium, and palladium, and the conclusions arrived at are enumerated in the *Proceedings* of the Chemical Society. The instrument used in carrying on the experiments was a 21ft. concave grating spectroscope. The spark passed between electrodes of the metals which were firmly held between the poles of a magnet. The strength of the field between the poles of the magnet was 40,000 units with a current of 21 amperes. The nature of the vibrations was analysed by a calcite prism. The general result of Mr. Purvis's observations showed that: (1) Most of the lines are divided into triplets, and that there is a periodic or rhythmic change in the directions of the vibrations of the constituents of the triplets. (2) Some lines become quadruplets, and within certain definite regions of the spectrum their constituents also change the directions of their vibrations. (3) Other lines become doublets (only a few of the lines are not affected when vibrating in the magnetic field). (4) The inner member of the triplets is usually the strongest, but this is not always the case. The two outer members of a triplet may be stronger than the inner one, and all three are sometimes equally strong. (5) The strongest spectral lines are not the most widely separated when vibrating in the field. Weak lines are usually more widely separated than strong ones. (6) The decrease in the width of the triplets does not proceed *pari passu* from the less refrangible to the more refrangible end of the spectrum.

Platinum.—It is not unlikely that, with Russia's attention being first directed to affairs in the Far East and then towards the pacification of her internal disorders, many of her industries must be adversely affected by reason of neglect and unsettled conditions, and of these the fate of the platinum industry in Russia is viewed with most concern by electricians. Any large diminution in the production of platinum in Russia cannot but accentuate the difficulties arising out of the present inadequate supply, and we must turn our attention to the output returns of other countries to see whether the signs are more promising. The world's total supply of platinum for the year 1904 amounted to about 300 kg., or 9,626 troy ounces, from South America, and 6,000 kg., or 192,500 troy ounces, from Russia. No supply of platinum from Australia was available. A slight product of both platinum and palladium from the Sudbury copper mines was placed upon the market, but it was not found profitable to extract all the platinum and palladium which these ores could furnish. Increased interest in the occurrence of platinum in hydraulic mines and dredges of the Fraser River is due principally to the fact that the natural alloy of iron and nickel previously found in Josephine County, Ore., and in Del Norte County, Cal., has also been found in commercial quantities in the Fraser River at Lillooet. An interesting and new occurrence of platinum in places in Sumatra has been noted by Prof. L. S. Hundeshagen. In a recent report on the production of platinum and allied metals in 1904, Dr. David T. Day, of the United States Geological Survey, points out that the output of platinum in that country had increased from 110oz. in 1903 to 200oz. in 1904, and the increase is interesting as showing the future possibilities.

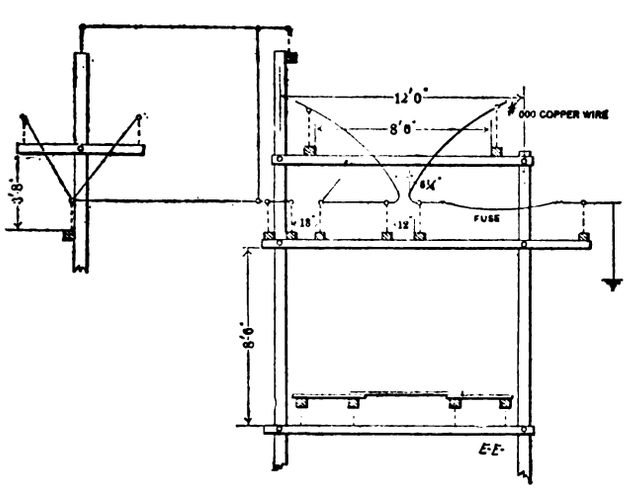
Books Received.—"Die Entwicklungsmöglichkeiten des Induktionsmotors für Einphasen-Wechselstrom," by Dr. R. von Koch (Julius Springer, Berlin. 2s. 8d.). The author of this work has enlarged certain portions of an essay on the possibilities of development of the single-phase induction motor, which he prepared in order to obtain a degree at the Imperial Technical High School, Berlin. He deals first with the Thomson synchronous motor, and, after examining the various motor parts, compares the different types of induction motors. The book, which contains 49 illustrations and diagrams, should prove of service not only to advanced students, but to a much wider area.—The Société Belge d'Electriciens have sent us their *Bulletin* for November, whose articles are concerned chiefly with the exhibits at the recent Liége exposition. It contains an article on the motor invented by Zénobe Gramme in 1869, and announces that in the next issue of the *Bulletin* will appear an account of the movement inaugurated at Liége last month in the memory of Gramme. Descriptions are given of several generating sets displayed at the exhibition, together with an article on "The Telegraphs at Liége Exhibition," by M. J. Pierart.—We have received a copy of the *Proceedings* of the meeting of the Société des Ingénieurs Civils de France held on the 10th inst.—Messrs. Blackie and Sons have sent us "Elementary Physics" (by Mr. J. N. Brown. 2s.), which is intended primarily for students undergoing a third year's school course in physics. The October issue of the *Proceedings* of the American Institute of Electrical Engineers contains a paper on "Some Experiences with Lightning Protective Apparatus" by Mr. J. C. Smith (which we note separately), and a "Note on Lightning Arresters on Italian High-Tension Transmission Lines."—In the *Journal* of the Franklin Institute for November appears, among other articles, a paper dealing with the "Electrolysis of Water" by Mr. J. W. Richards.

Cape Town.—We have been favoured with a copy of the minute of the mayor (Mr. H. Liberman) for the mayoral year ending Sept. 14, 1905, in which is reviewed the work of the Corporation. The Council have had under consideration the question of generating electricity by water from Table Mountain, but it is evident that the possibility of so doing is very remote. It was discussed in the Council as far back as January of this year, and then submitted to electrical and water engineers. The engineers reported that with stations at Woodhead tunnel, Stinkwater gorge, and Molteno reservoir, a total of about 11,830 h.p. could be developed, which could be utilised in 24 or a less number of hours. Anything less than 15 hours, however, would be out of the question, owing to the abnormal capital outlay involved. They also pointed out that a 14-hour scheme would mean a loss of £1,191 to the electrical department, while on a 24-hour scheme, when water is available, a saving of £613 would be effected. But the engineers were unable to recommend the installation of a plant for use during the 24 hours, inasmuch as a constant flow of water could not be guaranteed, and, together with various other difficulties, would necessitate

Digitized by Google

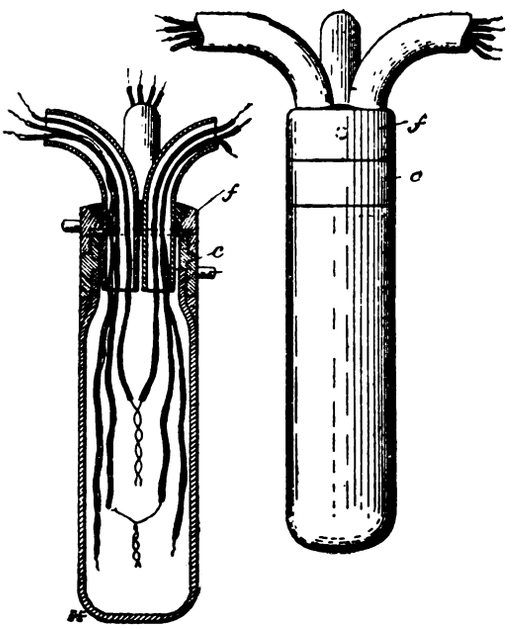
a larger capital outlay, and result in a larger annual expenditure than estimated. Under the circumstances it is not surprising to find the Council shelving the matter. The electric lighting of public streets has been extended in several directions, and the scale of charges for current was reduced to between 1s. and 1s. 6d. per unit for night current, the day units being divided by two, and then charged as night. An increased total consumption of 9·9 per cent. during the year is recorded. The cost of production of current during the first five months of the year shows a decrease as compared with the preceding year, and it is estimated that about £8,800 will be saved under this heading at the end of the year. The Council have shown much activity in dealing with the tramway arrangements, and they have insisted upon the owners of the system, the Metropolitan Tramways Company, Limited, fulfilling their obligations in respect to road maintenance and extensions. The result is that the system is in a good state of upkeep, and should the Council eventually decide to take over its working, they will find in the tramways a valuable asset. On the whole, the volume before us gives ample evidence of the Council's energy and progress.

Lightning Protection.—The October issue of the *Proceedings* of the American Institute of Electrical Engineers (vol. xxv.) contains a paper by Mr. Julian C. Smith, in which is described the apparatus installed by the Shawinigan Water and Power Company for protecting the lines running from their generating station at Shawinigan Falls to the sub-station at Joliette, a distance of 45 miles, and to the terminal station at Montreal, a distance of 85 miles. At each end of the Montreal line was a bank of Westinghouse lightning arresters of low equivalent type, and a bank of static interrupters. The number of gaps in these arresters was decided upon after a series of tests had been made to determine the lowest practicable breakdown voltage. These arresters were set to discharge at about 65,000 volts. In 1904, a bank of General Electric arresters was placed on the 50,000-volt line in the Joliette sub-station. This bank was also adjusted to discharge at about 65,000 volts. In 1904, three banks of horn arresters were installed on the Montreal line. These arresters consist of bent copper rods. The horns are spaced 6·25in. apart at the gap, this distance corresponding to a breakdown voltage of 90,000, and details of the horn lightning arrester may be seen in



the illustration. The company's experience during the past year shows that this scheme works very satisfactorily. In the opinion of Mr. Smith the horns are a valuable addition to the standard equipment, and since their installation there have been no arcs in the station, nor has any damage been caused to the apparatus. No interruption has been caused directly by lightning. On the other hand, each time the horn discharged a more or less severe short-circuit occurred, in no case, however, being severe enough to dislocate the system or to disturb the synchronous apparatus at the stations.

Cable Terminals.—A patent has been granted in the United States for a moisture-proof terminal covering for lead-armoured cables, by means of which, it is claimed, the disadvantages attached to the "wiping" process will be obviated. A description of the invention is given in the *Western Electrician*, and consists of a sleeve of lead or other suitable material forming a case covering for the splices and joints. This covering is completely closed at one end, while the other is "sweated" to a collar of brass (as shown



in the illustration, *e*), provided with a screw thread on its outer extremity to fit the internally screw-threaded lower end of cap, *f*, of brass or other metal. The cap is provided with an internal annular ledge and an extended rim above the ledge, creating, with a lead gasket resting upon the ledge, a shallow cup on the top of the complete casing. The gasket is provided with a series of holes for the reception of any number of lead-armoured cables that it may be desired to use, hot solder being poured around the cables in the shallow cup formed, preferably until the solder rises to a line a little above the top of the cap. By the use of this device it will be seen that to reach the terminal wires to make splices or tests, all that is necessary is to unscrew the brass collar from the cap, when the hollow casing may be removed and the wires exposed.

Railway Signalling.—Experiments have been carried on in America with space telegraphy and the ultra-violet light as applied to railway signalling, which have resulted in the invention of two devices for perfecting the system. One of the serious drawbacks of space telegraphy is the presence of a great number of wires adjacent to the railroad tracks which interfere with the transmission or reception of electric waves unless the aerial be at sufficient height to clear the wires, and to overcome this difficulty Mr. Isidor Kitsee describes in the *Western Electrician* a device which he has recently patented. The apparatus contemplates the use of a pole on the roof of the car, which, like the ordinary trolley pole, may be raised or lowered at will, but which can be operated automatically. In the roadbed are mounted projecting contacts which engage a lever arm at the bottom of the car. This lever arm, upon engaging the contact, is pushed over, and closes an electric circuit on the car which

Digitized by Google

is supplied by a battery. The energisation of this circuit attracts the armature of an electromagnet therein, and releases a spring-driven ratchet wheel, one half of the periphery of which is of conducting material and the other half of a non-conducting material. As the wheel revolves, the tip of the armature glides over the conducting surface, closing a second circuit which includes a small motor driving a drum. The drum winds up the rope and draws down the trolley to clear the obstruction. When the wheel has completed its half revolution and the drum is turned sufficiently to draw down the pole, the projecting arm at the bottom of the car is again moved over by a contact on the other side of the obstruction, momentarily closing the first-mentioned circuit and again raising the armature pawl of the spring-driven wheel. This causes the armature to follow the insulated portion of the wheel, and come to rest in the first insulated notch on the periphery. The motor circuit is thus opened, and a weight on the lower end of the pole draws the latter up to the vertical position. The device is then in the original position, and the circuits are ready to perform the operation again at the next obstruction. Mr. Karl Scholz's experiments with the ultra-violet rays have proved that these rays have the property of reducing the electrical resistance of a spark-gap between two induction-coil electrodes, and the principle has been embodied by him in an ingenious train-signalling apparatus recently patented. Mr. Scholtz's idea is to provide on every train, on the front of the locomotive and the rear of the last coach, a receiving set for utilising the ultra-violet rays. The sender consists of an arc lamp connected to a dynamo on the train. This lamp is provided with a reflector which sends out a beam of light through a rock-crystal lens, which allows the violet rays to pass. The beam of violet light is capable of being projected 300m. or more. The receiving device consists of a spark-gap, which is normally too far open to admit of a discharge, but which, upon being struck by the beam of violet light from another train, will have its resistance reduced sufficiently to allow of a discharge taking place, whereby a relay is operated. The relay closes circuits for operating the air-brakes of the train, and for ringing a signal bell to attract the attention of the engineer. The receiver is fitted with a device for collecting the rays, so that the latter have an effective area of several square feet. At curves an automatic device turns the lamp so that the beam of light is always pointed at a portion of the track the desired distance ahead.

Gas v. Electricity.—Much has recently been heard as to the relative merits of these two forces, both as regards their application to domestic and industrial purposes; and the displacement of electric lamps in some parts of the city of London, together with the installation of gas lamps in Broad-street Station, are urged by partisans of the older rival as indicating its superiority over electricity. Mr. S. M. Hills in a lecture which he delivered to the members of the newly-formed Northampton Institute Engineering Society last Friday night made a comparison between gas and electricity in regard to their use as illuminants, and in the light of recent events some of his conclusions may prove of interest. The ideal illumination, he said, was that obtained by the diffusion of sunlight at the surface of a white cloud, and the nearest approach to this he considers is obtained by distributing a number of lights round a room. Thus, a room illuminated by one 16-c.p. lamp will not be so well lit as if 16 1-c.p. lamps were distributed about it. It is obvious, therefore, that the distribution of light in small elements is much more easily accomplished in the case of electrical illumination than in the case of gas, where an expensive and complicated system of pipes would be requisite. In drawing comparisons between the spectra of the sun, gas, and electric light, Mr. Hills was able to show that the latter possessed greater penetrative power, and was more like that of sunlight than was gas. Hence, in the state of the atmosphere when it is overcharged with water vapour, electricity, especially that supplied to flame arcs, far surpasses any arrangement of gas burners, or even an immense gas torch. A great consideration which weighs in favour of electricity as an illuminant is that there is practically no danger of fire by the use of current, and the speed and safety with which current can be transmitted makes it possible for spots inaccessible to gas to be illuminated. Nearly all electric fittings provide that the light is cast downward without the intervention of anything to bar the passage of a single ray, and the light can be raised or lowered from and to the place where illumination is desired without the danger of fire, inconvenience of heat, or evolution of fumes. In comparing costs, Mr. Hills based his conclusions upon personal observations and upon information supplied by reputable authorities, and arrived at the following figures worked out at city prices for gas and 1½d. per unit for electricity: double burner, ordinary low-pressure gas, 129 c.p., 11·1d., average total cost per candle-power per annum; single burner, high-pressure gas, 150 c.p., 9·0d.; double burner, high-pressure gas, 244 c.p., 11·7d.; old lantern arc lamp, 639 c.p., 8·0d.; flame arc lamp, 5·0d. The electric cost includes maintenance and interest charges, gas cost is solely for gas and mantles. In regard to the use of electricity for heating purposes, the advantages which attend it in its use as illuminant are likewise apparent. Electric heating is yet in its infancy, but further developments will greatly reduce the cost of energy for this purpose. By the use of this apparatus, however, there is a great saving in space, an absence of fumes, and freedom from vitiated air or other waste products. This is an important matter as far as purity of the atmosphere is concerned. As regards vitiating the air of a room with products of combustion, the electric heater is absolutely free from reproach, and the disagreeable effects produced by the use of a gas stove are entirely avoided. There are great possibilities of development in the electric apparatus used for this purpose, and its wider application may be looked forward to.

Newcastle Tram Strike. — Another of those unfortunate disputes between tramway employés and their masters occurred in Newcastle-on-Tyne, when 525 men in the employ of the Corporation tramways ceased work on Saturday last. The case of the dispute was a notice issued by the general manager, Mr. Ernest Hatton, to the effect that owing to the alterations rendered necessary in the winter months, and to the fact that the reliefs for the holidays were complete, the department was overstaffed with traffic employés, and that after Nov. 18 the number of days worked would be 11 per fortnight. This notice was met by the men with a suggestion that more cars should be run with a quicker service, but they gave to the management their notices that they would cease work at midnight on Friday. The Tramways Committee of the Corporation met and resolved that, if the men would withdraw their notices, they were prepared to appoint a sub-committee to meet an equal number of representatives of the men to consider the question in dispute. It was resolved further that, if the men should refuse, a sub-committee, with the general manager, should be empowered to act as they should deem best during the dispute. A mass meeting of the men was held early on

Digitized by Google

Saturday morning, when it was resolved that they should decline to withdraw their notices until the new regulation was withdrawn. The men held another meeting last Sunday night and the following resolution was passed: "That we request the Tramway Sub-Committee to revert to the *status quo ante* and start *de novo*. Provided the committees agree to this, we will resume work on Monday morning, all grievances to be considered by a special committee and the Tramways Committee and an equal number of the tramway employés. All questions remaining unsettled to be submitted to referees." The vice-chairman of the committee (Mr. J. H. Rodgers) and other members of the committee accepted this, and the dispute was settled. It is a remarkable occurrence, though one peculiarly common to municipal management, that, in face of the tramways manager's assertion that his traffic department was overstaffed, the committee should consent to what virtually means a concession to the employés' demand. As is well known, the Newcastle tramway undertaking, whatever other excellent features it may embody, has not been a financial success, and the committee have had to cut down their expenditure in several directions in order to make ends meet. This year, however, it appears that there is a profit of about £20,000, and the employés, instigated by the paid agitator, are already clamouring for a portion. Several of the city councillors, including some of the Tramways Committee, have encouraged the men in their resistance, and it is in a large measure through their instrumentality that one of the agitators was able to exclaim that they had gained a "glorious victory" in which their "conditions were not cut down by one iota." It is needless to point out that such action on the part of sub-committee (if confirmed by the Tramways Committee) in sacrificing their general manager and submitting to the aggressive and uncompromising claims of the men cannot fail to relax the discipline of the service which Mr. Hatton's advent has done so much to restore. A private company would not be afraid to use their powers in so arranging their service as would be compatible with financial success and public convenience, and all the intimidations of salaried agitators would have had no effect in altering their decision to work on other than commercial and economic principles. We are afraid, however, that in the present case sentiment is likely to replace judgment and rectitude, and must suppose that the overburdened ratepayer and companies who pay heavy rates in support of enterprises which directly compete with their own for public favour will derive a morsel of consolation from the fact that the pet panaceas of municipal socialists benefit at least some portion of the community.

Institution of Electrical Engineers (Glasgow Local Section).—The above section of the Institution held its first monthly meeting for this session on the 14th inst. The chairman, Mr. J. M. M Munro, presided, and delivered his inaugural address, his subject being "Electricity in Civic Service." At the outset, the speaker dealt at considerable length with arguments for and against municipal trading. Then, taking Glasgow as typical of a progressive modern city, he described the beginnings, progress, and problems of its various electrical undertakings. He referred to the application of electricity to the city's fire alarms and clocks, and described the developments which had taken place in the apparatus. Going on to speak of the Corporation's two greater electrical undertakings—the lighting and the tramways departments—Mr. Munro traced the rise of these two concerns from their inception up to the present time. The electricity department's output had increased from 408,000 units in 1893 to 44,000,000 in 1905. The tramways department had 700 cars and 150 miles of track. The number of passengers carried for the year ending May, 1905, was nearly 200 millions. The total capital expenditure was abou £2. 15s. per inhabitant of Glasgow. Notwithstanding the triumphs of electric tramway traction, many of its problems still remained for solution. It was still impossible in Glasgow to recover much of the energy spent in stopping for helping to start a car. Mechanical appliances had been devised for this, but good electrical ones were now on the market. Congestion of traffic would compel them to have overhead or underground routes. The annual consumption of coal used for the generation of electricity was in Glasgow 82,623 tons. In 1915 he believed this total would have risen to 200,000 tons. These and other figures given raised several questions of policy primarily applicable to large cities: Ought the production of electricity in bulk for all purposes to be the work of one department distinct from the distributing and tramway departments? Ought such a great coal-burning undertaking to have its works outside the city? Ought great cities to acquire their own coalfields, as they have mostly acquired their mountain lochs and water-gathering areas? With regard to the first question, he would answer negatively in the case of smaller towns, but in larger cities he thought that in these specialising days it was better to put each department under management which could bestow all its attention upon one great branch. Some figures bearing upon this point were then given and discussed in detail. He did not think the removal of the generating stations beyond the city boundary would be in many cases financially advantageous. The profit margins of coalmasters, the cheaper sites, and the cost of carriage of coal and ashes were more than counterbalanced by the interest and depreciation which would be payable on cables, and the 5 to 10 per cent. loss in the long main feeders and the cost of reconversion of all instead of only the greater part of the energy. If transmission of compressed producer gas at high pressure were found to be as economical as electrical transmission of power, they might yet have the gas department responsible for the supply of fuel to the power station when gas-engines were used. Figures relating to the efficiency of gas transmission were quoted, and suggestions made regarding the generating of gas under high pressure. As to the use of water power, the city water supply could only yield 18 theoretical horse-power per foot of effective head. The Falls of Clyde might serve Lanark, but could be of little use to Glasgow. With regard to the utilisation of power from refuse destructors, while it might be wise to use their heat for the generation of electrical energy in small towns, the site and the arrangements of the city power station could only be affected disadvantageously by their modification to the requirements of refuse destruction. Yet the refuse of Glasgow might be capable of yielding over 5,000 b.h.p. for 18 hours per day and six days per week. With regard to street-lighting, much had been said of the displacement of arc lamps in Queen Victoria street, London, in favour of gas. Mr. Munro had found a pocket time-table unreadable 15 yards from the new gas lamp-posts, while at Blackfriars Bridge with flame arc lamps he was able to read the same size of printed matter 100 yards from the electric arc lamp. The displaced arc lamps, however, had been in lanterns of a singularly inefficient and hopelessly antiquated pattern. Some considerations affecting rational policy as regards district power supply and interurban electric traction were then dealt with. On the motion of Dr. Magnus Maclean, seconded by Mr. F. A. Newington, of Edinburgh, it was agreed to ask Mr. Munro's permission to print the address. There was a good attendance, and the session promises to be one of the best which the section has had.

LONDON POWER BILLS.—I.

The Additional Electric Supply Company's (London) Scheme.

Amongst the numerous applications which are being made to Parliament for bulk supply to London, not the least interesting is that of the above company. The engineers for this scheme are Messrs. Kincaid, Waller, Manville, and Dawson, and Messrs. Harper Bros. Through the courtesy of Mr. Phillip Dawson, who is personally responsible for many of the leading ideas in the scheme, we are now able to give the following *résumé* to show in what respect this company's proposals differ from those of most power companies.

In the first place, the Additional Electric Supply Company (London) seek for powers to supply in bulk existing electric light undertakers, tramway undertakers, and railway companies. They do not ask for rights to supply the ordinary power consumer direct. This is a radical difference from the usual power company programme, which should remove the ground of much opposition from existing undertakers. The aim of the company is to supply in bulk to these existing company and municipal undertakers in a way which seems likely to have advantages for both the buyer and seller of the bulk supply. Thus it is suggested that the present undertakers should continue to use their existing plant for meeting peak loads only, and that during other times they should take a steady 24-hour load from the company. Of course this load would not be represented by an absolutely constant demand, but the load factor would be very much higher than is possible when a lighting peak has to be met. The proposed company would also serve railways and tramways, which undertakings are too large and cover too wide areas to be served commercially by existing undertakers. For instance, Mr. Dawson estimates that if the L. B. and S. C. Railway Company were to electrify all their suburban lines they would need about 60 million units per annum. With other railway companies requiring electric energy in amounts of a similar order, it will be seen that the supply of these from one undertaking involves plant of enormous magnitude.

The company propose to erect in the first instance a large power station on the River Ouse, six miles north of St. Neots, or 40 miles from London. In this station turbo-generators with a normal output of 60,000 kw., or 90,000 kw. on overload, will be installed. The actual size of the generators will be determined after powers to carry out the work have been obtained; they will, of course, be as large as can be manufactured with a certainty of successful running. In view of the fact that the General Electric Company of America are now building turbo-generators of 12,000 kw. capacity for the Chicago Edison Company, experience as to the working of such large units will soon be obtainable.

The reason why the neighbourhood of St. Neots was chosen may be summed up as follows: The River Ouse provides ample condensing water. There are numerous coalpits within from 45 to 80 miles radius from which an exceedingly cheap supply of small coal can be drawn. Lastly, but by no means least, the proposed station is close to the Great Northern Railway Company, and this company owns a strip of land adjoining their line along which wayleaves to London can be obtained, and it is proposed to carry a number of overhead wires along this strip of land, which is about one chain wide. The wires will run from the power station up to Enfield, and the voltage will be fixed at something between 20,000 and 30,000 volts. At one or two points along the line this strip of land is not continuous, and at these the company seek powers to acquire compulsorily the land needed to give them a continuous route for their overhead wires through private property. Mr. Dawson assured us that he had examined all the railway lines running out of London, and that the Great Northern Company alone had such a strip of land at their disposal. From Enfield it is proposed to continue the transmission lines underground, using the same voltage, but still railways will be followed where possible. Thus it is proposed by the company to obtain powers for wayleaves over all the railway lines in London, and also along the Regent's Canal and the River Lea Navigation. They only seek powers to break up streets in order to get mains to the works of the present authorised undertakers.

With the plant above mentioned and a 35 per cent. load factor, about 230 million units would be produced each year. The proposed system of supply might lead quite well to a higher power factor than this, and it would certainly lead to extreme economy in production. The power company being relieved from the supply of lighting peak loads could reduce the cross-section of transmission mains for a given output per annum. Again, with the proposed arrangement the present undertakers would use their existing plant for peak load only, and could shut down their stations for at least 16 hours per day even in mid-winter. Under these conditions, therefore, the Additional Electric Supply Company would be able to sell at a rate which should tempt the existing undertakers and attract to them the large private power users. The actual prices to be promised when the Bill comes before Parliament will be disclosed at a later date. The proposed expenditure on the first station and mains is £2,000,000.

INSTITUTION OF ELECTRICAL ENGINEERS.

Inaugural Address.*

BY JOHN GAVEY, C.B., PRESIDENT.

(Concluded from page 700.)

CONSTRUCTION.

No marked changes have taken place in the methods of overhead construction beyond the general tendency towards the wholesale substitution of hard-drawn copper for iron wire for overhead conductors. The magnetic inertia due to the metal itself which affects high-speed results so largely when iron wires are used is, of course, absent in the case of copper. Although the first cost is higher, the scrap value of the copper when renewed is considerable, and there is the further point that when the time arrives for converting overhead telegraph circuits to telephone uses, the appropriated conductors will at once be available. In other respects there have been, of course, various improvements in details, which, however, do not need special mention.

In underground telegraphs, something approaching a revolution is in progress. It is a curious and instructive fact that the majority of the early inventors who designed or imagined methods of telegraphy contemplated the use of underground wires insulated by various ingenious methods, which, however, would scarcely have proved efficacious in practice. Further, in this country two of the great telegraph companies started with the idea of laying telegraphs underground, and very long lengths of guttapercha wire were laid in wooden casing, some of which is re-covered from time to time, and is even now found to be in excellent condition. Various reasons led to the abandonment of underground work in favour of overhead lines, and little was done in later years in the direction of providing a comprehensive underground system until the great work in Germany was initiated in the seventies. Owing, however, to the high cost of guttapercha, and to its great specific inductive capacity, the extended use of this material did not commend itself to the English Government, except, of course, in large towns, where underground work was imperative, for owing to the slow speed attainable on ordinary guttapercha underground wires, and the vast mass of Press matter that had to be transmitted by the Post Office, there was little temptation to indulge in a heavy expenditure with the object of replacing overhead wires by underground work, even though the overhead wires were occasionally subject to serious interruptions which no human skill or engineering foresight could guard against. The introduction of the modern multiple cable insulated by dry paper and enclosed in lead sheath has gone a long way in the direction of overcoming both these difficulties—viz., the financial

* Delivered at the meeting on Nov. 9

Digitized by Google

difficulty of cost and the electrical difficulty of high static capacity.

Incidentally, it may be of interest to refer to the genesis of the modern air-space dry-core cable, for details of which I am indebted to Mr. Kingsbury. It is, of course, well known that many attempts were made years ago to obtain a cheap substitute for guttapercha-insulated wires, and these attempts generally took the direction of wires covered with cotton or other fibrous material enclosed in a pipe or tube, which was filled with a permanent insulator, either solid or liquid, such as paraffin wax or oil. At a later period paper was substituted for cotton, and it was proved that wires so insulated had a lower static capacity than those covered with cotton. It was at first assumed that this was due to the character of the paper used, but it was soon realised that the actual reason was that with the paper the insulating compound could not be forced into the tube so as to absolutely fill all the interstices, and that numerous air spaces existed throughout its length. From this to the use of the present form of cable was but a step. In cables of this type relatively large conductors weighing from 100lb. to 200lb. per mile can be provided with a static capacity of 0·1 microfarad per mile, and where a large number of wires have to be provided, at a total expenditure not very unduly in excess of that necessary for overhead wires. As soon as this type of cable became available for use, the Post Office took the initial step in the construction of a line containing 76 wires enclosed in a 3in. iron pipe from London to Birmingham, a distance of 117 miles. The line was commenced in 1897, was completed in 1899, and brought into use after preliminary experiments had been carried out with a view of determining its adaptability for the purposes of the Post Office. It was, of course, foreseen that the wires in close proximity would be subject to a certain amount of mutual disturbance, and it was doubtful to what extent this disturbance would interfere with the various methods of telegraphy in use. To provide for the worst possible case, therefore, the wires were twisted up in pairs like those required for telephone circuits, and the length of the lay of the neighbouring pairs was varied, so as to provide as far as possible for working metallic loops where necessary, either for telegraph or telephone purposes, with the minimum amount of mutual interference. The experiments proved that it was possible to work duplex on neighbouring single wires of a pair, when earthed at each end, without interference when the speed was limited to that possible with manual transmission. Quadruplex working was subject to some slight interference, but under these conditions Wheatstone working was not possible at a higher speed than 50 to 60 words per minute. The general result, however, was admirable from every point of view, and the steadiness of working and the freedom from interference by atmospheric or other causes was so great that the Portmaster-General subsequently decided to extend the London-Birmingham line to Glasgow. The question of the type of cable to be carried forward then came up for consideration. From London to Birmingham there were 38 pairs of wires. In the interval many types of paper-insulated cables had been devised with a view to obtain a form suitable for use with earthed circuits, and, therefore, to a great extent free from mutual induction, either static or electromagnetic, the ultimate outcome of which was the design of a conductor insulated with paper, each insulated conductor lapped with copper foil, and the whole of the wires cabled and sheathed with lead.

It was finally determined to continue the London-Birmingham section northwards by the laying of a cable containing 37 pairs of the ordinary paper-insulated wires as a core surrounded by 29 copper screened single-wire conductors, this decision being arrived at after it had been proved conclusively that where quadruplex or high-speed circuits were required it was possible to obtain satisfactory working with the quadruplex or Wheatstone on a metallic loop, and to superimpose thereon a key duplex. Where quadruplex is, therefore, in use on a long circuit, six channels are obtained on two wires, or a Wheatstone duplex and a key duplex can be worked on each loop. Again, it has been proved that between London and Glasgow, by the use of a repeater at Preston or Warrington, a speed of 200 words per minute can be obtained on these wires with Wheatstone apparatus, so that it will be observed that a great step has been made by the substitution of a moderately economical system of underground work, susceptible of working at high rates of speed, for the old costly and slow methods which the use of guttapercha involved where land telegraphy was concerned. The main underground line from London to Glasgow will be completed by March or April, 1906, and other important sections of main line, notably a section from London to Chatham, are in hand.

Here, perhaps, I may fitly state that the Post Office and the general public owe a debt of gratitude to our British manufacturers of electrical plant for the energetic and able manner in which they meet all requirements, however onerous, made upon them. They spare neither time, trouble, nor expense in an endeavour to meet the most difficult specifications, and it is not too much to say that without their assistance this record of modern progress could not have been realised. I render this tribute all the more willingly because it has lately become the fashion for irresponsible writers in the public Press to decry the British manufacturer as old-fashioned, not up to date, and not ready to meet modern requirements. I can truthfully say I have nowhere met reputable firms exhibiting this spirit.

Telephones.

Not the least remarkable of the modern developments of electrical engineering is the extraordinary growth of the telephone service throughout the whole of the world. Subsequent to the year 1860, when Reis invented his musical telephone, it was thought by the majority of electricians that no further approach towards the attainment of articulate speech could be made. The possibilities attending the use of loose contacts, at that time the most dreaded enemy of the electrical engineer, had not been foreseen, and the conclusion was generally arrived at that it would be impossible to devise a transmitter free from the defect of causing actual breaks in continuity so as to admit of the delicate curves necessary for the transmission of articulate speech being reproduced electrically. Bell's invention in 1876 was received almost in a spirit of incredulity, and when in the following year it was brought to this country, it was looked upon as a marvellous development. Although as a receiver the instrument was even then practically perfect, its powers as a transmitter were weak, but the invention of the microphonic transmitters in 1877, by Edison in America and Hughes in England, speedily led to the development of the telephone on commercial lines. Kingsbury has told us in his paper read before the Institution in January, 1895, how in 1878 the first telephone exchange was started in London, the old telegraph Umschalter switch having been utilised for the purpose. For many years the service was necessarily imperfect, gauged by modern standards, as for a long period open wires carried overhouse had to be resorted to, and single-wire circuits were practically a matter of necessity at large exchanges, the result being that cross-talk could not be eliminated, and comparatively inefficient transmitters were used in order to reduce the amount of this disturbance. The invention and development of the modern paper-insulated air-space cable, with its low electrostatic capacity, led to the general adoption of the one main factor in satisfactory telephone working—viz., the use of well-insulated metallic circuits so constructed as to be free from cross-talk. This opened the door to the use of the very best types of telephone transmitter, and paved the way for the successive improvements in exchange plant that are so marked a feature in modern systems, and that have led to the extraordinary increase in telephone statistics that has taken place in the last 10 years.

As the result of successive inventions, a steady and rapid improvement in the indoor plant available for exchange work has taken place, and so far as modern telephone switch is concerned, these improvements have been wholly in the direction of reducing the amount of talk on the part of the operator that was necessary under the old conditions. This has been brought about by the provision of a complete system of automatic signalling, whereby she is kept abreast of her work, so that, with the exception of asking for the number of the subscriber who is wanted, there should in all ordinary cases be no need for conversation

Digitized by Google

between the subscriber and the operator, this being accompanied by a corresponding increase in the speed of working. In fact, one system goes so far as to render it unnecessary even to ask for the number of the subscriber required, that information being printed by the caller on a Morse slip. This tendency to reduce the operators to a species of intelligent automaton naturally suggests the possibility of the entire elimination of the operator, and the introduction of suitable automatic apparatus at the exchange. Several very ingenious methods of attaining this end have been devised, and one system has achieved a certain measure of success in America, several exchanges of some magnitude having been equipped with apparatus of this type. Two or three small automatic switches have been installed in Europe, but no European telephone administration has yet faced the problem of establishing an extensive automatic system for the use of towns in which large exchanges are required. To review the reasons for the hesitation so far displayed by the more important of the telephone authorities would be to introduce controversial matter, which would be out of place. The subject is, however, not exhausted, for it is being carefully studied at the present time in America, and there appears to be some possibility of development in the not distant future that may lead to important modifications in present methods.

One word may here be added as to the magnitude of the plant required for modern exchange working. There appears to be an occasional tendency to look upon telegraphs and telephones as a little apart from serious engineering undertakings, because in the actual transmission of telegraphic signals or telephonic speech minute currents measured in milliamperes and microamperes generally suffice. The movement of electric railway trains and street cars or electric cranes, of electric gun-training machinery, and other similar mechanical work, impresses the imagination far more vividly than does the still small voice that is heard in a telephone, but when modern telephone practice is considered it will be found that in the complexity of the system, the amount of electrical energy used for the purpose of signalling, and the extent of the works undertaken, a telephone system regarded from the engineering standpoint is in no degree behind any other electrical enterprise. As an illustration, it may be stated that in carrying out the preliminary arrangements for serving about one-third of the metropolitan area the Post Office has already excavated 564¼ miles of trench, it has laid 1,251 miles of duct, it has provided 162,216 miles of wire, and the weight of copper buried in the London streets amounts to 2,200 tons; and this apart from the work carried out by the National Telephone Company in the same districts. The secondary cells used for signalling and common battery speaking at the Central Exchange have a capacity of 5,500 ampere-hours, and the number of glow lamps in use on the existing Central Exchange for signalling purposes is 25,000. It may be added, however, in illustration of the growth of the system, that the first contracts for the Post Office system in London were entered into on Feb. 24, 1900, and the first exchange was opened on Feb. 24, 1902, with 169 subscribers, the ultimate capacity being 14,000 subscribers. Its growth was so rapid that within two years of its being opened it became necessary to commence the installation of a second exchange which is being constructed within the same building and which will shortly be opened with a further capacity of 20,000 subscribers, a corresponding enlargement of the general appliances in the building being involved.

Perhaps the most remarkable development that has taken place in the whole world is that which in the last few years has arisen in America. In the early portion of my address I referred to certain statistics furnished by the American Bureau of the census. The growth in the number of telephones provided by the American telegraph and telephone companies (commonly known as the Bell Companies) in the United States of America, as shown by the curve on the screen, is absolutely startling. I visited America in 1898, at which date the company had about 400,000 stations open. I have just returned from another visit, and find that they have 1,950,000 stations at work, an increase of 1,450,000 in seven years, and they are still progressing at the same pace. Domestic and other reasons appear to foster the use of the telephone. The number of private houses provided with these modern appliances bears a very high ratio to the number of business premises in which they are installed. All the large hotels have telephones in every room, a central switch connected to the main exchange being located in the hall. Large shops have installations varying from 250 to 1,000 telephones, these in some cases being scattered along the counters so that customers can telephone from their houses direct to the shop assistant whom they know to be acquainted with their wants or fancies.

The most important adjunct to the local exchange system is the trunk line or long-distance service, as it is variously called. In 1896 the Post Office acquired, by purchase, such of the trunk lines as had been erected by the National Telephone Company, and not only did it at once erect such additional wires as were necessary to provide a comprehensive service covering the whole country, but it has been engaged year by year in erecting additional trunks. Such is the favour with which the trunk service generally is regarded, that it is difficult to keep pace with the demand for additional wires. The annual growth is represented by the following figures:

Year ending March 31.	Circuits.	Miles of wire in actual use.
1896	165	17,500
1897	804	47,855
1898	877	55,721
1899	953	63,109
1900	1,039	69,713
1901	1,116	76,831
1902	1,165	83,302
1903	1,309	93,473
1904	1,418	102 799
1905	1,604	112,744

The determination of the distance over which telephonic speech is possible on various types of telephone circuit is a question of the greatest theoretical and practical interest, and it is one that has received much careful consideration. The theoretical investigations of Clerk Maxwell, Kelvin, Oliver Heaviside, G. A. Campbell, Pupin, and others have done much to elucidate the problem under consideration, and we are now, I think, fairly well acquainted with the various factors that govern and limit the range of possible speech, and the methods by which these limits can, under favourable conditions, be extended; such, for example, as the partial neutralisation of the effects of static capacity by the addition of self-induction. In connection with the transmission of telegraphic signals through long cables, it will be borne in mind that Lord Kelvin, in the year 1854, enunciated the K.R. law, and at first attempts were made to apply this law to telephonic work. Now, the simple K.R. law applies with some degree of accuracy to telephonic cables in cases in which wires of approximately the same gauge are concerned, but it fails in cases in which the electrical constants R, K, and L vary materially, and it is quite inapplicable as part of a general law to open lines where self-induction is a marked factor or where the conductivity of the wires varies materially. As illustrating this, the observations made by the able staff of the Bell Companies in America show to what extent the K.R. law fails (see Table A).

It was quite evident that the K.R. law failed owing to no account being taken of the important factor L, and on comparing a large number of results obtained over Post Office lines of different character the following rough empirical formulæ were designed to meet ordinary cases. As will be seen further on, these were found to give fairly concordant results within certain limits.

Aerial lines of 100lb. copper and upwards:

$$M = 210\sqrt{\frac{l}{K.R.\ 1{\cdot}75}}.$$

For unloaded paper cables

$$M = 85\sqrt{\frac{l}{K.R.}}$$

where M = limits in miles.

Before dealing with the more recent formulæ now in use for determining the limiting distances of speech, it may be well, perhaps, to refer briefly to the theoretical conditions

which affect the transmission of telephonic impulse. The ordinary electrical conditions in a circuit which may modify or effect an impulse *in transitu* are the following: (A) resistance; (B) electrostatic capacity; (C) self-induction; (D) insulation; (E) abrupt and numerous alterations in the circuit which may cause reflection; (F) interference from extraneous cause — *i.e.*, static or magnetic induction, leakage, etc.—from neighbouring circuits.

When an electrical impulse is started in a conductor, if the latter had neither resistance, capacity, nor self-induction, and if the insulation were perfect, the wave would move on without attenuation or distortion. The effect of resistance or of uniformly distributed low insulation, however, results in a definite attenuation which increases with the length of the circuit, and, further, the effect of capacity is to cause the wave to spread out, both forwards and backwards, this "talling," as it is termed, not only increasing the attenuation by lowering the amplitude, but causing distortion of the wave itself and also of the neighbouring impulses, with which it interferes. This distortion eliminates the higher notes and harmonics, and in extreme cases causes the voice to lose its characteristic tone, and ultimately to become inarticulate.

Now, it is obvious that it is a matter of extreme importance to ascertain to what extent each of these elements affects in the most material manner the limiting distance of speech, and much light is thrown on this subject by actual experiments made over long lines of various characters—overhead, underground, and submarine. As the result of many trials, it is found that with long circuits free from external disturbance, such as underground wires, the actual practical limit is fixed by the loss of amplitude of the waves—in other words, by the diminution of volume rather than by the loss of articulation—although when these limits are approached it is found that articulation begins to suffer, and when the line is still further increased, the tone becomes low and hoarse, and speech ceases to be practicable. This points to the fact that in actual practical work attenuation due partly to resistance and partly to electrostatic capacity are the dominant factors, and this attenuation when combined with disturbance from neighbouring electrical conductors actually determines the limits of speech. This view is supported by a comparison of the results obtained by calculation and those obtained by actual experiment. That in actual practice articulation is not materially affected up to the point when the volume of sound becomes too small for practical purposes is probably due to the fact that the inherent self-induction of an ordinary circuit suffices to prevent such an amount of distortion as might otherwise interfere with articulation at more moderate distance than those already experienced. Oliver Heaviside, in his "Electrical Papers" (vol. ii., p. 393), showed the extremely limited range of possible speech in paper cables, assuming an entire absence of self-induction in a closely twisted-up pair, and the extent to which this range is extended even by the limited self-induction which obtains in normal conditions. He thus early anticipated the practical results already referred to. At all events, calculations giving the limiting distance of speech on various types of conductors, based on attenuation only, are found to agree with actual experimental facts. The remaining factors, although they must have some influence on the results, can in practice and under conditions which obtain in a simple metallic circuit be neglected.

As a preliminary to the determination of the limits of speech, it is necessary to ascertain the degree of volume and articulation, or, in other words, the audibility, which may be accepted as satisfactory, and, further, to establish standard circuits with well-known constants of R, L, and K to which all lines may be reduced either by calculation, by experiment, or preferably by both. For this purpose, both in America and England, one of the types of ordinary lead-covered paper-insulated cables, in which the above con-

Digitized by Google

stants are measurable, has been selected, and the dimensions of the English standard cable, which agree closely with American figures, are as follows: English — gauge, 20 S.W.G.; weight, 20lb. per mile; diameter, 36 mils; R (loop), 88 ohms; K wire to wire, 0·056 microfard; L, 0·001; insulation, 200. Now, in actual practice a telephone on an exchange circuit must be thoroughly effective whether joined through to another circuit a few yards in length or connected to a long-distance line some hundreds of miles long, but obviously it is quite unreasonable to expect that the conversations shall have the same volume and articulation in both cases, and, of course, when a long-distance line approaches the limits at which it is possible to converse, it is absolutely essential that the apparatus and lines shall be in the best working order, that each speaker shall raise his voice and speak distinctly and close to the transmitter, and that both correspondents shall have their apparatus in fairly silent rooms.

In considering this question from the practical point of view, it is necessary to take into account the variable conditions under which long-distance speech is frequently held. The insulation of long overhead wires may in this climate drop in extreme cases to a figure as low as the metallic resistance of the conductors themselves; slight inductive noises are never really absent, and occasionally they preponderate. In a paper on trunk telephones which I read before the Institution in November, 1896, I pointed out how difficult it was to obtain even an approximately perfect static balance between a telephone circuit and neighbouring wires subject to rapidly varying potentials. Again, the human element largely affects the result; indistinct and muffled speech, disregard of regulations in the use of apparatus, partial deafness, apparatus in noisy and unsuitable localities, all tend to limit long-distance speech, and to render the application of very accurate determinations difficult. In fact, it may be said that the limits of error in calculation, whether the empirical or the more accurate formulæ referred to later are used, are less than the limits of variation in practice, and that, as in all engineering matters, there must be a considerable factor of safety to ensure satisfactory intercommunication. Telephone administrations have carefully considered what are the extreme limits of effective commercial speech under the last-named conditions, and it is generally considered that from 42 to 46 miles of the above-named standard cable is the effective commercial limit, although conversations have been held by experts over 60 miles of such a cable.

This being accepted, two methods can be adopted for determining the limits of speed on various types of telephone circuits. In the first place, the attenuation is calculated for various types of cable, say, by Pupin's formula, in which the insulation, R, is so high that attenuation by leakage can be neglected, or by Campbell's formula for overhead wires when leakage must be assumed. By the use of these formulæ, tables of ratios which express the relative equivalence of each type of circuit to the standard cable are prepared, and the limit of commercial speech having been fixed in miles of standard cable, the limit on all other types of conductors is a simple matter of calculation. The second method, of course, consists in a direct comparison of all existing types of line with a standard cable. A lengthy series of experiments has been made on all classes of Post Office conductors—overhead, underground, and submarine—and they have been balanced by means of a standard apparatus to their equivalent lengths of actual standard paper cable. The equivalent lengths have also been calculated by Pupin's and Campbell's formulæ, and Table B shows the degree of concordance in the results, as also corresponding figures based on calculations made by means of the empirical formulæ already referred to. It will be observed that the calculated limits of speech based on attenuation agree absolutely with experimental results on all the underground cables. There are, however, variations in the calculated and observed results obtained on overhead lines, and these are no doubt due to variations in insulation and to slight disturbances which affect the audibility materially when approaching the limits.

Another method of investigating the problem of telephonic transmission has been undertaken at the Post Office, and although the experiments are not complete, I propose to attempt to show some of the results which exhibit graphically the attenuation which in practice takes place under varying conditions. Two circuits have been selected, one consisting of a mile of the standard cable already referred to, and the second consisting of 20 miles of similar cable. A Duddell's oscillograph has been used for observing simultaneously the curves due to the action of the induction coil at the transmitting end and the corresponding curves at the receiving end of the circuits. A number of letters, both vowels and consonants, have been rapidly spoken into the transmitter, and the respective transmitted and received curves for each have been recorded in the usual photographic manner. The results are not, I fear, quite so distinct as I could wish, but there are considerable difficulties in manipulation, which, perhaps, may be overcome later. One, for instance, is due to the great difference in amplitude of the curves at opposite ends of the long length of cable. The spot of light in the transmitting end travels over a longer range than at the received end, and the photographic exposures, therefore, vary in the inverse ratio of the amplitudes. However, I hope enough will be seen to make this line of investigation clear, and to prove to some extent the accuracy of the foregoing data. It will be seen that on the one-mile length the curves at opposite ends are almost counterparts one of the other, the difference of amplitude being inappreciable, and all the irregularities of each transmitted curve being faithfully reproduced at the distant end. Where, however, the longer length of cable is introduced, the difference of amplitude is most marked, and although it is perhaps somewhat more difficult to compare the shapes of the two curves, they still bear a substantial resemblance one to the other. I hope that when some of these curves have been carefully traced it will be possible to reproduce them in the *Transactions* in a more distinct form than is possible under present conditions. It will, no doubt, be observed that this method of reproducing the curves due to specific sounds affords a great improvement on the old phonautographic method. In the latter the sharp peaks on each curve which may be observed on the best of the slides just shown are all rounded off in most of the published illustrations, and no other result can be expected where levers are used to increase amplitude. The oscillographic method of producing these curves should be of considerable use in the study of vowel and other elementary sounds.

It is, of course, obvious that any marked improvement in the normal types of telephone apparatus will tend to extend the ranges given in the tables. Further, it will be observed that these ranges are based on a 43-mile limit of standard cable, although under favourable conditions, and with expert users of the telephone, much longer distances are practicable. These limits also presuppose that the telephone is joined directly on to the line, and they have to be cut down when the exchange apparatus and the subscriber's line are added, by an amount equal to their equivalent mileage Such tables as these admit of a determination of the gauge and type of conductor necessary to serve any given locality, it being borne in mind first that in a country like Great Britain, where main trunk lines pass through towns of considerable size every few miles apart, it is difficult to carry heavy-gauge wires intact from one extremity to the other—*i.e.*, lighter gauge open wires and underground work have to be introduced in sections to overcome obstacles, and, further, that telephonic communication differs from telegraphic in so far as this, that where the former is concerned any given town may require to be put through to any other town within the general telephonic range of the service. It is, therefore, obvious that in laying-out and adding to a system of telephone trunk communication, the extended use, either of small-gauge conductors or of underground work generally, is absolutely inadmissible. Such conductors with limited range can only be used under well-defined conditions. It follows that to provide an efficient and economical service it is necessary to make a careful study of the country as a whole and to lay out the trunk lines in such a manner as to deal with the maximum traffic with the minimum weight of copper, and to provide for general intercommunication by the shortest possible lengths of trunk circuit. It will,

Digitized by Google

of course, be borne in mind that the foregoing remarks apply to unloaded circuits—*i.e.*, those not fitted with artificial inductances. Incidentally, the following curves may be of some interest. They represent measurements made with a sechometer on various types of loop, and they illustrate very graphically the fact that on short lengths the self-induction predominates largely over the capacity. As the length of circuit increases the curve first rises, but as the capacity effects increase more rapidly than the inductances, the curve reverses and falls until a point is reached in which the self-induction and the capacity neutralise one another.

I have already referred to the question of increasing the self-induction of telephone lines by the addition of induction coils at definite lengths. In America the question has been dealt with by Dr. Pupin, and considerable work has been done in that country in the direction of loading underground cables, as it is termed. The Post Office took up the subject at an early date in connection with its main underground lines, and a marked measure of success has already been obtained. In one case that may be taken as an illustration a cable containing 56/100lb. conductors, was loaded by the insertion of coils at intervals of a mile; the original factors were R = 17 ohms, K = 0·053 microfarads, L = 1·4 millihenries, and the total added inductance per mile amounted to 40 millihenries, the original R being raised to 21·34 ohms per mile by the addition of the coils. The equivalent range of speech was, however, increased from 66 to 176 miles. In the Post Office experiments on its long-distance lines so far, the use of iron in any portion of the coils has been found to be deleterious as compared with coils without iron cores. True, the volume of sound was always materially raised where iron was used, but at the cost of articulation, whilst a judicious addition of self-induction without iron always improved both the volume and the articulation. Very satisfactory results have, however, been obtained in America and in Germany by the use of ring-coils with extremely fine iron cores, and further progress in this direction may be anticipated. On this subject a valuable paper was read by Dr. Hayes at the recent congress in St. Louis, in which he shows how under suitable conditions the attenuation in long lines is materially diminished by the addition of suitable inductances properly spaced. His paper is a valuable contribution to our knowledge of the subject. Experiments with overhead conductors have not proved so satisfactory as with underground cables. The variation in the insulation of the open wires upsets the balancing due to the coils, and lightning troubles have affected the coils. For the present, at all events, this method of increasing the range of open conductors of limited gauge cannot be considered so satisfactory as the corresponding results with underground work, and opinions as to the future of open wire loading appear to be somewhat divergent.

Unsolved Problems.

Finally, there are the unsolved problems in connection with electrical methods of communication to consider. These are neither few nor unimportant. Dealing with the different heads of my address in order, the telegraphic problem is by no means finally solved, notwithstanding the years which have elapsed and the growth of the system since its introduction. A means whereby telegraphic messages can be received at high rates of speed in type or written character ready for immediate issue to the public or the press appears to be one of the desiderata of the future. That this need is fully realised is shown by the ingenious inventions that have from time to time been received and experimented with by the most important of the telegraphic administrations in Europe and America. Incidentally, I think I may truly say that one of the most painful duties imposed on the heads of a telegraph service is the rejection of inventions on which an untold amount of skill and labour have been expended, but which for one reason or another are not fully adapted for practical requirements. I have reason to hope, however, that we are now within a measurable distance of a satisfactory solution of one branch of the problem just referred to.

Next, in wireless telegraphy, there is the difficult problem of perfect tuning which will obviate all mutual disturbances between different wave-lengths, and, in addition, it can, I think, scarcely be said that we have arrived either at finality in the matter of wireless receivers. In fact, the impression left on one's mind after a study of all the methods so far evolved is that we are even now far from having a thoroughly effective or reliable receiving arrangement, if we compare the reliability of wireless with that of telegraphic or telephonic communication. Then in telephony there are at least two fundamental problems which await solution: first, the invention of an effective telephone relay or repeater; and, secondly, a method of extending the range of communication in submarine cables. In reference to the existing practical limits of speech on circuits of different types, it will be evident that these limits are such that it is not always possible to meet the requirements of the public over Continental areas of great extent, or in cases where long submarine cables are necessary. Until recently all attempts to design a satisfactory telephone relay had failed, but the American Telegraph and Telephone Company have now under trial an instrument termed an Exalter, which, when placed in a suitable position on a long line, materially improves the communication. I tried this recently between New York and Chicago, and I hope shortly to have an opportunity of experimenting with it on our long-distance lines and cable circuits. It is the first step that costs, and we may now look forward hopefully to other developments.

Notwithstanding the very great advances made in the modern switchboard, the problem of affording intercommunication between very large numbers of subscribers is by no means finally solved. The largest multiple that can be fitted in practice on one board does not exceed 20,000 lines, and not only in London, but in several American towns, provision is being made in one building for numbers varying from 40,000 to 60,000 telephones, two or three separate exchanges being provided in one building. That this duplication and triplication of exchanges is the final solution of the problem no one would, I think, venture to predict, and, as I have already hinted, there are indications that the difficulty may be met in another manner. The submarine cable problem for telephonic use is not an easy one, as guttapercha, which, so far as our present experience goes, must be used in some form, has such a relatively high electrostatic capacity that it has not been found practicable to use it for really long cables, and the problem of loading, which at first sight would appear to offer a solution of the difficulty, has not yet been met in a satisfactory manner. Again, although much has been done in the direction of improving the methods of telephone switching—and only those can judge what progress has been made who are familiar with, for example, the modern central battery board, and can compare its working with that of the older forms—still we are by no means near finality, and there are possible improvements and modifications looming in the not distant future which may profoundly modify our present practice.

Finally, I have little doubt that the progress of electrical means of intercommunication will in the future go on unchecked, and that those associated with and responsible for such progress will in the course of the next few years bring about such developments that they will be in a position to compare in no unfavourable manner the advance of these particular branches of our work with that which we can foresee in all other branches.

SOME OBSERVATIONS RESPECTING THE RELATION OF STABILITY TO ELECTRO-CHEMICAL EFFICIENCY IN HYPOCHLORITE PRODUCTION.*

BY W. POLLARD DIGBY, A.M.I.E.E.

Any person referring to Herr Viktor Engelhardt's encyclopædic monograph on hypochlorite production, and examining in detail any of the tables or curves, cannot but be struck by the fall in the yield of available chlorine per kilowatt-hour as the amount of available chlorine in the solution increases. Diagram No. 1 is a reproduction of a typical instance. Curve A represents the falling

* Paper read before the Faraday Society, Oct. 31.

Digitized by Google

current efficiency in percentages of the theoretic yield; Curve B represents the energy efficiency in kilowatt-hours per kilogramme of available chlorine; while Curve C represents the salt consumption in kilogrammes of sodium chloride per kilogramme of available chlorine. To these curves the writer has added the curve marked D, which, for the given solution, shows the percentage between the chlorine present in the solution as sodium chloride, and the smaller quantity which has been converted into available chlorine in the form of sodium hypochlorite. This curve depicts an obviously unsatisfactory state of affairs, when one considers that at the finish of the run only 17·48 per cent. of the chlorine initially present has been converted into hypochlorite.

Examinations of other tables show that the fall in current efficiency for the same apparatus, with the same specific gravity of solution, varies with the difference of potential between anode and cathode, or, in other words, with the distance between the electrodes if these remain constant in area. A particular example occurs on p. 136 of Engelhardt's book, where in Fig. 147, with a 24·5 per cent. sodium chloride solution, the current efficiency falls to 50 per cent., when the available chlorine present has reached 9 grm. per litre, the voltage being 4·0. By increasing the voltage to 5·5 the current efficiency does not fall below 50 per cent. until the available chlorine amounts to

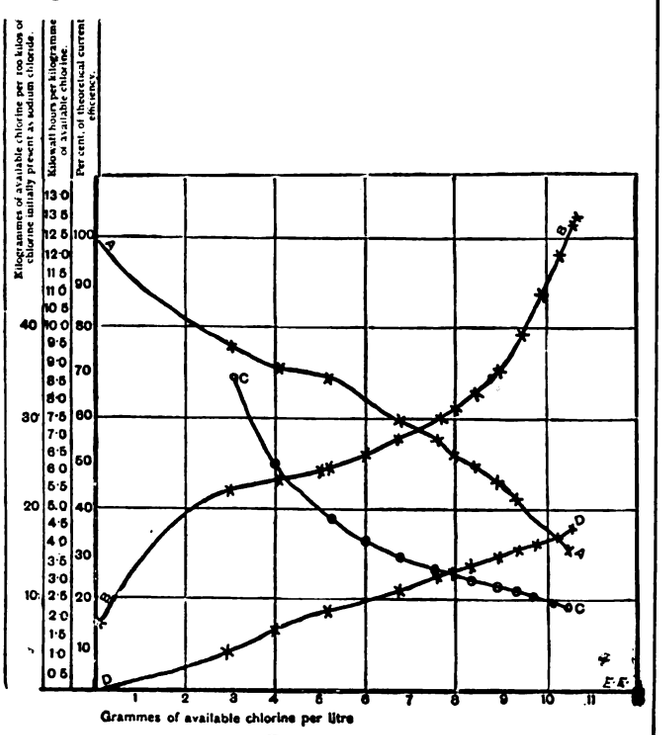

DIAGRAM 1.

15·2 grm. per litre. Raising the voltage still further to 6·5, the current efficiency remains above 50 per cent. until a strength of 17 grm. per litre is reached.

One hypothesis to account for this state of affairs would be that, other factors being constant, the amount of available chlorine produced from a sodium chloride solution depends upon the amount of unconverted sodium chloride actually present between the electrodes. In support of this view, the succeeding diagram in Herr Engelhardt's book may be referred to. In this is shown the effect of keeping the voltage constant at 5·5 volts, and increasing the amount of salt in the solution. The following figures are abstracted from that diagram.

Percentage NaCl in solution.	Strength attained in grammes of available chlorine per litre before current efficiencies fall to 50 per cent.	Percentage of chlorine in solution as sodium chloride converted into hypochlorite.
6·0	2·9	7·9
10·0	8·2	13·6
17·0	11·5	11·1
24·5	15·3	10·4

A comparison of the first and second columns shows that by regarding 50 per cent. as the critical point in the fall of the current efficiency, the maximum strength in available chlorine which can be attained before this point is reached increases with an increase in the density. The third column shows that a further explanation of the falling efficiency is necessary, as in the four cases cited the percentage of the salt converted into hypochlorite is by no means constant. A partial explanation may be afforded by a study of the stability of the solution, and in a consideration of the ratio of the volume of the electrolyte to the amount of electrical energy required per hour.

The factors which go to produce a really stable solution of sodium hypochlorite, such as a solution which, kept in a dark amber-coloured glass-stoppered bottle, will only lose 5 per cent. of its strength per annum, or which, when standing in an open tank exposed to the air, will only lose one-half of 1 per cent. of its strength in 28 days, are numerous. Of these, temperature during manufacture is of supreme importance. The writer has also found it generally advisable to sacrifice a large part of a possible high electrochemical efficiency, and work with lower efficiencies when desiring to produce stable solutions. In cases, however, where the solution produced can be supplied almost immediately, as in the sterilisation of sewage effluents, or in the

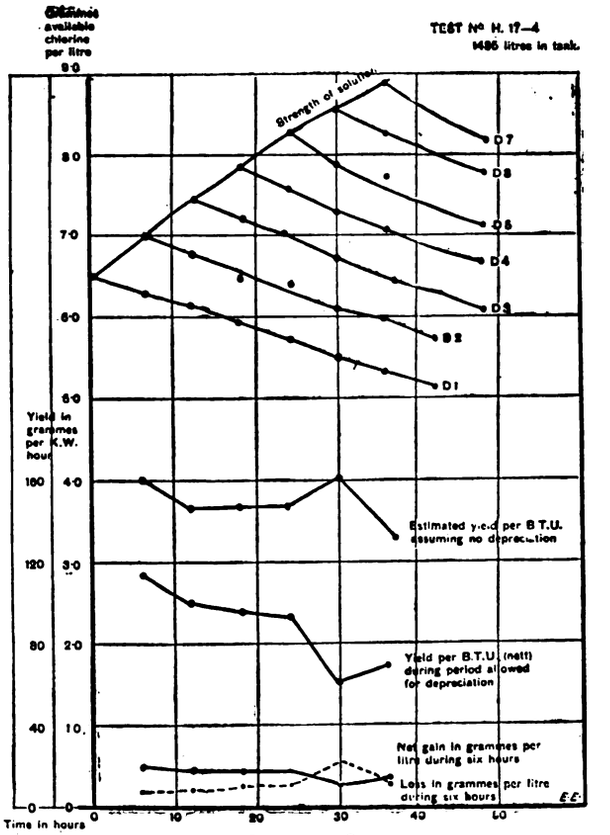

DIAGRAM 2.

bleaching of the materials used in papermaking, a small percentage of instability is practically immaterial so long as the ratio of storage capacity to the dynamo output remains small, say five times the hourly quantity of solution produced. If, as in a case recently investigated, the storage capacity represented from 50 to 70 times the average output, a depreciation in itself relatively small, absolutely prevents the commercial production of solutions containing 7 or 8 grammes of available chlorine per litre.

Attention was called to this matter by the fact that on one run with 2,250 litres of saline solution of a specific gravity of 1·086, it took four hours to increase the strength from 7·847 grm. of free chlorine per litre to 7·867 grm., during which time 4·688 kilowatt-hours were supplied to the electrodes in the tank. This amounted to a net increase of 45 grm., or less than 10 grm. of free chlorine per Board of Trade unit. A sample taken at the commencement of the four hours was found to have lost ·337 grm. per litre in four hours. Nearly the whole of the electrical energy supplied was, therefore, required to balance this total loss, 758·25 grm. in the tank. The real electrical efficiency (assuming that no depreciation had taken place) would thus have been in the neighbourhood of 171 grm. per kilowatt-hour. Subsequent analysis showed this

Digitized by Google

abnormal rate of depreciation (of nearly 1 per cent. per hour) to be due to the presence of certain metallic impurities in the electrolyte, and special precautions were taken to reduce the amount of these in the succeeding trials of this type of electrolyser. If, however, the ratio of storage to hourly output had been within the limits suggested by the writer, this depreciation would not have proved an insuperable bar to the obtaining of a 10-grm. or 15-grm. solution on a commercial scale.

For working under the conditions ruling when the writer was conducting his tests, it became necessary to take special precautions to remove such impurities from the electrolyte. These precautions were fairly effective, but did not by any means eliminate the deterrent effect of the depreciation on the economic production of solutions containing from seven to ten grammes of available chlorine per litre. The following table gives the observations taken during six-hour intervals on test No. H. 17-4. Certain of the results are depicted on diagram No. 2. The upper part of the diagram shows the gradual increase in the amount of available chlorine present per litre, and the curves set off from this, D 1, D 2, etc., the strength at succeeding six-hour intervals of samples taken. These were placed in bottles, which were suspended in the electrolysing tank in order that they might be subject to the same conditions of temperature, etc, as the main volume of the electrolyte. It may be mentioned that the temperature of the electrolyte remained constant at 13·5deg. C., while the temperature of the surrounding atmosphere varied from 17deg. to 20deg. C.

TEST No. H. 17-4. 1,485 Litres in Tank.

Power supplied in B.T.U. during period.	Grammes of available chlorine per litre present in solution		Net grammes of available chlorine produced, *i.e.*, gained during period.		Grammes of available chlorine lost, *vide* depreciation best in period.		Estimated production assuming no depreciation.		Time between Tests.
	At start of period.	At end of period.	Total quantity. Grammes.	Net gain per kilowatt hour. Grammes.	Grammes per litre.	Total grammes in tank.	Total grammes per litre.	Yield in grammes per kilowatt hour.	
6·48	6·5	7·0	742·5	114·6	0·20	297·0	0·70	160·4	6 hours
6·48	7·0	7·44	653·4	100·8	0·20	297·0	0·64	146·6	6 hours
6·54	7·44	7·86	623·7	95·3	0·23	341·5	0·67	147·5	6 hours
6·54	7·86	8·27	608·8	93·0	0·26	386·1	0·67	147·5	6 hours
6.60	8·27	8·54	400·9	60·7	0·45	668·2	0·72	162·0	6 hours
6·60	8·54	8·85	460·3	69·8	0·28	415·8	0·59	137·7	6 hours

The next table, together with diagram No. 3, gives details of another run in which a larger volume of electrolyte was used, amounting to 2,038·5 litres. In this case the figures are given from the start of the run instead of for the end portion, as shown in Diagram 2. The depreciation tests were taken at 12-hour intervals. Owing to the precautions mentioned, the electrolyte contained fewer impurities, and the solution generally was more stable; owing, however, to the greater volume of the electrolyte, the net gain per kilowatt-hour was in the latter stages greatly inferior.

TEST No. H. 21-4. 2,038·5 Litres in Tanks.

11·96	5·20	6·14	1,915	160·0	0·10	203·8	1·04	177·1	12 hours.
12·50	6·14	6·91	1,854	148·3	0·21	428·0	0·98	160·5	12 hours.
12·48	6·91	7·59	1,386	111·0	0·20	408	0·88	143·7	12 hours.
12·48	7·59	8·08	908	80·0	0·40	816	0·89	145·3	12 hours.
12·40	8·08	8·54	938	76·0	0·33	672	0·79	129·8	12 hours.

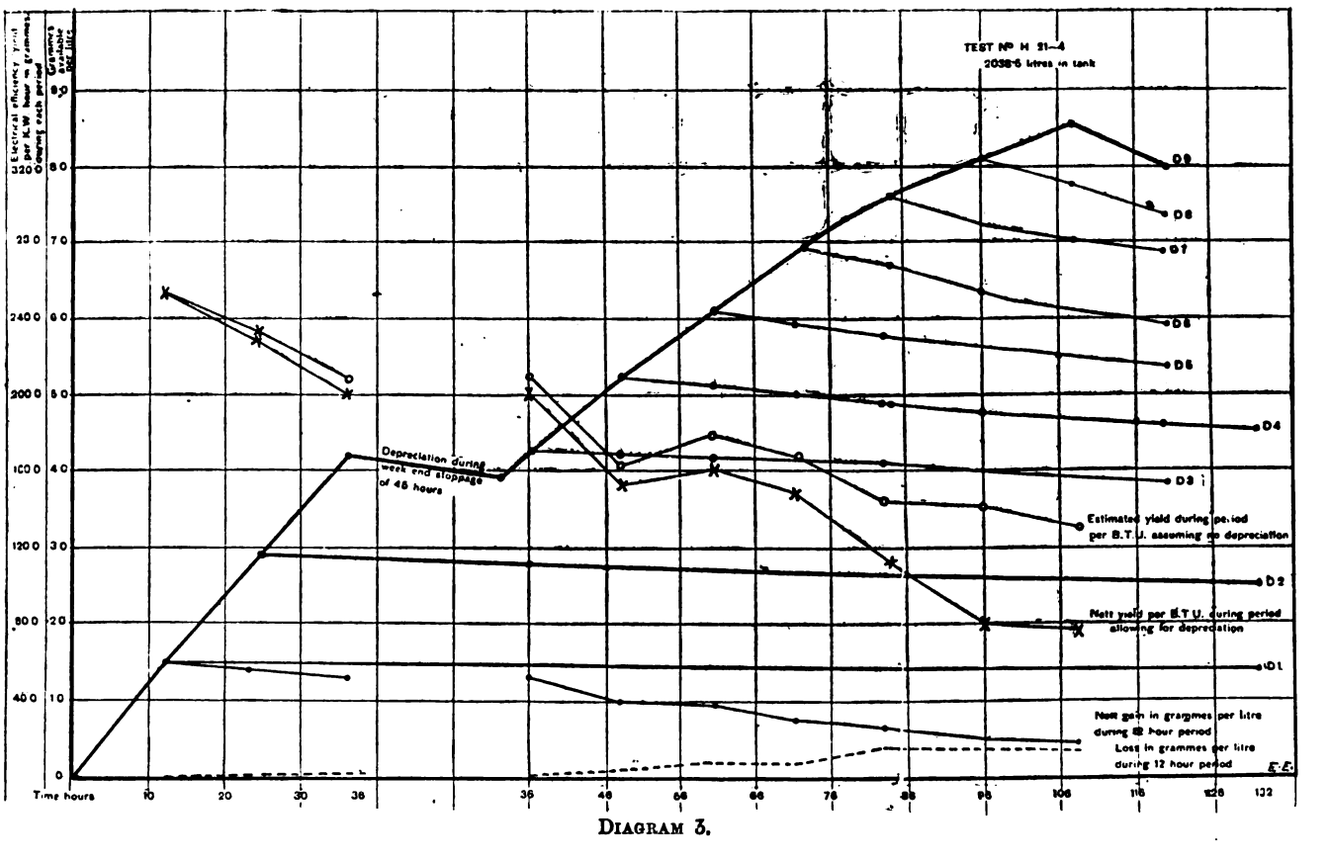

DIAGRAM 3.

Owing to the precautions mentioned, the electrolyte contained fewer impurities, and the solution generally was more stable; owing, however, to the greater volume of the electrolyte, the net gain per kilowatt-hour was in the latter stages greatly inferior.

In diagram No. 3, which illustrates the above table, a break occurs at the thirty-sixth hour, owing to the stoppage at the week-end. As stated, the samples set aside for measuring the depreciation were examined at 12-hour intervals, the Curves D 1, D 2, etc., indicating the loss in available chlorine of these. The effect of loss of strength of the electrolyte in the tank is appreciable when the strength of the solution has arisen to 4·18 grm. per litre. The margin between the actual efficiency and the estimated efficiency had the electrolyte remained unchanged in regard to its available chlorine contents is then about 4 per cent. The effect of the loss of strength, when the solution contains 8 grm. of available chlorine to the litre, adversely influences the yield per kilowatt-hour by over 60 per cent. as against the yield had the electrolyte remained stable, and no loss

Digitized by Google

through depreciation needed to be made good. In this case the tank temperatures varied from 13deg. to 16·5deg. C., and the temperatures in the room from 19·5deg. to 23·5deg. C.

From his experience on these trials the writer is of the opinion that no test of the efficiency of any apparatus for the electrolytic productions of the hypochlorites can be regarded as complete without an estimation of the losses through instability, and a mention of the volume of the contents of the electrolysing tank. While stability of solution does not greatly affect the efficiency from any continuous type of apparatus (in which the sodium chloride solution is fed in at one end, and drawn off at the other end ready for use), it will materially affect the efficiency in any non-continuous apparatus such as that tested by the writer, or in any of the cases in which the electrolyte is circulated through an external cooling tank and returned to the electrolyser to be further worked up. The relation between the amount of chlorine present as sodium chloride and the amount of chlorine in the form of hypochlorite is unsatisfactory in most of the cases which have been chronicled by various investigators. Instability is one cause of this. But even allowing for this, the fall in efficiency is in no way proportional to the decrease in the amount of unconverted sodium chloride present in the solution. The factors which produce a markedly unstable solution are numerous, and further investigation is necessary. When the writer first considered the question of the relation of stability to efficiency, he thought it would have been possible to have plotted a curve indicating once and for all the probable amount of depreciation per hour for different strengths of available chlorine per litre. He has found that even with a cool electrolyte, a difference of one part of iron in 100,000 parts of water in the solution affects the depreciation curve to a marked degree. During the experiments to which reference has been made it was found impossible to keep the percentage of iron present at an even figure, and on this account no figures are given in these pages. It can only be said that during the run depicted on Fig. 3 the presence of iron was much less marked than in the run depicted in Fig. 2.

In conclusion, the writer desires to express his indebtedness to Mr. F. Ernest Pollard for valuable assistance rendered during the tests, in particular for localising certain ferric chlorides as one of the disturbing factors, which limited the economic production of solutions containing from 8 grm. and upwards per litre of available chlorine.

THE APPLICATIONS OF ELECTRICITY IN THE ROYAL GUN FACTORY, WOOLWICH ARSENAL.*

BY COLONEL H. C. L. HOLDEN, R A., F R S., MEMBER OF COUNCIL.

When it was suggested to me that I should put before the Institution, in the form of a paper, a description of what had been done in the matter of electric driving in the Royal Gun Factory, with which I have been associated since 1899, I felt some diffidence in complying with the request, because it did not appear that a mere description of what had been done in this direction would possess sufficient interest unless there was some notable departure from ordinary practice, since the electric driving of factories is now fast becoming the rule instead of the exception. As far as I am aware, some of the methods I shall describe and illustrate to you are departures from the ordinary methods in vogue, and on that account I am in hopes they may be of interest, and this must be my excuse for bringing them to your notice. I do not, however, intend to confine myself entirely to methods of electrical driving, but will describe more or less briefly other applications of electricity which have been found to be of use in this particular factory.

The question of the relative merits of individual motors for driving machine tools *versus* motors driving groups of tools has often been discussed, but no hard-and-fast line can be laid down as to when either system should be used, except, perhaps, for tools which require a large amount of power, certainly not less than 10 h.p. or 15 h.p. as a minimum; but the converse of this is not true, because it may often be expedient to employ a motor of even a fraction of a horse-power for an individual machine. It comes to this, therefore, that each individual case must be considered on its own merits, and this is the principle on which I have worked. In the case of a great many conversions of workshops to electric driving, all that has been done has been to substitute an electromotor for the prime mover previously used, be it steam, gas, or other engine, and though this may have effected an improvement in economy and other ways, it is not by any means as good as if the

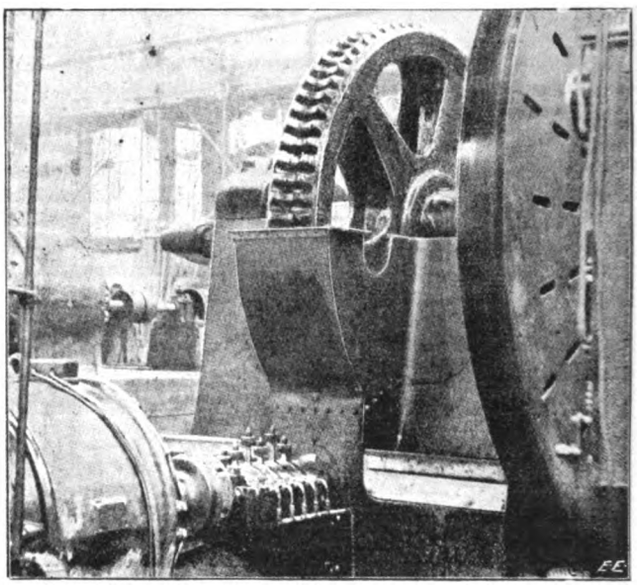

FIG. 1.

whole system had been remodelled with a view to electric driving throughout. I may here explain, for the benefit of the few of those present who do not already know it, that the work of the Royal Gun Factory consists of the manufacture of guns ranging from 3cwt. up to 60 tons, or even more, and also in the manufacture of the breech mechanisms or other adjuncts and appurtenances of the guns themselves. This work necessitates a very large range of machine tools, from boring machines 50 yards in length and lathes of 100ft. bed, down to the smallest milling machines and lathes. There is therefore plenty of

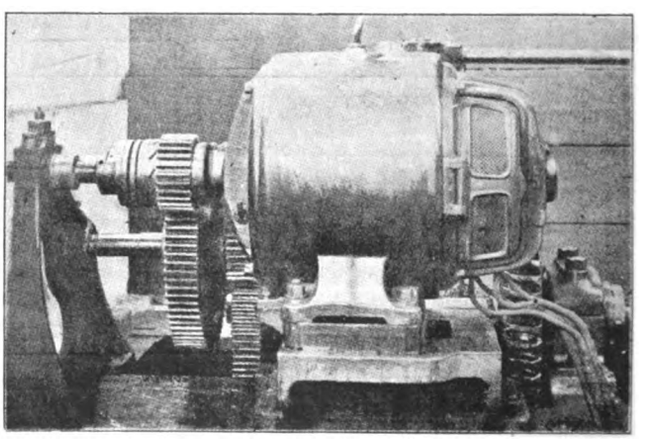

FIG. 2.

scope and opportunity for the employment of different descriptions of electrical drives. Although there were previously several instances where in the factory electromotors had been substituted for steam-engines, it was only in 1900 that I converted the first of two large boring machines to a direct electric drive by means of a variable-speed Schuckert four-pole motor of 25 b.h.p. (Fig. 1). The variation of speed was obtained by the now well-known method of varying the excitation of the fields, and the ratio in this case was 1 to 3·5 or so, giving speeds of from 250 r.p.m. to 880 r.p.m., which is amply sufficient range, without any further gear, for the work that is put into these machines.

* Paper read before the Institution of Electrical Engineers.

Digitized by Google

The machines themselves are of the simplest possible description. The headstock which revolves the work carries between its bearings a large worm-wheel (Fig. 1), which is driven by a worm-shaft forming a continuation of that of the motor, but connected to it by a flexible coupling; the thrust of the worm-shaft, which in such large machines is very considerable, amounting to tons in some cases, is taken by a thrust bearing of marine type, and through this the cutting lubricant passes on its way to the boring bar; this is only a precautionary measure, but, nevertheless, a necessary one, as not only is it very important that the machines should not stop during a boring operation, but also, as they have to run from early on Monday morning till late on the Saturday night, and are only stopped for shifting or adjusting the work or tools, it is imperative that any trouble that could arise from a heated bearing should be guarded against; and I am happy to say that so far there has not been a single machine stopped from this cause. They run absolutely silently and without jar or vibration; indeed, in this respect the worm and worm-wheel, together with the electromotor drive, is ideal; and even if it have the defect that it is slightly less economical than spur gear, this loss is more than compensated for by the extra accuracy of the work done and the freedom from breakage of tools. It would be impossible in a spur-gear driven machine, I believe, to fine bore a hole 12in. to 20in. in diameter and up to 50ft. in length without a variation of 0·004in. in diameter, which is what these boring machines are called upon to do, and do to perfection, daily.

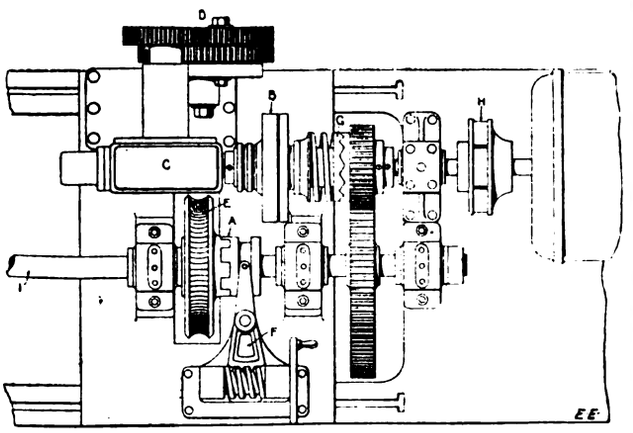

FIG. 3.

The feed of the boring bar in the machines described is worked from the motor by means of a shaft, which connects it with change gear, similar to that of a lathe, at the other end of the bed, 150ft. away. At this end there is also a 15-h.p. series motor, which can be mechanically coupled to the screw shaft moving the boring head and saddle, with the object of withdrawing or advancing one or both rapidly in either direction as required; in this case I have introduced a slip coupling (Fig. 2), which in the event of an overload not only slips, but also draws attention to the fact by making a hideous noise; this is, I think, better in many ways than the overload release, and much more convenient, of course, than a fuse which has to be replaced. It may be interesting to you to know that the change to motor driving, and the improved control of the speed, enabled us to turn out at once more than double the former amount of work done per week. It was considered necessary at first to put the control of the speed in the hands of the foreman only, and for him to lock up the shunt regulator; this is now found to be an unnecessary precaution.

A later development of this method of driving is one whereby the driving shaft, just mentioned as running the whole length of the bed, is entirely done away with, and the one motor, now a variable-speed shunt motor, does all the feeding of the boring bar, as well as the rapid advancement and withdrawal of it and the saddle, the latter weighing 10 to 12 tons or more. How this is effected is shown in the diagram of this feed gear in Fig. 3. The action of the gear is as follows: The motor drives the shaft through a flexible coupling, H. This shaft carries on it the magnetic clutch, B, and beyond the clutch the worm, C. It also carrier on a sleeve a pinion, and the overload clutch, G, and an armature. The worm gears into the worm-wheel above it, from which the change gear, D, similar to that of a screw-cutting lathe, and situate behind the worm-wheel, drives a horizontal shaft on which another worm engages with a second worm-wheel, E. This latter can be clutched mechanically by the claw clutch, A, to the screw shaft, I, actuating the saddle, The claw clutch, A, is moved by a handwheel in and out of position, and the lever, F, that moves carries a contact which only allows of the magnetic clutch, B, being in action when the claw clutch is disengaged. Thus, normally the drive is through the worm-wheels and the change gear, but when it is desired to move the saddle quickly, the magnetic clutch is energised, and the pinion on the motor shaft then drives a spur wheel which is keyed to the screw shaft, I, the latter being thus driven direct. The feed can be varied practically to any extent required between the extreme limits by the combination of change gears and the varying speed of the motor. This gear is worked entirely from the main switchboard by which the man starts and stops and controls the speed of the headstock carrying the gun tube, and the switches are so interlocked electrically that it is

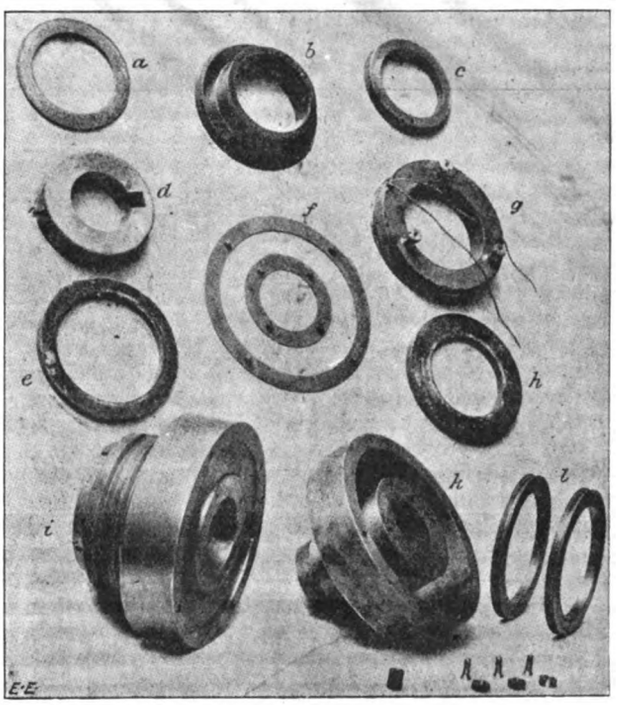

FIG. 4.

impossible either to start the feed gear or to leave it running unless the main motor is running.

It will be seen that there is a magnetic clutch employed in connection with this gear, and as such clutches appear in a good many of the illustrations in the paper, I may as well describe it in more or less detail now. This magnetic clutch is, of course, only a variety of a friction clutch, but it has advantages over the latter in that it can be used under conditions which would be impracticable, and in many instances impossible, for an ordinary friction clutch, owing to the fact that it can be as readily worked from a distance as from close at hand, whilst its action is quicker and more definite as to holding power, and it cannot possibly stick or seize. As will be seen from the accompanying illustration (Fig. 4), the clutch consists of five essential parts: the slip rings, *l*, for conveying the current to the coil, *g*; the circular magnet, *k*; the demagnetising rings, so-called, *f*; and the armature, which is merely a plain disc of Swedish iron or a piece of high-permeability steel. The remaining portions shown in the block are merely insulating rings, screws, and nut for building the parts into the complete clutch which is shown at *i*.

Two of the first clutches made over 15 years ago are shown in Fig. 5, and these are still in perfect condition. I am at present only using two types of these clutches,

Digitized by Google

one rated at 6 h.p. and the other at 25 h.p. at 300 r.p m. Owing to the fact that the voltage of the supply circuit was 300, and also to the difficulty that there is in winding bobbins with a finer gauge of wire than No. 36 S.W.G., or 0·0076in. diameter, it was not practicable to make a smaller clutch than the size named, which is only 7·5in. in diameter; indeed, in this case even it is necessary to add 1,000 ohms resistance to that of the bobbin in order to reduce the current and prevent heating of the coil. Eight thousand turns of wire are employed in either case, the sectional area of the bobbin being one square inch, and the total capacity of the bobbin being 15·7 cubic inches for the

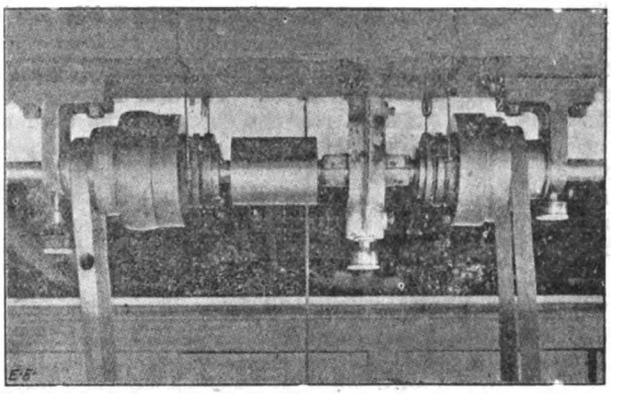

Fig. 5.

6-h p. and 32 cubic inches for the 25-h.p. clutch. Twenty-one watts are absorbed in the magnetising coil of the 6-h.p. clutch and about 42 in the coil of the 25-h.p. clutch. This gives an efficiency of under 1·5 watts per horse-power in the case of the 6-h p., which actually transmits 14·36 h.p. at 300 r.p m.; the 25-h.p. clutch is still more efficient. It will no doubt be readily seen that the diameter of the clutch has a more important effect upon the number of watts per horse-power transmitted than any other factor, and that it is quite feasible to transmit 1 h.p. for quarter of a watt or even less. The original pattern of demagnetising ring was a complete disc, which is simpler and not impracticable; but, obviously, some of the lines of force are uselessly diverted by it, and where high efficiency is desirable it should not be used. In the case of the clutch

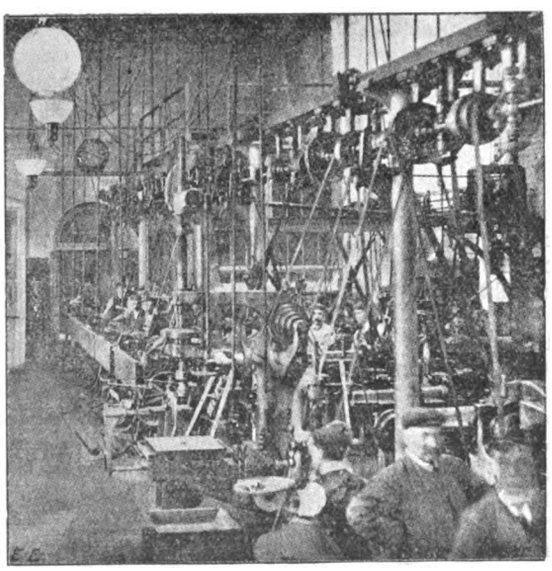

Fig. 6.

rated at 6 h.p. the horse-power transmitted at 300 revolutions is 12·73 with the complete disc as against 14·36 with the two rings—by perforating the disc with a ring of large holes concentric with the bobbin, very nearly the same efficiency is obtainable as with the rings—namely, 14·32 h.p. These figures, as regards horse-power transmitted, were obtained with the surface of the clutches dry and free from oil, and it seems hardly necessary to point out that the horse-power which can be transmitted, if they are well oiled, is considerably reduced; it is, therefore, necessary to arrange in designing the mounting of these clutches that oil shall not by any possibility work itself between the acting surfaces. I have not found any great difficulty in this respect. Where it is impossible or undesirable to prevent the adhering surfaces from becoming oiled, then the clutch must be rated 50 per cent. lower, or else made larger in diameter to transmit the same power as when kept free from oil. Some 117 of these clutches are in daily work at the Gun Factory, and are applied to a variety of purposes, some of which are illustrated in this paper.

A view of the gauge-room, Royal Gun Factory (Fig. 6), shows the method of driving the lathes and other machine tools which was introduced when the shop was remodelled some four or five years ago. I have also some views of existing shops in which the old system of driving is still employed, so that anyone who wishes may be able to appreciate the simplicity of the later system as compared with the former. In the new arrangement the motor—a 15-h.p.—is attached to the wall, and drives the main shaft, which runs down the centre of the shop, by means of a belt at a point about midway in its length at a speed of 450 r.p m. There is none of the usual counter-shafting and its multiplicity of belts; instead there is one cone pulley over each machine, driving the machine in the usual manner with a belt. These cone pulleys are, however, not carried on the main shafts, but on tubular bearings, through which the main shafts passes quite clear, while the bearings themselves are supported on brackets; the pull of the belt thus does not come upon the shaft when

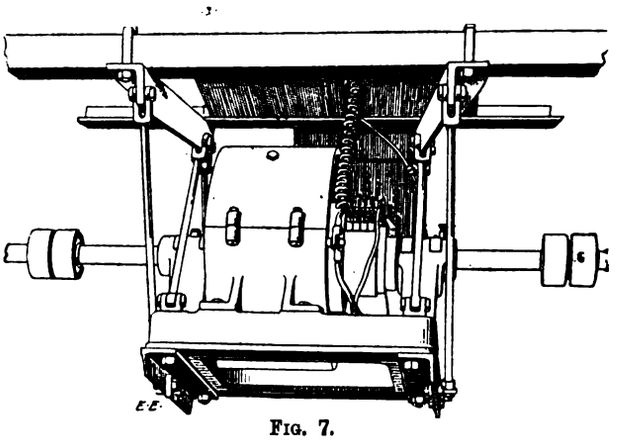

Fig. 7.

the cone pulley is not running and the machine is idle; the cone pulley carries the armature of the clutch at one end of it, and against this end the electromagnet with its collecting rings is keyed or otherwise fixed to the shaft. The pins of the demagnetising rings enter holes in its face, and keep this part of the apparatus in position. Very slight longitudinal play in its bearing is given to the cone pulley, and a slight bias is given to the belt drive, so that the tendency of the pulley is to run from the magnet when the latter is de-energised. It is found that by adopting this simple method no spring or other device is required to keep the surface from contact or rubbing when the clutch is not in action. The extent to which frictional losses are reduced can be imagined when it is explained that when the motor driving belt is thrown off and there is no current on the clutches, the main shaft can be revolved between the fingers. The switches used to actuate the clutches are of a selective type—that is, when the current is off, a pull at the switch rope puts it on, and a second pull cuts the current off again; this appears from practical experience to be more convenient than the ordinary belt-shifting method, in which two ropes are employed, one to put the power on and another one to cut it off. The base of the switch contains a condenser to render the extra current innocuous on breaking the circuit.

North East Shop.—This is the most recent shop built in the Royal Gun Factory, and was designed with a view to electric driving. The work done in this shop is in connection with the smaller kinds of guns and their mechanisms. It is a lofty building measuring 200ft. by 120ft., with the now common saw-tooth roof, and divided into four bays

Digitized by Google

running east and west. There is a gallery running all round it for fitters and benchwork, offices, etc, and the large amount of glass makes it very light. Each bay is served by two eight-ton electric cranes. Altogether on the ground floor there are 83 machine tools, of which 21 are separately motor driven, the other 62 being grouped and driven from one of the four main shafts which serve the same number of bays. The method of driving these main shafts 200ft. long is by means of a 30-h.p. motor (Fig. 7) suspended from the girders and situated in the centre of the shaft, to each half of which it is coupled direct; the speed of the shaft is 250 r p.m.

(To be continued.)

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

EXCESS PRESSURE RISES.

SIR,—In your issue of June 9, 1905, pp. 807 and 808, appears an interesting article as above. This subject is not treated upon in text-books, and is therefore of unusual interest. Could the writer give some data as to the approximate size and length of the water jet required to obtain a given resistance.—Yours, etc, G. MABILLE.

RESIGNATION OF THE WOOLWICH ELECTRICAL ENGINEER.

We gave particulars of this case last week. The matter came before the Woolwich Borough Council on Thursday night, Nov. 16, and was reported in the *Borough of Woolwich Gazette* as follows:

The General Purposes Committee reported receipt of a letter, dated Nov. 8, from Mr. J. B. Mitchell, resigning his appointment under the Council as borough electrical engineer, to take effect on Feb. 16, and they recommended that the resignation be accepted.

Councillor Widger entered his most serious protest against the most discreditable piece of business since the Council came into operation. The resignation, it seemed to him, was tantamount to dismissal. Some members of the committee had a spleen against the engineer, and the complaints had been sent to various councillors and not to the man direct. It was unfortunate that certain members attacked him personally. Mountains had been made out of molehills, and these individuals had been ready to jump down the throat of the engineer on the slightest pretence. The man had to stand all blame and got no credit for anything. He understood the engineer was brought up in the mayor's parlour before three gentlemen and he was practically called upon to resign. Later on he was called upon by two of the gentlemen to resign. He refused, but wire-pulling took place, and a notice of motion came forward asking him to terminate his engagement. He (the speaker) thought there would be some very serious charge, but he found none, and the only explanation was that it would be in the "interests of the borough." That was the only reason he could find. The resolution passed in the Electricity Committee, then he sent in his resignation to the General Purposes Committee. In 1899 the Plumstead Vestry appointed him electrical engineer, and he had made the Plumstead station what it is to-day. He considered the station a model for the whole of London. Later on he had the Woolwich establishment placed on his responsibility, and he had an increase of £100 in his salary, which showed he was giving full satisfaction. The present Council were now going in for "rush without reason." Three temporary servants had had to be retained at the last meeting of the committee. Instead of splitting up the work and calling in an accountant to do the work, or passing it to the proper department, the man was driven on the street—practically ruined, the man and his family. He was bound to say he had not, perhaps, had all the loyalty from his staff which he should have had. His subordinates had been consulted instead of the head, with the consequence that the man was ridiculed. But he believed the majority of the staff were not disloyal, and, in fact, he had heard that some of them almost felt that they would resign. It was the most disgraceful and discreditable action the Council had done.

Alderman Macnamara said that in committee he had given his reasons for moving the resolution which he moved at the committee in respect to the official. He now gave an account of what he alleged to be the condition of affairs in the department.

Councillor Syer said that those who had voted with Alderman Macnamara in the committee were ordered to do so. (A voice: "Nonsense" and "Hear, hear.")

Councillor L. J. Jones said it was true that three of them did interview Mr. Mitchell, but he denied that that official had used the words attributed to him by Councillor Widger. Mr. Mitchell was not asked to resign; they were not driving him in any fashion, and wanted to place the matter before him kindly. They told him the end of the negotiations were in his hands. If he had a proposal, they were prepared to consider it. It was the very last thing in their minds to injure him in any way. The committee waited for an answer from Mr. Mitchell, and then at a meeting he said he had made up his mind to do nothing. The opposition to that recommendation was made simply because they did want to see the electrical department in the borough a success. But if it were a failure now, it should be made a success.

Alderman Harper protested against the recommendation, and said he thought the Labour party should not have taken the case in their own hands, but should have consulted the chiefs of the minority.

The recommendation was carried.

PRIVATE BILLS AND PROVISIONAL ORDERS.

Notices have appeared in the *London Gazette* of intended application for private Bills or provisional orders as follows:

Electricity Supply.—The Northwood Electric Light and Power Co. (Pinner, Stanmore, Harrow Weald, and Edgware), Kent Collieries Limited (Company's Property), City of London Electric Lighting Co. (Power to Supply Railway, Navigation, Canal, and other Companies), Barry U.D.C. (Extension of Time, Transfer), Uxbridge and District Electricity Supply Co. (various places in Middlesex, Buckinghamshire, and Hertford), Metropolitan Electric Supply (Extensions in Middlesex, Herts, Bucks, Berks, and Surrey), Gelligaer and Rhigos R.D.C. (District), National Provincial Electricity Co. (Woodford, Essex), Stepney B.C. (Supply in Bulk, etc.), Electrical Distribution of Yorkshire Limited (Gomersal), National Provincial Electricity Co. (Boston), County of Durham Electrical Power Distribution (Ryton Urban District), ditto (Further Powers), ditto (Crook, Willington, Brandon, etc.) Ascot District Gas Co. (Electrical Powers), Portland U.D.C. (District), Crediton Gas Co. (Electricity Supply), Wantage Engineering Co. (Wantage and District), Additional Electric Power Supply Co. (Huntingdon, Bedford, Herts, Middlesex, and London); Foote and Milne (Sunningdale and District), ditto (Macclesfield), Urban Electric Supply Co. (Godalming Extension), Folkestone Electric Supply Co. (Hythe and Sandgate).

Power Companies.—Shropshire, Worcestershire, and Staffordshire Electric Power Co. (Extension of Area, etc.), Administrative County of London and District Power Co. (Surrey, Essex, Kent, and administrative county of London), South Wales Electrical Power Distribution Co. (rearrangement, etc.).

Tramways and Railways.—Cork City Railways and Works Co. (Cork), London Southern Tramways Co. (Lambeth and Camberwell), Newcastle-on-Tyne Corporation (City of Newcastle) Haslingden Corporation (Haslingden and Walthamstow), Rochdale Corporation (Borough), Mersey Railway (Motorcars), North and South Shields Electric Railway (Extension), London County Council (Blackfriars, etc.), Oxford Corporation (City of Oxford and Counties of Oxford and Berks), South Lancashire Tramways Co. (Extension), Oldham and Saddleworth District Tramways (Abandonment), Empire Electric Light and Power Co. (Romford and District), Nottinghamshire and Derbyshire Tramways Co. (Extension), London Outer Circle Railway (Middlesex and Essex), Bury Corporation (within and without the borough), Baker-street and Waterloo Railway (Various Powers), Metropolitan Railway (ditto), Middlesex C.C. (Edgware-road), Altrincham U.D.C. (Revival of Powers).

Light Railways—Mansfield and District Light Railway Co. (Mansfield, Sutton-in-Ashfield, and Skegby).

General Power Bills.—General Power Bills which include powers relating to electric light and tramways are also being promoted by the Newport Corporation, Corporation of London (Blackfriars and other Bridges), Todmorden Corporation, Huddersfield Corporation, New Mills U.D.C., Hull Corporation, Manchester Corporation.

PERSONAL.

We regret to learn that Mr. G. A. Grindle, M.I.E.E., of the Chloride Electrical Storage Co., was one of the victims of the "Hilda" disaster.

The Nelson Electricity Committee have appointed Mr. M. B. Henry, electrical engineer, Radcliffe, to succeed Mr. W. Alan Fraser as borough electrical and tramways engineer.

At the next meeting of the Llanelly Urban District Council the Estates Committee will recommend that, subject to the sanction of the Local Government Board of the proposed loan of £6,000 for electric lighting, Mr. J. C. Howell be appointed engineer and manager for the next five years at £200 per annum.

DUTIES AND FUNCTIONS OF LOCAL AUTHORITIES.

This title is at the head of two articles by the Right Hon. Lord Avebury in the *Standard* on Monday and Tuesday last. Whatever emanates from the pen of Lord Avebury is worthy of all attention. These articles are followed by others which, drawing our conclusions from the one that has appeared on Battersea, will have no claims for consideration, and are not worthy of credence. The facts relating to Battersea are half truths, the conclusions drawn ridiculous, and the generalisations stupid. We are compelled to give our opinion in this manner, otherwise our general agreement with what Lord Avebury says might be taken to include the articles not due to that gentleman. Lord Avebury sets out once more the salient points that appeal to all those who consider the work of municipalities. Briefly, he tells us the local expenditure in 1868 was £36,000,000, in 1891-2 it was £76,000,000, in 1901-2 it was £144,000,000. Quoting Lord Stalbridge as to the rates paid by railways, in 1891 the amount was £2,246,000, in 1903 it was £4,493,000—an increase of 100 per cent. In 1898 the rates and taxes of the Gaslight and Coke Company worked out at 2·51d. per 1,000ft. of gas, in 1903 they worked out at 3·29d. per 1,000ft. of gas; the totals being respectively £220,000 and £289,000. The outstanding loans of local authorities in England and Wales have risen in ten years £155,000,000, and amounted in 1903 to over £370,000,000. Lord Avebury contends that under the new departure local authorities undertake many functions which used to be left and had better be left to private enterprise. He gives as the principal objections to the new departure:

1. That it will involve an immense increase in the municipal debt.
2. As there will not be the same stimulus to economy and attention, there will be a great probability, not to say certainty, that one of two things will happen—either there will be a loss, or the service will cost more.
3. The legitimate functions and duties of our municipalities are already enough, if not more than enough, to tax all their energies and fill up all their time.
4. In some cases the municipalities will defeat the very object they have in view.
5. It will involve municipalities in labour disputes.
6. It involves the creation of monopolies.
7. It is a serious check to industry, invention, and discovery.

These objections, as we say, are not new. We have at various times discussed them, but it is well to have them tabulated, and rediscussed. We are afraid we cannot, in some cases, accept the inferences to be drawn from the various statements as proof for the old as against the new departure. Each objection is considered, and, while generally in accord, we do not think some of the conclusions of any strength in the controversy. Lord Avebury, as, indeed, do all the supporters of certain companies, assumes that municipalities are almost criminal culprits as regards depreciation, obsolescence, etc, yet when the accounts of these very companies come to be examined it is doubtful if a single one of them, much less any half-dozen, provide to one-half the amount for these things that any single municipality in its ordinary working year does. The reference to Brighton has but a remote bearing on the subject, that to Cardiff contains a principle, though the item relating to reserve is unimportant. Before we can accept the point relative to reserve, we must come to an understanding about definitions. Cardiff, like

Digitized by Google

all other municipalities, pays interest and has to provide a sinking fund, its upkeep is provided out of revenue, and so on, all to be considered when speaking of reserve. The point referring to rating is of great importance. The making of a paper profit by any system of undercharging is wrong, and in every case rating must stand in a prominent position. Assume that the undertaking is conducted in every respect as Lord Avebury would have it conducted except in the matter of rating. Assume, further, that the whole capital involved is found within the four borders of the constituency. The interest upon capital in usual business transactions is really paid by users—that is, by purchase of goods—and the selling price is settled with due regard to this point. In trade we may take it that interest and dividends are synonymous terms; interest is not necessarily fixed. It is fixed or constant as regards municipalities, hence the selling price should include this constant charge. Further, the cost of production must be included in the selling price. Lower or higher rating bears on cost of production, and if it should happen that the rating is lower than it ought to be and the price is fixed for normal conditions, profits are inflated. If buyers are given the benefit of lower cost, they will not have any right to complain. In the case of a municipality, the ordinary ratepayer may have to make up a deficiency of rates caused by the too low rating of the municipal undertaking. On the other hand, the buyer may be mulcted by too high a rating; but under any circumstances the town finances, as town finances, suffer by too low a rating, and the deficiency has to be made up by somebody; if not by users by other ratepayers.

CURRENT PHILOSOPHY.

I was on shift. I often am. The tramway load bobbed up and down like a plump excursionist having a dip at Blackpool. I sat on the handrail of the switchboard and mused. I often do. "Electricity is life," I said. Just then the machine circuit breaker came out with a bang. I took no notice—why should I? The big rotary hummed happily with nothing to do, and I mused on. "All the world's a power scheme, and all the men and women in it merely bits of it—dynamos, motors, transformers, switches, fuses, fittings, feeders, distributors, cars, and what not. Some men are born armatures. They spend their lives whirling in a given set of circumstances—a social field, cutting their lines in unpleasant places, and turning out energy to be sold at a profit—for whom? Some others standing aloof, doing no whirling, are shunts—merely by virtue of juxtaposition inciting others to work—directors, chiefs, managers. I ought to have been a shunt. I used to think I was an ornamental fitting, but that notion was soon knocked out of me. My respected governor held up the mirror to my astonished eyes, set up a revolving field around me, and off I went. I discovered I was only a rotor. He, my governor, spells it with two 't's.' He is an unpleasant man. When dealing with me he says he is a booster. The very thought of him excites all my back E.M.F., but, like an opposition coil in a tripping device, I'm no use till he's switched off. Some men, again, are transformers, and they are useful men. They take all the high-pressure ideas they can hold, and turn out comfortable low-pressure stuff that does what's wanted in the most efficient way. All engineers are transformers. They get ideas at high pressure from the professors at the institutes, run them round a few coils inside themselves somewhere, and hand out (after patenting) arrangements to do all sorts of things—cooking, warming, lighting, tram-driving, wheel-turning. Though it is well that they shouldn't forget that they are no use without the high-pressure notions of the professors. And the professors should remember that without their transformers they are merely dangerous mantraps for unsuspecting non-technical inquirers. Come to think of, it we are, most of us, transformers and spend our days turning our brains into bread-and-butter. Some men are recording voltmeters; they are always measuring the value of their fellows, and they always read low. One man I know acts as a synchronising panel to all his friends. If you get out of step with life, you go along to him and he soon puts you in phase, and you can take your full load. What is a policeman but a copper conductor? And what is ——" Just then the overhead linesman came in. "Wot O," he said, "I have just pulled off a double on the Lincoln and the Grand National." "Then," I said, regarding him sternly, "*you* are a double pull-off." He was just beginning to smile when the chief came up the stairs three at a time, and jambed in the circuit breaker. He whisked round savagely, said the trams had been stopped for half an hour, and wanted to know what the —— (he did really) I was thinking about. I gazed calmly on him for a brief moment and said, "Sir, you are merely a brush discharge. You fill the atmosphere with ozone." "Discharge am I, you young puppy? Then I start off by discharging you." And so he switched me off through a non-inductive resistance (a week's salary). There was no spark, and if anybody wants a tramway charge engineer they will please apply to WORM.

FORTHCOMING EVENTS

FRIDAY, NOV. 24.

North-East Coast Institution of Shipbuilders and Engineers. At 7.30 pm., first annual meeting (in the Lit. and Phil. Society, Newcastle-on-Tyne).

Physical Society.—At 5 p.m., "The Dielectric Strength of Air," by Mr. A. Russell; "On the Electrical Conductivity of Flames containing Salt Vapours for Rapidly Alternating Current," by Dr. H. A. Wilson; "On the Lateral Vibration of Loaded and Unloaded Bars," by Mr. J. Morrow.

Engineering Standards Committee.—At 11 a.m., conference of glow lamp makers at Institution of Civil Engineers.

Institution of Electrical Engineers (Manchester Students' Section).—At 7.30 p.m., address by Mr. J. Swinburne, M.I.E.E.

SATURDAY, NOV. 25.

Institution of Electrical Engineers (Students' Section).—At 10 a.m., visit to tube tunnelling works.

Electrical Trades Union.—At 8 p.m., smoking concert (60, Farringdon-street).

R.E.V. (Electrical Engineering Section).—At 7 p.m., annual regimental dinner, Café Monico.

MONDAY, NOV. 27.

Society of Arts.—At 8 p.m., Cantor Lecture (I.), "The Measurement of High-Frequency Currents and Electric Waves," by Dr. J. A. Fleming.

TUESDAY, NOV. 28.

Institution of Civil Engineers.—At 8 p.m., "Waterways in Great Britain," by Mr. J. A. Saner, M.I.C.E.; "The Steam-Turbine," by the Hon. C. A. Parsons, C.B., LL.D., F.R.S., and Mr. G. G. Stoney, M.I.C.E.

Institution of Electrical Engineers (Manchester Local Section).—"Theoretical Considerations of Feeder Systems," by Dr. W. G. Rhodes, M.I.E.E.; "Street Cable Systems," by Mr. S. J. Watson, M.I.E.E.

WEDNESDAY, NOV. 29.

Institution of Electrical Engineers (Students' Section).—At 7.30 p.m. (at 92, Victoria-street), "Automatic Train Control," by Mr. H. G. Trust.

Society of Arts.—At 8 p.m., "The British Association in South Africa," by Sir W. H. Preece, K.C.B., F.R.S.

FRIDAY, DEC. 1.

Institution of Civil Engineers (Students' Section).—At 8 p.m., "An Installation for the Bacterial Treatment of Sewage at Neath," by Mr. W. L. Jenkins.

North-East Coast Institution of Engineers and Shipbuilders.—Newcastle-on-Tyne, at 7 p.m., annual dinner (Westgate Assembly Rooms).

Rontgen Society.—Dec. 4, lecture by Mr. J. Butler Burke.

Institution of Electrical Engineers.—Dec. 8, annual dinner at Hotel Cecil.

Institution of Electrical Engineers (Manchester Section).—Dec. 8, "Electrification of Existing Steam Railways," by Mr. W. H. M. Parr.

Institution of Sanitary Engineers.—Dec. 13, dinner at Holborn Restaurant.

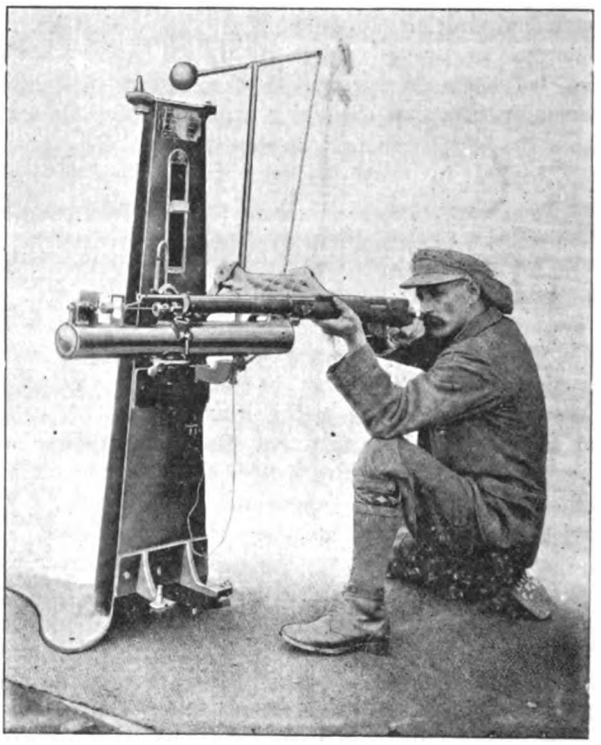
Junior Institution of Engineers.—Dec. 16, visit to works of Messrs. Johnson and Phillips at Charlton.

Digitized by Google

SUB-TARGET RIFLE.

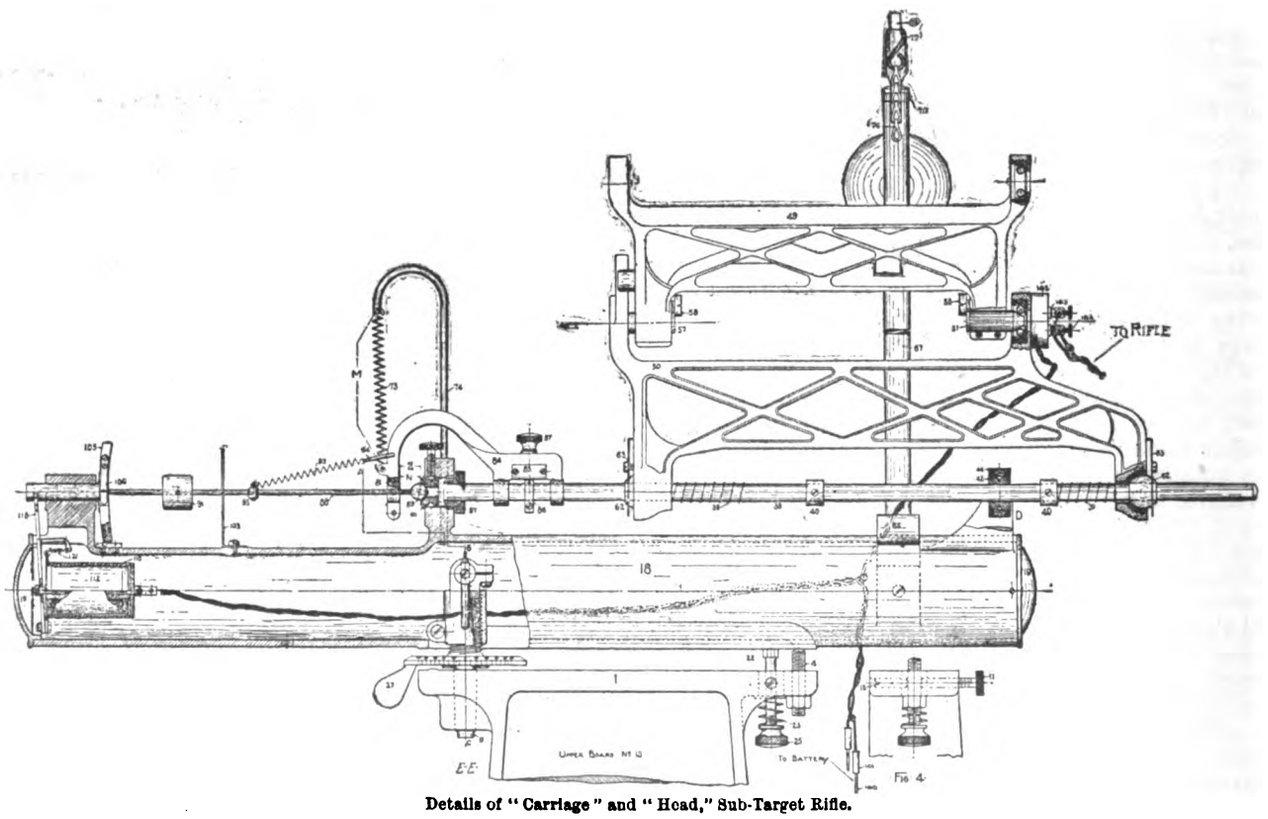
It is appropriate at a time when the nation is being roused to the importance of rifle shooting and the provision of more facilities for instruction that attention should be called to the sub-target rifle, invented by Mr. Henry Havelock Cummings, of Boston, Mass. The principle of this rifle may be explained with the aid of the accompanying illustrations. It will be seen that a strong and heavy upright pillar supports in any position required for shooting—standing, kneeling, or prone—a substantial tube. Above this tube there is placed a delicate rod capable of radial movement in all directions. At the forward extremity of the rod a needle point is fixed, and in a little grooved frame a small card target, about the size of a visiting card, is placed. That is the sub-target. The objective target is an ordinary target, placed preferably 20 yards away, which is ringed to proper dimensions to appear the size of a standard target at any desired distance, say 200 or 500 yards. An ordinary rifle is used for taking aim, being very ingeniously connected to the machine. For this purpose a carriage is provided, to which the rifle is attached. The carriage is mounted on ball bearings, and is connected to a steel radial arm swung on a four-point universal joint on the tube, which is called the "head" of the machine. This arm moves coincidentally with the line of sight along the rifle barrel, and transfers its gyrations, through an ingenious ball differential movement, to the scoring needle.

The weight of the parts attaching the rifle to the instrument is exactly balanced by the weight of the counterpoised ball seen in the illustrations, so that the marksman has only the weight of the rifle to support, and sufficient freedom of movement is given to allow of the rifle being aimed off the target in any direction. The relation of the objective target 20 yards away and the sub-target on the machine itself is determined by calculation of angles, but to allow for variations in eyesight, or constant peculiarities of aiming, the tube ("head") may be adjusted both vertically and horizontally by means of screws. These variations from the normal are recorded on two dials, one corresponding to degrees of elevation on the back sight, and the other to lateral movement for windage. In using the machine the marksman may first sight the rifle with the radial arm locked, so that if any adjustments are necessary to get the sights properly aligned on the bull's eye these adjustments can be made. Satisfied as to that, the radial arm is released, the rifle cocked, and the marksman aims at the objective target and pulls the trigger. On the tiny sub-target every movement of the rifle is indicated by the delicate pointer until at the pulling of the trigger the car darts forward and takes the impress of the needle, exactly corresponding to the aim on the objective target.



A J. Comber, King's Prize Winner, 1905, using Sub-Target Rifle.

The little sub-target is electrically actuated. There is a dry battery in the pillar, and the tube, or "head," contains a powerful magnet, the armature of which impels the target on to the needle when the circuit is closed.



Details of "Carriage" and "Head," Sub-Target Rifle.

This closing of the circuit results from pulling the trigger, a block of metal being placed within the breech of the rifle, to which is fitted mechanism for the purpose. Within this metal block is a cylinder parallel to the chamber, and at the forward end of it is a steel plunger resting upon the upper one of two

Digitized by Google

platinum-tipped phosphor-bronze plates. When the trigger is pulled, the firing pin drives a piston through the cylinder and compresses the air in it in such a way that the steel plunger is caused to bring the two phosphor-bronze plates in contact and close the electric circuit. This process of air compression, in lieu of a more direct action, is adopted to delay the impress of the needle on the sub-target, until a slight interval of time has elapsed, to correspond with the period occupied by the movement of the firing pin, the ignition of the charge, and the travel of the bullet up the barrel. There can be used, if desired, a blank cartridge in the rifle, but as the apparatus is designed for aiming, not for shooting, this serves no purpose beyond that of accustoming the user to the noise of the discharge. Windage allowance can be taught by the instructor purposely deflecting the apparatus from its normal direction, with the aid of a lateral adjustment lever.

Thus there is nothing of the "exhibition-toy" character about this sub-target rifle. On the contrary, it is an invention of great practical utility, at once overcoming the difficulty with regard to sites for ranges, and simplifying the work of instruction to a remarkable degree. There are thousands of would-be marksmen who lack the time necessary to attain proficiency under the old conditions, but the sub-target rifle provides the means for changing all that. It even makes instruction at home a possibility, and for use in schools should prove invaluable In the United States and Canada it has been widely adopted, and is also used in H.M. Navy and Army. But its sale is by no means limited to the services and schools; it has a much wider field, and will, no doubt, do more to effect the end which Lord Roberts has in view than all the talk in the world. Readers interested might do worse than call on the Wilkinson Sword Company, Limited, 27, Pall-mall, London, S.W., where the sub-target rifle may be inspected.

NEWCASTLE LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS.

Inaugural Address by the Chairman,*

W. M. THORNTON, D SC, M ENG, MEMBER

§ 1. The Science and Art of Engineering.
§ 2. The Education of an Engineer.
§ 3. Research, a Good Investment.
§ 4. Research and Practice.

§ 1. In that distant time, a thousand years or so before the nvention—by Hero—of the steam-turbine, the most interesting study for man was man. What problems there were then of science and of art centred upon him as one engaged in a struggle with the great unknown forces of the material world. Our present knowledge of these would seem to those old-time thinkers superhuman, but the fact remains, though it is apt to be forgotten, that the true interest of it all is still in its relation to man. The wisdom and skill which are able to direct these forces of Nature on a large scale form now our wide profession of engineering, well described by Sir Oliver Lodge as "Half science, half art." The science of this is a compound of mechanics, physics, mathematics, and chemistry; the art that skill in the arrangement of materials which enables structural, mechanical, or electrical work to be carried out with the greatest efficiency and economy combined.

In spite of the fascination which problems of science or difficulties of art possess in themselves, they must always be for the few. There is still a wider personal interest in the men who work at them, and more in those who are preparing to take them up as a life work. I propose, therefore, to deal first with a few points bearing on the training of students or pupils for the profession of engineering.

Before the Industrial Revolution and the rise of the conception of free competition as an ideal, the craftsman was both designer and worker. In the process of time the truly creative side of engineering was separated out, and is located now in design-room, drawing office, and study; and since it is the object of the newer school to reduce the responsible thinking of workmen to a minimum, this separation must ever increase. In my works days, for example, engine-fitters as a class looked down upon turners as "machine men"; now, by the increasing use of steam-turbines and milling devices, this is slowly changing, and soon the greatest manipulative art will be that of knowing when to stop.

On the other hand, knowledge of natural phenomena, or science in its broad sense, becomes daily more necessary. Each newly-discovered property of matter is at once pressed into service, and it is the rapidity with which this has been done that gives to electrical engineering the attraction which it has for the lay mind. Those branches of engineering are most interesting which deal with the transport of human life. The deep sense of responsibility felt by every bridge and harbour builder extends to the naval architect, and in a less degree to the marine and locomotive engineer. Electrical engineering compared with these is yet "in its infancy," but when one considers the extreme importance of the electric telegraph and telephone, the transformation of the conditions of urban life by the electric car, or the absence of products of combustion in living-rooms, the results to humanity are already great.

In every branch of engineering there are three distinct classes—proprietors, executive staff, and workmen—each of which requires suitable training. The difference between that of the first two and the last is that a knowledge of the physical laws of Nature is essential for the former, and is to be gained best by a special preparatory education. For the latter a knowledge of a few properties of matter is sufficient to be gained during the practice of the trade. With the training of the artisan I do not propose to deal. His work may be regarded as purely an art, and is handed on through the ages by personal transmission from man to man. There is a transition stage between workman and designer found in the lower orders of draughtsmen. For all practical purposes they may be classed as artisans—they have received the same school training, and their knowledge of first principles is much the same. Every opportunity is now given for talented boys to rise in any class, and the educational systems of Germany and America are good examples of how this may be done well. These countries recognised, one seventy, the other thirty years ago, the value of training those whose industry requires either advanced technical knowledge or power of adaptability. The slower movement of our industries relative to theirs has given rise to much anxious thought and to the Mosely Commission. The result has been to emphasise the importance of having a highly skilled staff to carry out new ideas, the work goes on with so much more ease and certainty. There is no doubt that English manufacturers know their work as well as any in the world, but it is a good thing to have a large body of trained subordinates with ideas of their own and eager to have the chance of seeing them carried out. There are as yet few of this class in England compared with Germany and America, and I believe that this has been one cause of weakness.

§ 2. It may be well to consider shortly the course of training which experience has shown to produce good results. One can assume that a boy desiring to become an engineer of the better sort has been to a good secondary school, and that he leaves at the age of seventeen. He should then have an adequate knowledge of his own language and at least another (French or German by preference), the elements of Euclidian and co-ordinate geometry, algebra to the binomial theorem, trigonometry to solution of triangles, mechanics of a sound, descriptive kind, and a little chemistry and physics. This is not much to ask, for there are to my knowledge schools where this standard is reached without detriment to a general education, by boys who, in view of an industrial career, have been wisely directed. Those who have not been able with ordinary effort to attain to this moderate standard should be given the choice of another career. Classical scholarship can in the future only be afforded or attained by schoolmasters or men of leisure. There is certainly no greater handicap to a boy entering an engineering career than an education on the classical side of any public or secondary school. The pupil should, while his school work is fresh, be required to take the entrance examination at some university where engineering is taught, and this should be regarded as the finishing point of his school life.

One enters now upon debatable ground. Is it better to go straight from school into the works or to college? A boy fresh from school rapidly absorbs the spirit of the place in which he lives. If he is in the shops and left to himself, it is a fact that he soon takes the workman's view, and may learn to regard foremen and managers as, in a sense, his natural enemy. The effect is, however, more far-reaching. It has the tendency to set his future thinking on a lower mental plane. To have large interests and a wide outlook cannot be too early impressed upon a plastic mind, and the workman's view, judging by his talk, lacks both of these. This can, of course, be corrected by wise home influence, but the necessity for direction is not always seen. There are manufacturers who prefer to have a boy straight from school, and it may in many cases be more to their interest, but no desire for cheap labour, or material to mould in any particular direction, should take precedence of the highest national efficiency. I thought once, probably guided by own experience, that it was well to have works before college—one knows what one ought to know so much better—but after many years of close contact with students of both kinds I have come to think that, on the whole, the gain in works' knowledge, and stimulus, is more than counterbalanced by the loss of clear thinking and recognition of first principles which

* Delivered on Monday, Nov. 20, 1905.

Digitized by Google

prove so valuable later. In addition to this, a boy serving an apprenticeship first rarely has a chance of showing ability within three or four years; his lack of knowledge keeps him back, whilst one somewhat older and familiar with the principles and more important constructional details of the work has often an early opportunity to make a name as a keen and reliable fellow, provided that he enters the works with an open mind and is still willing to learn. There is another reason why college should directly follow school. If it is true that the latter is a miniature world, it is still more true of a university, and in this respect our non-residential colleges are closer to the conditions of after life than cloistered Oxford or Cambridge. There is no place where the strenuous life, mental and physical, may be lived more fully than here.

All colleges which provide a three or four years' course in engineering insist on a sound knowledge of the elements of mathematics, physics, and chemistry. The first year is, therefore, almost entirely occupied with learning or revising these, a few descriptive classes or a little geometrical drawing being added for stimulus. If possible, mathematics should be continued through all three years. The power of facile thinking with abstract quantities, though it may rarely have direct expression in after life, is of immense service to engineers. The more advanced laws of heat and elasticity and electricity, and the simpler quantitative and more advanced descriptive treatment of technical subjects will form the second year's course. That of the third year is entirely technical, and of such an order that a student should have little difficulty on its completion in judging for himself the significance of any new suggestion or advance in practice or theory. A fourth year may well be occupied in experimental work on new ideas.

Technical or "bread" subjects, as the Germans call them, have only within this last year been recognised by Government as having educational value, and the rise of the demand for higher technical education is an interesting study. It is a well-known fact in the history of education that "A new standard or fresh subject of education is impossible without the strong impulse of social or professional interest."* About forty years ago there was, as an outcome of the democratic ideas at work in England during the earlier part of the century, a general desire for a national system of education. This was the strong social impulse which resulted in the Education Act of 1870. The necessity for higher education was soon after felt, and the rise of the university college movement began; but from that day to this technical subjects have been regarded either as self-supporting or unworthy of support. I suppose any use of public money for that purpose would have savoured of class legislation, but without the strong backing of professional interests, medical, engineering, or chemical, university colleges would long ago have degenerated into high schools.

Civic patriotism has played a large part in the development of the larger educational ideals. In Liverpool there are twenty-five departments in the University, each endowed with £10,000. Manchester, Birmingham, Leeds, and Sheffield can all show like results. We are rather isolated here in Newcastle, but we shall no doubt in time feel the wave from the centre of activity further south. Perhaps we are stunned by the shock caused by Mr. Carnegie's gift of £2,000,000 to Scotland. Since 1870 the growth of industry upon Tyneside has been phenomenal. Thousands have made fortunes, millions have been employed. The great coal industry, with its connected shipping interests, rests on a substratum of efficient technical knowledge. Shipbuilding and all branches of engineering are to be found here in highest activity, and it is not too much to say that Tyneside owes an appreciable share of its success to the high standard of training maintained by this college throughout the last thirty-four years. Notwithstanding this, we have no permanent endowment for any one of our twenty departments.

§ 3. The most rapid and fruitful return for endowment is in the field of research. It is now generally agreed that the function of a university establishment is both to teach and to extend the boundaries of knowledge. Scientific research falls under two heads. There is, on the one hand, that close study of facts more or less known in order that accurate information may be had for industrial purposes. This is embodied in the National Physical Laboratory, which, being supported by public funds, directs its attention to work of immediate industrial value. On the other hand, there is speculative search into the unknown on lines suggested by unique chains of thought, arising from new observations or strong co-ordinated thinking. Work of this latter kind cannot be undertaken to order. There are times of inventive activity in which ideas come rapidly. Then follows the patient experimental search for truth where so many fall out. Now if it is to come at all, a time of speculative activity almost inevitably follows the completion of a university course, and, it may be, the taking of a degree. It is then that encouragement and, perhaps, pecuniary help are of vital importance to a young student. He should have the opportunity of seeing how to carry out ideas by watching or helping in the research work of his professor, and the advantage is mutual. The enthusiasm of a pupil is the most refreshing thing that can come into the life of a teacher, and the friendship or sympathy of the elder man is always greatly prized by the younger. After all, in the light of the immense unknown, the difference between teacher and taught is very small. It is only the case of one student a little in advance helping another along the same road.

There is in connection with experimental research a disregard by many, though not all, manufacturers of much promising material. We take our young engineers from college and put them for years to routine work which untrained men do as well or better, and are disappointed that they do not show striking results, forgetting that two things are necessary to progress—the man and the opportunity. Medical and engineering students are of much the same calibre, and yet the former are given the opportunity for experiment—under guidance—immediately on graduation. I would suggest that men with a first-class college record should, instead of being treated as beginners, be taken into the confidential departments, design or test room, and set to work on new things, at first under supervision. Of course if there are no new things to work at, the industry is stationary or retrograde. They say no man becomes a good glass-blower until he has broken 10lb. of glass in the process of learning. There should also be some similar allowance made for crude ideas in engineering—say, ten pounds sterling. Fuses cover a multitude of sins in the test-room, and it would take a good deal of work to reach this limit. One result of college training is to produce a large crop of ideas more or less crude out of which finished articles may emerge. In a large industrial centre where there is, as here, close relationship between college and works, I would suggest that where there are not men and instruments available in the works, senior students should be lent occasionally to do a week's work—say, with an oscillograph on wave forms, or on the effects of armature reaction, or in studying interpolar induction or commutation in special cases.

§ 4. The interdependence of science and industry has been a fruitful theme for a hundred years. I do not think it too much to say that all the machines which grow to great size and power begin as little more than toys in the inventor's workshop. The first Parsons turbine, and certainly Faraday's original device for producing electromagnetic rotation, are small enough beside a 10,000-kw. set. One never knows to where an experiment a little off the beaten track will lead. I have recently had a good example of this, on a small scale, which may be of interest to you. Some years ago I made a few experiments upon bacteria, working mostly with typhoid germs on account of their sensitiveness. During these I found that M. Lortet had discovered what I was looking for, that alternating currents cause them to orientate and place themselves along the lines of flow, but he failed to find any effect with direct currents. As a matter of fact bacteria of all kinds, living or dead, orientate in the same way under either direct or alternating electrification.

On thinking over the cause of this, it was found that the movement depended entirely upon the relative conductivity of the organism and the surrounding liquid. So that the former behaves as a rod of iron in a magnetic field, or one of a dielectric in an electrostatic field, the same laws governing lines of stress or steady flow whether of electricity, magnetism, heat, or liquids. In searching for the cause I found that glass orientates in oil, but not in water, and that carbonised silk filaments are very sensitive in either. Some time after I wished to design an apparatus to indicate the state of charge on cables, in order to see whether they were safe to handle. The simple electroscope was first thought of, but rejected as not mechanically strong enough to be placed in a platelayer's hands. It then occurred that one might use the same thing on a small scale, observing the movement in a kind of linen-tester's microscope. On trying this I noticed a small spark pass between two particles of carbon suspended in oil, and the idea at once came, why not look for the sparks? In 10 minutes or so after this the first "voltascope" was made and tried on a 2,000-volt circuit, and a little while later on 20,000 volts. The instrument as it is now made consists of a glass tube containing oil and short fine carbon rods. Contact is made across the mains through a heavily-insulated wire having an ebonite or fibre handle with sharp steel points to get good contact. It works equally well with direct and alternating currents, and in any position. As soon as contact is made the carbon filaments become polarised and form an irregular chain, along which a small current passes, jumping across minute gaps between the particles, and so forming sparks which are instantly extinguished by the oil, their constant appearance and extinction giving the tube the effect of scintillation.

It is a far cry from bacteria to an electric life-saving device, but the same line of thought led further to the invention of the high-tension voltmeter shown. So far as I know, this differs from other forms in the use of a *dielectric* needle or quadrant. A short ellipsoid of paraffin or sealing wax is suspended by a fine silk or quartz thread between brass plates, contained in a glass globe about 15cm. diameter. Theory indicates that the torque on the suspension is proportional to the square of the voltage,

* W. H. Woodward, "Erasmus Concerning Education," p. 85.

Digitized by Google

and this is found to be experimentally true. One uses the instrument in the same way as a Siemens dynamometer or the Ayrton-Mather voltmeter of the same type. The ellipsoid is brought to a balanced position between stops by rotating the torsion head. The lowest voltage to which it is sensitive is about 500, and I have used it to measure spark-gap voltage up to 100,000. Since specific inductive capacity varies with frequency, a simple correction must be applied for this.

There is a still further extension of the same theme. One can measure the permeability of iron by the torque on a long ellipsoid suspended in a magnetic field, and in the same manner one can determine by this instrument the dielectric constants of all solids, liquids, or gases when a litre of the latter can be obtained. The effect is a function of the relative permettivities of ellipsoid and medium, and a comparative series may be readily formed and checked by reference to air. The fact that the results are comparative, and that the zero position of the moving system is the same for all, enables one to work with considerable accuracy. The ellipsoids must be made very carefully. Messrs. Hilger can be relied on to do this.

These examples, given for what they are worth, serve to show that a little research with a microscope may lead to results quite unthought of at the time in an entirely different subject and on a different scale. The microscope might be much more used in electrical engineering than it is at present, if, indeed, it is used at all. We know now that the permeability of iron depends upon the size and distribution of the crystals of carbide of iron in the metal, and that these are changed by the heat treatment this has received. Why should we not estimate permeability by polishing a surface on the metal, observing it through a microscope, and, if necessary, photographing it. After a time, by collecting a set of standards, the quality of any specimen might be assigned in a few minutes by inspection. We have timber merchants selecting wood by inspection of the grain; why not makers of machines selecting magnetic iron and requiring ironmakers, when quoting, to send a micro-photograph of the material?

To carry out research work with any chance of achieving a definite advance, there must be sound preliminary training, and thus we return to the first theme of education for those who will be in a position to do or direct it. There are, we may be sure, hidden in the future, advances in science and practice fully as great as those which we have inherited and which have come to pass in our day. They will come by long and patient search in workshop, laboratory, and study by those men who are, as it were, the growing points of science, thrusting down into fresh, dark, fruitful soil the roots by which the spreading tree of human knowledge is upheld.

MANCHESTER SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS.

Chairman's Address.

BY S. L. PEARCE, M.I.E.E.

Gentlemen,—My first duty on taking the chair this evening is to express to you my sincere thanks for the honour you have done me in electing me the chairman of the Manchester Local Section of the Institution of Electrical Engineers for the present session, and to further express my sense of the responsibility placed upon me during the occupancy of a position that has been filled by the most eminent electrical engineers in this centre, under whom this section has risen year by year until it now holds the first rank amongst the provincial branches of the parent Institution. However inadequate my qualifications for the position may be, I am sure that the hearty co-operation of the committee and all members of the section will be extended to me in my endeavour to emulate the work of my predecessors and successfully discharge the duties of the chair.

It is gratifying to be able to chronicle a steady increase in the membership of the section, which now numbers 84 members, 212 associate members, 149 associates, and 313 students. The success which has attended the formation of the students' section deserves special mention, and the movement will increasingly prove a boon to the younger members of the profession and a source of strength to the section generally. It may not be out of place this evening, at the opening meeting of our session, if I proffer a few remarks to the younger members present before dealing with the main subjects of this address. The power of this country to maintain or to improve its status in the electrical engineering world in the future depends largely on the students of to-day, and the use of present-day opportunities. It is not my intention to discuss this evening what are the essentials of an adequate training for an electrical engineer, or as to whether the period of practical work should precede the college training, or *vice versâ*, or whether both should run concurrently. No doubt many of you have had, or are having the benefit of, sufficient technical training, and have acquired a general knowledge of many subjects allied more particularly to electrical work, but this much needs emphasising to-day, that much of the benefit so derived will be lost unless you see to it that it has a practical application. Mere text-book science will not alone suffice for the student to-day, and when the problems of what has been termed "heavy electrical engineering" are so much to the fore, it is of more and more importance that a practical knowledge of the mechanical side should be acquired. There are many branches in the profession open, but you cannot hope to become a specialist in each. A man who runs a supply undertaking is not usually an expert in dynamo or motor design, nor is he expected to be. By all means acquire a general knowledge of the progress that is being made in the various branches of electrical engineering, and keep abreast of the times, but do not attempt to specialise in each. The meetings of your section, if fully taken advantage of, will certainly prove of great value as a means of exchanging ideas and gaining experience in the preparation and discussion of papers. It has been stated that "the power of putting ideas on paper is that which differentiates an engineer from an able mechanic." Certainly the preparation of an article or a paper will force you to think out a question for yourself, and enable you to come to definite conclusions, thereby gaining confidence. I have no doubt that the session on which you are entering will, in the value of the papers to be contributed, and in the interest thereby aroused, be a thoroughly successful one, and I trust every student will do his utmost to advance the interests of the section.

It is customary for the chairman of an institution such as this to deal in his presidential address with that branch of the work with which he is more intimately connected, or to survey the general progress of electrical science and works throughout the world. The former of these subjects was ably dealt with by my predecessor last year in his comparisons between British and American practice, so that one subject is removed from the list to choose from. The second subject requires a far wider knowledge and a far abler pen than mine to deal with, so I propose to briefly touch on some few of the recent advances made in electrical work generally, and incidentally to indicate some of the problems that yet await solution. The past year has not produced any revolutionary changes in the sphere of electric lighting, but, spurred on by the competition from the gas industry, improvements have been made which tend to the cheaper production of light. The "Nernst" lamp has been more extensively adopted for inside lighting, and in many cases has been able to successfully compete for side street lighting with the incandescent gas mantle. The original form of this lamp, known as the "A" type, with vertical glower, up to quite recently proved the most satisfactory, and it is questionable whether it is likely to be superseded by the latest or "D" type, which employs an enlarged spiral burner, supported in a horizontal position, and giving about 75 c.p. with an energy consumption of about 115 watts. The distribution of light from a horizontal burner is hardly as satisfactory, from a street-lighting point of view, however suitable this type may prove in more confined situations. Want of uniformity is still a failing with Nernst lamps, and this is most apparent in the life of the burners, and is also noticeable in the rate at which the candle-power falls off. Owing to the burners being largely composed of magnesia salts, which have an affinity for moisture, it must not be overlooked that electrolytic action will be set up in damp atmospheres, and will account for the great percentage of burner failures in wet weather. It will no doubt be possible for the manufacturers to overcome this difficulty. The most striking development in the production of a more efficient incandescent lamp is the tantalum, which may be now taken as having successfully emerged from the experimental stage. As its name implies, the metal tantalum has been used in the construction of the filament. A feature of the lamp is the exceptional length of filament required owing to its low resistance, and the ingenuity displayed in evolving a compact and yet suitable form of structure for its support. The lamps are made in voltages from 50 to 120, burning in series or single parallel. A recent series of tests show that the filament of a tantalum lamp increases in resistance with an increase of voltage, and, therefore, increases with the current and temperature. This is an important point of difference between this form of lamp and the ordinary carbon filament. Consequently variations in voltage do not have the same effect in the increase of candle-power emitted—speaking roughly it requires twice the amount of change in voltage applied to the tantalum lamp as the carbon-filament lamp to produce the same change in candle-power. Further, the same increase in voltage for both lamps will give an efficiency gain in the case of the tantalum lamp of about one-half that of the carbon-filament lamp. Fitted with clear globes, an energy consumption of 1·7 watts to 1·84 per mean horizontal candle-power and 2·2 watts to 2·47 per mean spherical candle-power was obtained. The distribution of light in a horizontal direction is remarkably uniform, and is in excess of that given by a carbon-filament lamp, but in an end-on direction is less; the percentage of

Digitized by Google

candle-power emitted end on to that emitted in a horizontal direction in the case of the tantalum lamp being approximately 30. The useful life of these lamps and the reduction in light emitted do not differ materially from the ordinary carbon-filament type, and the power taken during the life of the lamp is practically constant. Tantalum lamps having a 25 per cent. lower efficiency than those just described, with a reduction of some 35 per cent. in light emitted, have been produced to give a useful life of double the number of hours of burning. Of the same order may be mentioned the osmium lamp, with an even lower energy consumption, which, as soon as the initial difficulties in connection with the weakness of the filaments have been overcome, will mark a similar advance in the production of a more efficient incandescent lamp. Interesting results have attended the experiments made by lamp manufacturers in the States to obtain a new carbon filament. Briefly, the chief characteristics may be said to be due to the proper application of excessively high temperatures to the ordinary carbon filament. This high-temperature treatment is, however, but one beneficial step in the whole process of metallising the filaments. It was found that carbon filaments treated with graphite underwent very remarkable changes when subjected to a temperature of 3,000deg. to 4,000deg. C., and subsequent investigations proved that the change was practically all in the treated coating and not in the filament proper. Metallised filaments having a useful life of about 500 hours, with a fall of 20 per cent. in light emitted, are being produced with an energy consumption of about 2·5 watts per candle, as against 3·1, which latter may be taken as the best figure obtainable with an ordinary high-efficiency carbon-filament lamp. In the case of all these new forms of lamps, an increase in first cost is admissible, having in view the higher efficiency and smaller energy consumption.

The mercury vapour lamp has not met with much favour so far in this country, and the progress made in its development is so small that it can hardly be said to have emerged into a practical stage. Attempts have been made to add some red rays, but apparently with little success, and, as sentiment after all still plays an important part in our everyday life, the objectionable colour of the light must to a great extent act as a deterrent to its extensive adoption. A very rapid falling off in the candle-power is noticeable after a comparatively few hours of burning, which may be partly due to the deposit which is formed on the inner surface of the tube. From the point of view of mere efficiency, the various forms of the mercury vapour lamp mark a distinct advancement, their radiation efficiency being five to six times that of the carbon-filament lamp. Until, however, the practical problem of adding the necessary red rays is solved, the lamp is not likely to be brought much into very extensive use.

In the arc lighting world, manufacturers have chiefly given their attention to the improvement of the enclosed "arc" and the development of the "flame" arc. In the case of the former, the absorption of light due to the use of a second or outer globe, and the resultant reduction in efficiency, has been responsible for the production of the type known as the single enclosure. Such a step has meant that the enclosed lamp will possess many of the good points of the open arc whilst retaining the special advantages pertaining to the closed type. The practical convenience of having a lamp capable of burning for at least 120 hours without renewing the carbons is obvious, and must be of great commercial value. A further result of the enclosure of the carbons is found in the lengthening of the arc, whereby the lamp can be made to take a much higher voltage across the arc, and no difficulty is now experienced in running enclosed arcs singly on 200-volt circuits. The improvements that have brought the "flame" arc into its present state have been directed chiefly towards simplifying the feeding devices, and to the manufacture of the electrodes. These lamps have their carbons either arranged parallel or inclined towards each other, instead of vertically above one another as usual, the arcs burning under a reflector, being usually controlled by magnetic influence so as to direct the light to the best possible advantage. The early defects of the feeding mechanism in this class of lamp, so as to keep the arc in a fixed position under the reflector, were responsible chiefly for the unsteady and unsatisfactory light that was produced. The impregnation of carbons with calcium, magnesium, or other salts has received considerable attention of late, and many forms of electrodes of a composite nature have been devised with the object of securing the steadiness of the arc, the lessening of the rate at which they are burnt away, the elimination, as far as possible, of the noxious vapours that are given off, and a lower first cost. One of the main objections to the "flame" arc is the fact that it does not admit of being enclosed, although efforts are being made to partially secure that end by the employment of magazines which shall contain sufficient carbons to obtain 50 hours of burning. The perfect magazine lamp has been coming for a long time; whether present-day manufacturers will meet with any better success than those who have previously attempted is an interesting point. The outlook is distinctly promising. Mention may be made of the interesting lamp known as the "magnetite," which has been brought forward in America; wherein black oxide of iron is used as one of the electrodes, the other, or upper electrode, being of copper of such a section that the heat developed is conducted away as fast as it is generated—the copper never getting very hot, therefore, does not burn away. The light is emitted from the magnetite vapour formed, and the rate at which the lower electrode burns away being $\frac{1}{8}$in. per hour. Various salts are added to the magnetite electrodes for the purpose of increasing their life, and it is said to be possible to obtain a life of 500 hours with an 8in. electrode.

Enough has been said to show that the modern tendency in the development of the electric lamp is to produce luminosity by intensely heating some adjunct which usually takes the form of some rare earth or metallic oxide. To take a parallel, we have the limelight, produced by heating to an intense degree a cylinder of lime, or the Welsbach incandescent, by the heating of a mantle impregnated with metallic salts; so in the electrical world there is the Nernst lamp, in which the burner, composed of metallic oxides, is heated electrically, and the flame arc lamp, with the carbons impregnated with special salts to give added brilliance. The question of the testing and certifying of carbon-filament incandescent lamps has been lately receiving the attention of the Municipal Electrical Association, with a view to securing uniformity of practice amongst lamp manufacturers and a more accurate and reliable grading of lamps. If the recommendation of the report drawn up by the Municipal Electrical Association be in the main adopted by the Engineering Standards Committee, there is little doubt that it will lead to a discontinuance of the use of lamps offered at low prices, which are wasteful in energy consumption and do not give the amount of light specified. It does not appear advisable that municipalities and supply companies should trade in lamps, and the desired end can be attained by enabling all and sundry who trade in lamps to submit them to the local testing authority. Such a plan, if adopted, would have the effect of raising the average efficiency of lamps in use, reduce consumers' accounts, and minimise the unfair and unnecessary advantage which is given to the gas industry by the present use of inefficient incandescent lamps.

In these days of strenuous competition with the gas industry for the lighting of the streets in our large cities or towns, it behoves all interested to take every advantage of the improvements that have been made if this work is to remain in our hands. The application of the intensified or high-pressure system of gas lighting has found favour in many quarters, and is a competition that has to be seriously faced. We had an example of this only recently in London, when tenders were invited for the lighting of the new thoroughfares of Kingsway and Aldwych. With this exception, however, no town of any size appears to be reverting to gas as the result of definite comparative tests between the two rival systems. On the other hand, lighting by electricity is considerably on the increase. Special mention should be made of the present lighting of Fleet-street, London, by gas, but it is clear that this change is made only as an experiment, and cannot be possibly regarded as a case of the supersession of electricity by gas. Against this may be set the fact that the Westminster Council, after conducting extended comparative tests between arc lighting and the high-pressure gas systems, have entered into contracts for a considerable period for street-lighting with the electrical supply companies. That the improved systems of gaslighting are economical as regards amount of gas consumed, maintenance, and labour must be admitted (a figure of 1·08d. per 1,000 candle-power hours being given as the inclusive cost in one instance.) It should be remembered that in the case of incandescent mantles, and more particularly those used on high-pressure lamps, the condition of the mantle will account for great variations in the average candle-power, and this is a point to be taken into consideration when comparing the rival systems on the correct basis—viz., the average total cost per candle-power per annum. Electrical engineers have not much difficulty in showing on this latter basis a superior economy for electric lighting. What the incandescent mantle has done for the gas industry it appears more than probable the flame arc lamp will finally accomplish for the electrical industry. Available figures from recent tests show that the total cost per candle-power per annum of a system of street-lighting using flame arcs is some 30 to 50 per cent. more economical than high-pressure gas, according to whether the arcs are long or short hour. The really burning question is what degree of illumination is necessary and adequate for a given area. So often comparisons are made between the costs of lighting per mile of route, either electrically or by gas, when the relative degree of illumination between the two is out of all proportion. Such comparisons are absolutely useless, very misleading, and give rise to extravagant statements on behalf of the rival illuminants.

One other point touching on this question of street-lighting. On analysing some of the published returns for electrical street-lighting, it will be observed that with a system of open arcs the cost of current may be taken as varying from 50 to 60 per cent. of the total charges, and the cost of the carbons, trimming, and general maintenance the remainder. With a system

Digitized by Google

of "single enclosure" lamps it has been found that the cost of current is some 90 per cent. of the total, the maintenance and other charges amounting only to some 10 per cent. It is pretty evident, therefore, that any system giving long hours of burning has a great commercial value, and it is to be hoped that this may be capable of extension to "flame arcs" by the successful development of the magazine lamp.

(To be continued.)

OLYMPIA MOTOR SHOW.

The fourth international exhibition of the Society of Motor Manufacturers and Traders was opened on Nov. 17, and will remain open until Nov. 25, inclusive. The show was opened with a luncheon, at which Mr. Sidney Straker, A.M.I.C.E, presided over a large and distinguished company, including the Hon. A. Stanley, M.P., Lord Montague of Beaulieu, Lord De La Warr, Lord Russell, Lord Suffield, Sir Ernest Clarke, the Mayor of Hammersmith, Sir Alexander Binnie, the Earl of Wilton, Sir John T. Thornycroft, Sir J. Clifton Robinson, Mr. L. Gomme (clerk to the London County Council), Colonel Holden, R.A., Sir Vincent Hill, Colonel Fox, Sir J. Macdonald, and others.

After the loyal toasts had been honoured, the Hon. ARTHUR STANLEY, M.P., in proposing "The Society's Exhibition," advocated the establishment of a central road authority to deal with the main roads, not necessarily in an executive but in an advisory capacity. He also advocated the employment of the unemployed on the construction of motor roads. He believed this could be done without a penny of new taxation or increased expense. If to the £1,800,000 already contributed by the Government they added the amount received in motorcar and cycle licenses and the amount received in fines, it would amount to something like £2,000,000 per annum, which was the amount, as nearly as he could ascertain, which was spent on the main roads.

The CHAIRMAN, in his reply, said that in connection with the present and the last show the society had spent over £10,000 in order to make the building suitable for their purpose. No second show would be held next year, and, therefore, all sections of motors would be included in one show in November next.

The previous show was held last February, when the decision was taken to hold subsequent exhibitions in the month of November. This decision was based on the fact that more cars are now used in this country than in France, and that London is the chief market of the world. Moreover, it was agreed that for the home manufacturers the month of November was the most suitable time of year. The applications for space immediately following last February's exhibition were such as to enforce the necessity of obtaining increased accommodation, which has been done by the improvement of the annexe to Olympia. The increased space has been chiefly devoted to commercial motor vehicles and marine motors. The space allotted in both these sections has been almost exactly doubled. A further increase of space has been obtained in the gallery, which has been somewhat relieved by the creation of a new section—that for carriage work and components—which is located in the annexe. This is the first occasion on which the importance of the home manufacture of such component parts has been recognised by a special section, showing the great advance in this direction.

There are 264 stands, and the increase in the number of exhibitors is equivalent to about 20 per cent., there being over 300 exhibitors as against 250 last February. The foreign representation is complete. The tyre section is located on the south side of the gallery, and contains several new exhibitors. The machinery section is in the recess on the south side of the annexe. Special attention is called to the marine section, which is very interesting. The motorcars, as before, occupy the whole of the main hall, with the exception of the portion nearest to the annexe, where the commercial section begins. In this section the chief point of interest is the large number of public service vehicles. The building has been greatly improved by the cleaning of the glass roof, as well as by the new roof over the annexe, whilst the electric lighting and the decoration are both on an approved scale. The gangways have been increased, the warming and ventilation reorganised, and there is seating accommodation in the gallery, where Lieutenant Charles Godfrey's band performs daily. The electrical exhibits are again very few, but we saw some beautiful carriages of the Electromobile Company, which are in every respect similar to those described by us on previous occasions, the company having found their type answer so well that they have adhered to it, with the exception of a forced lubricator direct off the motor, which, we are informed, ensures a saving of 2 per cent. We were also told that the contact breaker used has resulted in a saving of £1 per year in maintenance on the cars where the appliance is in use. We also noticed three front-driven carriages exhibited by the Kriéger Electric Carriage Syndicate, Limited.

Magnetic ignition is applied to most of the vehicles in its various well-known forms, and there is a good show of accessories of all kinds.

PHYSICAL SOCIETY.

At the meeting of this society on Nov. 10, Dr. C. Chree, F.R.S., vice-president, in the chair,

A paper on "*The Question of Temperature and Efficiency of Thermal Radiation*" was read by Mr. JAMES SWINBURNE. It has long been known that various surfaces have different emissivities, and it is generally held that at a given temperature some bodies radiate a larger percentage of their total radiation in the form of light. This view is largely based on some experiments by Evans and Bottomley. Evans's experiments really show that if two filaments, A and B, of the same area but of low and high emissivities respectively are run to give the same light, the filament, A, of lower emissivity will give a higher efficiency, and it will give a still higher efficiency if run so as to use the same power as B. This is a natural consequence of the different emissivities, and does not at all show that A gives a higher efficiency at the same temperature as B. Prof. Bottomley's experiments are criticised on the ground that he used no photometer, and his reasoning attacked on the ground that he makes the same slip as Evans in confusing difference of emissivity with difference of efficiency at the same temperature. It is urged that a body, A, at the same temperature as B cannot give out radiation corresponding to a higher temperature of B; for if it could, and A and B were enclosed in a perfectly reflecting space, A would heat B to a higher temperature than A. It may be said that A can have a higher efficiency than B, not by giving out rays corresponding to B at a higher temperature, but by omitting to give some of the longer radiations than B gives. If this were true, a hot body might be surrounded by a thin case of A lined inside with a substance which only emitted and absorbed long waves. The case would then take in long and give out short waves, though colder than the source. High efficiency or selective emissivity are always sought in polished, grey, or white surfaces like flashed filaments, platinum and other metal wires, and rare earths. If there were such a thing, it should be found not in white but in black bodies, as a body which is a specially good radiator of light when hot should be black when cold. Lummer's curves of the distribution of energy for a "black body" and polished platicum are compared, and show somewhat higher efficiency for platinum; but the comparison is difficult. The behaviour of flashed lamps and incandescent gas mantles is explained by the difference of emissivity, without any need for selective emissivities.

The Secretary read a letter from Dr. J. T. BOTTOMLEY, in which he stated that the author's paper seemed to be to a large extent an attack on his work on radiation. He could not see that Mr. Swinburne had made a single experiment in support of his proposition that "in the case of pure temperature radiation, the light efficiency is a function of the surface temperature only." No amount of discussion such as the author asked for could do anything to prove or disprove this proposition. He failed to see that the author had worked out any logical proof of the proposition. The author had assumed that he (Dr. Bottomley) was incapable of matching the light-giving properties of two platinum strips placed side by side and properly arranged for this sort of comparison. The matching is exactly the same in principle as in shadow photometry, and in all the cases cited in the paper to which Mr. Swinburne takes exception, Dr. Bottomley's determinations agreed with those of his assistant, Mr. Evans.

Dr. J. A. HARKER expressed his interest in the paper, and said that the question of radiation was of practical importance in the measurement of high temperatures by electrical resistance methods. He asked if two platinum thermometers, one bright and the other blackened, but identical in other respects, were transferred from an ice-bath into a sulphur-bath, would the final temperatures of the two thermometers be the same, and also would the thermometers approach their final temperatures at the same rate?

Prof. H. L. CALLENDAR, referring to Dr. Harker's questions, stated that if the sulphur bath was in an isothermal enclosure, the two wires would reach the same ultimate temperature although the blackened one would reach it quicker. The difference, however, would be small. With fine wires the loss of heat by conduction through the gas is more important than the radiation loss. The loss by radiation is proportional to the surface, but the loss by conduction is not, and it, therefore, becomes relatively more and more important with the fineness of the wire. With regard to the action of incandescent mantles, he thought the author's theory was reasonable and satisfactory.

Mr. MAURICE SOLOMON said he did not agree with Mr. Swinburne's contention that in the case of solids there was no such thing as selective emissivity, but that all bodies at the same temperature radiated light of the same efficiency. Selective emissivity existed in the case of incandescent vapours, and if it was consistent with the laws of thermodynamics in such a case, it could not be inconsistent in the case of an incandescent solid. With reference to the incandescent mantle, the explanation put forward by the author did not seem satisfactory. It was difficult to believe that the very small differences in colour between a thoria, a thoria-ceria, and a ceria mantle could account for the enormous differences in their candle-powers.

Prof. W. E. AYRTON referred to experiments which he had carried out which tended to show that the temperature of a Bunsen flame was lowered by an incandescent mantle. He had also found that small pieces of mantle heated in a platinum boat to various temperatures just below the melting point of platinum never looked brighter than the platinum. If, however, a small hole was made in the bottom of the boat and coal-gas passed in, the mantle immediately became brilliant.

Digitized by Google

Mr. SWINBURNE, replying to Dr. Bottomley, said that his main argument was that he had not made experiments. In the investigation of a question such as that considered in the paper it was possible to prove much by means of experiment, but it was also possible to attack the problem by thermodynamic reasoning. He expressed his interest in the fact that Prof. Callendar had referred to his views as reasonable.

HAMMERSMITH ELECTRICITY ACCOUNTS.

From the accounts of the Hammersmith electricity department for the year ended March 31, 1905, it appears that the total expenditure on capital account to that date amounts to £210,994. Abstracts of the revenue account, balance-sheet, etc., are appended.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.
To generation of electricity	7,991	9	1
Repairs, etc., of buildings and plant	2,207	18	2
Distribution of electricity	1,329	5	0
Attending and repairs to public lamps	1,467	15	6
Management expenses, salaries, etc.	2,095	4	6
Rents, rates, and taxes	1,432	12	3
Costs of mortgages	51	4	0
Insurance of boilers, engines, etc.	310	5	9
Special charges	2,026	13	4
	18,913	6	7
Gross profit for year	16,856	12	4
	£35,769	18	11

Cr. Income.	£	s.	d.
By sale of current for private lighting	30,329	8	10
Public lighting	4,498	7	10
Meter rents	73	0	4
Miscellaneous receipts—rent of motors, etc.	869	1	11
	£35,769	18	11

BALANCE-SHEET.

Dr. Liabilities.	£	s.	d.
Capital account—amount received	195,890	0	0
Reserve fund account	2,500	0	0
Sundry creditors and deposits	3,007	4	4
Contractors' deposits with tenders	52	11	6
Balance of accumulated net profits	8,452	3	5
	£209,901	19	3

NEW COMMITTEES.

The following committees have been appointed:

DARLINGTON.—*Electricity and Light Railways*—Aldermen Wilkes and Swinburne; Councillors Wooler, Stairmand, Benson, Dixon, Starmer, Crooks, Robinson, Eastwood, and Oliver.

HULL.—*Tramways*—T. B. Atkinson, W. H. Cockerline, W. Hakes, T. G. Hall, E. Hanger, J. H. Hargreaves, D. Livingstone, W. G. Millington, E. Ombler (in the place of Mr. G. Sipling), C. Raine, E. Robson, G. L. Scott, J. Shaw, W. G. Wharram, and W. Wheatley. *Electric Lighting* — F. Askew, T. B. Atkinson, G. J. Bentham, J. Brown, H. Dean (in the place of Mr. G. Sipling), J. W. Gould, E. Hanger, F. O. Hare, D. Livingstone, W. G. Millington, J. Pybus, J. H. Robins, T. S. Taylor, W. Wheatley, and S. P. Wood.

JARROW.—*Electric Light and Tramways*—Aldermen Armstrong and Handyside, and Councillors Archbold Connor, Dillon, Hall, Ramsey, Reavley, and Rose.

LIVERPOOL.—*Electric Power and Lighting*—Councillors R. Dart (chairman), M. Muspratt (deputy chairman), H. McCubbin, F. Smith, W. Boote, T. Burke, H. S. Higginbottom, H. Jones, R. Pritchard, A. L. R. Rathbone, H. R. Rathbone, C. H. Rutherford, T. Shaw, H. Wilson, J. Wilson.

LIVERPOOL.—*Tramways*—Sir Charles Petrie, Sir Thomas Bland Royden, Bart; Councillors F. Smith, J. Duncan, A. T. Salvidge, jun., W. H. Williams, J. S. Harmood Banner, M.P., J. Bibby, R. H. Bullen, W. Denton, J. L. Eills, C. F. Garner, H. S. Higginbottom, S. M. Hutchinson, R. Kelly, T. Kelly, E. L. Lloyd, W. W. Walker.

NELSON.—*Electricity and Tramways*—Alderman W. Reed (chairman), the mayor (Alderman Nelson), Aldermen Haycock and Hartley; Councillors Nelson, Dimsdale, Pattry, Lambert, Smith, A. E. Wilkinson, and E. Wilkinson.

WARRINGTON.—*Electricity and Tramways*—Aldermen Bolton (mayor), Evans, Pierpoint, Smethurst, Tinnion; Councillors Craik, Ellison, Lord, Maginn, Peacock, Pemberton, Wilkinson.

WEYMOUTH.—*Electric Lighting*—The Mayor, Messrs. Whettam (chairman), Lovell, Bagg, Morris, Smith, Honebon, Blakey, Bridle, and Stewart.

APPOINTMENTS VACANT.

Electrical Engineer, Radcliffe Urban District Council. Salary, £150 to £172 per annum.

Wireman for electric light and power plant. Applications to Box 29, *Electrical Engineer* Office.

Representatives for an electrical contracting firm. Applications to Box G 33, *Electrical Engineer* Office.

Laboratory and Workshop Assistant, Battersea Polytechnic, S.W. Commencing salary, 20s. a week.

Assistant Lecturer and Demonstrator in Electrical Engineering, Leeds University. Salary, £175 a year.

Junior Assistant, Peterborough Corporation. Salary, £1 per week. Applications by Nov. 30. See advertisement.

Improver. Wages, 10s. per week. Applications to Box 702, *Electrical Engineer* Office. See advertisement in last issue.

Representative, South Wales district, for the sale of direct and alternating motors. Apply, Box F. Z., *Electrical Engineer* Office.

Electrical Engineer, colliery in the North of England. Applications to Box Q 11, *Electrical Engineer* Office. See advertisement.

Shift Engineer, London station. Salary to commence, £2 per week. Applications to Box 574, Sell's Advertising Offices, London, E.C.

Switchboard Attendant. Wages, 25s. per week. Applications to Box R P 5, *Electrical Engineer* Office. See advertisement in last issue.

Junior Charge Engineer. Salary, 30s. per week, rising to 35s. Applications to the Borough Electrical Engineer, 335, High-street, Cheltenham.

Mechanical Draughtsman, Birmingham University. Salary, £250 per annum. Applications to the Secretary before Nov. 27. See advertisement in last issue.

LEGAL INTELLIGENCE.

ACTION FOR DAMAGES.

Bainbridge v. the Postmaster-General and Crane.

This was an appeal heard before the Master of the Rolls and Lord Justice Mathew on Saturday last from an order made by Mr. Justice Walton at Chambers allowing the plaintiff to add the Postmaster-General as a defendant to an action brought to recover damages for personal injuries alleged to have been caused by the negligence of the defendants or their servants. The alleged negligence consisted in want of care in repairing a footway after the laying of some telegraph wires at Wigan. The action was originally brought solely against Mr. Crane, the Post Office sectional engineer of the district, under whose directions the work had been done. Subsequently the plaintiff took out a summons to add the Postmaster-General as a defendant to the action. The application was to add him personally by name. The district registrar made an order adding the Postmaster-General, not by name, but in his corporate capacity. The Postmaster-General appealed from that order to the judge at Chambers. Mr. Justice Walton refused to strike out the Postmaster-General's name, being of opinion that the question whether the Postmaster-General could be sued was an important question in the action, and was not a matter to be determined on a summons, but he gave leave to appeal.

The Master of the Rolls held that Mr. Justice Walton had been wrong in not stopping the action against the Postmaster-General. In point of fact, he thought the learned judge seemed to have done little more than invite the Court of Appeal to consider the question, but in point of form they must reverse his decision and allow the appeal.

Lord Justice Mathew delivered judgment to the same effect.

COMPANY PETITION.

In the Chancery Division on Tuesday, Mr. Justice Buckley heard the petition of S. T. Biggs and another for the compulsory winding-up of the British Pioneer Electric Light and Power Co. of India. The petitioners asked for an adjournment in order that they might have an opportunity of considering and answering the company's affidavits, which were filed the previous night.

For the company, it was stated that this petition was by a shareholder who was opposed by all the other shareholders, and the difficulty that had arisen was entirely due to the delay of the petitioners. It was of extreme importance to one of the persons concerned that the petition should be disposed of at the earliest opportunity.

The petitioners, however, said they wished to have access to the documents in connection with the sale of a concession for a tramway in Bombay to the British Electric Light Co., and a contract given to a small company, of which two of the directors were the principal shareholders, and the judge ordered the case to stand over for a week.

TRAMCAR AND CART.

Action for Damages.

The Manchester Corporation were the defendants in a case heard at the Manchester Assizes before Mr. Justice Ridley on Monday, when they were sued by a carter named George Meyers for damages for personal injuries alleged to have been caused by the negligence of the defendants' servant. It appeared that a Corporation tramcar and the plaintiff's cart came into collision in Stockport-road at a point near the junction with John-street, where the road is somewhat narrow. The plaintiff on driving out of John-street crossed the tramline to get to his proper side of the road. While he was doing so the car came up and struck a wheel of his cart. The plaintiff was thrown out. On behalf of the defendants the negligence was denied, and the accident was declared to be due to the plaintiff's own conduct. After hearing the evidence, the jury found a verdict for the plaintiff, damages £250, and judgment was entered accordingly.

SALFORD TRAMCAR ACCIDENT.

At the Manchester Assizes on Friday last, before Mr. Justice Ridley and a common jury, Robert Spencer, carriage proprietor, of Bury, sued the Salford Corporation for damages alleged to have been caused to a wagonette in the Bury Old-road on Sept. 2.

The plaintiff was stated to have been driving from Belle Vue to Bury. When he was near Singleton-road, in the Bury Old-road, he had to traverse the looped tramcar lines which at that point occupy nearly the full width of the road. While he was on the loop the last car to Whitefield overtook his wagonette and crushed it into the bank and the hedge. The plaintiff was thrown from the vehicle and sustained injuries.

For the defence, evidence was called to show that when the accident happened the plaintiff was endeavouring to pass the tramcar, and that the collision was due to this cause.

The jury accepted the version of the affair given by the plaintiff, and awarded him £50 damages and costs.

TELEGRAPH POLES.

Judge Russell, at the Farnham County Court on Wednesday, was asked to settle a dispute between the Postmaster-General and the Farnborough Urban District Council as to whether wooden or iron posts should be used for a telegraph wire along Sycamore-road, Church-lane, and Pirbright-road, Farnborough. The Council insisted upon iron poles being erected, and the Postmaster-General objected on the score of expense.

HIS HONOUR said he did not see any really serious difference between creosote poles and iron. The only question seemed to be the obstruction. Both creosote and iron poles were, at the best, unsightly. He thought the application of the Postmaster-General was a reasonable one, and he therefore gave his sanction for the erection.

COMPANIES' MEETINGS AND REPORTS.

EDISON AND SWAN UNITED ELECTRIC LIGHT.

An extraordinary general meeting of this Company was held this week at Winchester House, E.C., for the purpose of confirming the resolution passed on the 30th ult., which was to the effect that, irrespective of any remuneration to which the directors may be entitled under the articles of the association, they shall receive for their services during the year ended June 30, 1905, the additional sum of

Digitized by Google

750 guineas, such amount to be divided among them as they may agree. Mr. H. Wolfenden presided.

The resolution was confirmed.

LANCASTER AND DISTRICT TRAMWAYS.

At the annual meeting of the Lancaster and District Tramways Co. on Saturday last, Councillor A. Bell (chairman) reminded the shareholders that in 1901 Messrs. Kershaw and Co., of Birmingham, contracted with their directors to purchase the undertaking for £45,000, subject to the Corporation extending the period when they would have the right of purchase beyond 21 years. That, however, the Corporation would not grant, and now Messrs. Kershaw and Co. had again approached the Corporation with a fresh proposal, which would lead to the early conversion of the system to electric traction. If the Corporation were not willing to purchase the concern, they ought not to put any impediment in the way of other people purchasing it and doing the work.

BURY, ROCHDALE, AND OLDHAM TRAMWAY.

A meeting of the shareholders of this Company was held in Manchester on Tuesday to receive the liquidators' report. Two years ago the authorities decided to compulsorily purchase the undertaking, and the arbitrator fixed the price at £162,675, which was considerably in excess of the most sanguine expectations. The liquidators have paid off the debentures with interest, and up to the present time have made a total distribution of 31s. per £1 share.

The CHAIRMAN (Mr. J. Coomer), who presided at the meeting, explained that the liquidators had now a balance in hand of £1,620 but they had yet to receive the costs incurred subsequent to February, 1904. There were liabilities amounting to £1,100 incurred by the old company prior to its reconstruction, but the creditors could not be found. The Court was being asked to allow the liquidators to insert advertisements for these creditors, and if they could not be found to say that the £1,100 should pass to the present shareholders. With the additional costs to come in it was estimated that there would be an available balance of £3 300, subject to the retention of the £1,100. It was decided that the two liquidators be allowed £1,000 for their services, which would leave a balance of about £2,300. This was equivalent to an additional shilling per share, and would bring the total distribution to 32s. per £1 share. If the liquidators are not allowed to retain the £1,100 belonging to the old creditors, there will still be a balance sufficient to pay another 6d. per share. Two years before the arbitration proceedings the Company's shares could have been purchased at 4s. each, and just prior to the commencement of the arbitration they were being sold at 10s. each.

RENO ELECTRIC STAIRWAYS.

The accounts of this Company for the period from April 12, 1902, to Dec. 31, 1904, show, after meeting debenture interest, a debit to profit and loss of £2,400.

CAPE ELECTRIC TRAMWAYS.

The report for the year ended June 30 shows a net profit after providing for debenture interest and redemption of £33,550, which, with the balance brought forward, makes £34,342. The reserve fund has been credited with £8 000 and dividends amounting to 5 per cent. have already been paid. The tramways carried in Cape Town 15,020,503 passengers, earning £180 905, against 15 902,998 passengers, earning £195 015 during 1903-1904. In Port Elizabeth 4,227,576 passengers were carried, earning £45,708, against 4,509,786, earning £50,157 for the preceding year. In connection with the shortfall in the gross revenue of £17,558 the directors call attention to the most unsatisfactory conditions which have weighed upon and still depress the entire business situation in Cape Town, Port Elizabeth, and the Cape Colony generally, and as to which at the present no improvement seems in any way apparent. The Camps Bay tramline, leased from the Cape Town Consolidated Tramways and Land Co. has again proved a disappointment, and the year's working, including the rent paid to the Consolidated Co., shows a loss of £13,225, but against this, the report states, must be set the considerable revenue derived by the Cape Town system through the operation of the Camps Bay tramways.

WEST INDIA AND PANAMA TELEGRAPH.

The report of this Company for the half-year ended June 30, 1905, states that the amount to credit of revenue is £32,773, against £34,581 for the corresponding half of 1904. Expenses have been £23,230, against £23,437, leaving a balance of £9,543, to which is added £1,756 interest on investments and £494 brought forward from last account, making a total of £11,793. It is proposed to pay 6s. per share on account of arrears of dividends to June 30, 1905, on the first preference shares, £10,369, carrying forward £1,424. This will leave the following dividends in arrear: on the first preference shares £3,456, and on the second preference shares £14,007. It was pointed out in the last report that at the date of its issue there was a decrease in the traffic receipts. This decrease continued for the remainder of the half-year, and amounted in the aggregate to £993, as compared with the corresponding period of 1904. The traffic receipts for the current half-year also show a decline. The directors have to report that the British Guiana subsidy of £4,500 per annum, voted for 10 years from Jan. 1, 1892, in consideration of the Company's laying a new cable between that colony and Trinidad, and continued at that rate up to March 31 last, has from that date been reduced to £3,000 per annum.

NEW COMPANIES REGISTERED.

African Rubber Co., Limited.—Capital, £70,000. Objects: to acquire and develop the Boniaka rubber concessions on the River Ancobra, near the small town of Baria. Secretary and registered office: A. Parkes, Moorgate Station-chambers, E.C.

Makin and Co., Limited.—Capital, £1,000. Objects: to acquire the business carried on at Sheffield as Makin and Co., and to carry on the business of electricians, electrical, and mechanical engineers, etc. Registered office: 23 and 25, Division-street, Sheffield.

J. S. Fairfax and Co., Limited.—Capital, £12,500. Objects: to adopt an agreement with J. S. Fairfax for the acquisition of certain patents granted to him, and to carry on the business of mechanical, hydraulic, marine, electrical, traction, and general engineers. Registered office: Kew Bridge Engineering Works, 100 and 102 Strand-on-the-Green, Chiswick, W.

Cumberland Power Syndicate, Limited.—Capital, £5,000. Objects: to adopt an agreement with J. Sturgeon, B. H. Thwaite, A. R. Chorley, and J. Paterson, and to carry on in Cumberland and elsewhere the business of an electric power and power gas supply company, and that of electricians, electrical, and general engineers, etc. Registered office: 4, South-parade, Leeds.

Evans's Carburetter and Motor Pump Syndicate, Limited.—Capital, £2,000. Objects: to acquire certain patents for inventions relating to (1) new and improved carburetters and vaporisers for internal-combustion engines; (2) to motor pumps; (3) to a compound nozzle for blowing compressed air, with a suction principle in combination therewith; (4) to a radiator to be attached to internal-combustion engines, for cooling water and for other purposes in connection therewith; to develop, deal with, and turn to account the same, or any improvement thereon; to carry on the business of mechanical and electrical engineers, etc.

Liens Registered.

Northern Counties Electricity Supply Co., Limited.—A memorandum of satisfaction in full of mortgage debentures bearing various dates from March 30, 1904, to Jan. 12, 1905, inclusive, securing £87,000, has been filed.

Llanrwst Electricity Supply Co., Limited.—Four debentures, dated Oct. 30, 1905, securing in all £1,000, charged on the company's undertaking and property, present and future, including uncalled capital, have been registered. Holders: A. P. Elworth, Sandbach; R. Conway, Mostyn street, Llandudno; and O. I. Jones, Plas yndre, Llanrwst.

Northampton Electric Light and Power Co., Limited.—Issue on Nov. 4 of £300 debentures, part of a series created June 3, 1895, to secure not more than two-thirds of the paid-up capital for the time being, charged on the company's undertaking and property, present and future, including uncalled capital. No trustees. Total amount previously issued of same series, £33,200.

Manchester Motor Co., Limited (Birmingham).—Issue on Nov. 2 of £1,738. 1s. 5d. debentures, part of a series created by resolutions of Dec. 19, 1904, and Jan. 12, 1905, to secure £19,000, charged on the company's undertaking and property present and future, including uncalled capital, subject to first mortgage debentures securing £50,000. No trustees. Total amount previously issued of same series, £16,076. 1s. 4d.

CONTRACTS FOR ELECTRICAL SUPPLIES.

St. Pancras.—The Borough Council invite tenders for supplying lead-covered and armoured cables. Tenders by noon on Nov. 30. See advertisement.

London, W.—Messrs. Grice and Co., Addison Wharf, Warwick-road, Kensington, require a 10-ton electric derrick crane with 60ft. to 70ft. jib, continuous current.

Yarmouth.—Tenders are to be invited by the Port and Haven Commission for an electrically driven crane. Including foundations, etc., the cost is estimated at £2,000.

Bermondsey.—Tenders for new plant, estimated to cost £5,390, will shortly be advertised for. An estimate is being prepared for condensing plant, for which tenders will be invited.

Glasgow.—The Corporation invite tenders for (1) electric light installation, etc., and (2) the heating and ventilating for Pollokshields District Library. Tenders by 10 a.m. on Nov. 27.

Glasgow.—The Corporation invite tenders for the supply of 1,000-kw. motor-generators and high and low tension sub-station switchgear. Tenders by Dec. 4. See advertisement.

Ebbw Vale.—The Urban District Council invite tenders for free wiring and supply of incandescent lamps. Tenders by 12 noon on Nov. 25. Full particulars in advertisement columns.

Omnibus Lighting.—A London motor omnibus company is open to receive proposals for the lighting of its vehicles by acetylene or electricity. Apply to Box 306, Willing's, 125, Strand, W.C.

Salford.—The Corporation invite tenders for the wiring of the higher-grade Council school for girls, Victor-street, Salford. Tenders to the Director of Education, Chapel-street, Salford, by Nov. 30.

Sao Luiz.—The Municipality require tenders for electric lighting of the town. Tenders by Dec. 16. Particulars may be obtained from the Municipal Secretary of Sao Luiz in the State of Maranhao, Brazil.

Warrington.—The Tramways Committee invite tenders for the supply and erection of (1) overhead gear; (2) steel rails, fishplates, and fishbolts. Tenders to the Chairman of the Tramways Committee, Town Hall, Warrington, by 12 noon on Nov. 28.

Digitized by Google

Madrid.—The Public Works Department have opened a competition for a scheme for electric tramways from Zumárraga to Azcoitia (Provinz Guipúzcoa). Particulars may be obtained from the Direccion general de Obras públicas. Offers by Jan. 16, 1906.

Launceston (Tasmania).—Tenders are invited for the supply of 500 or more electric meters and for maximum demand indicators. Tenders to Mr. C. W. Rocher, town clerk, Town Hall, Launceston, Tasmania, by 12 noon on Jan. 15. See advertisement in last issue.

Aston Manor (near Birmingham).—The Public Works Committee invite tenders for the maintenance of a portion of their tramway system for 12 months from Jan. 1, 1906. Tenders to the Chairman of the Public Works Committee, Council House, Aston Manor, by noon on Nov. 24.

Whitchurch (near Cardiff).—The Asylums Committee of the Corporation invite tenders for the following plant, to be delivered and erected at the asylum: (Section 1) battery of accumulators, with booster; (2) engines and generators; (3) switchboard. Tenders to Mr. J. L. Wheatley, Town Hall, Cardiff, by Nov. 27.

Castlerea.—The Rural District Council invite tenders for the construction of works for lighting the town of Ballaghaderreen: (1) builders' work; (2) hydraulic turbine plant; (3) electrical work. Specifications and particulars may be had from Mr. C. Mulvany, M.I.C.E., Engineer's Office, Athlone, on payment of £1 as a deposit, returnable after receipt of bona fide tender. Tenders by Dec. 23.

Poplar.—The Guardians invite tenders for the supply and erection of the following plant at the children's homes and schools now in course of erection at Hutton, Essex: (Section X) steam-engines, dynamos, pipework, etc.; (Y, part 1) main switchboard, wiring, motors, etc.; (Y, part 2) fire-alarms, telephones, and electric bells. Tenders to Mr. G. Herbert Lough, clerk, Guardians' Offices, 45, Upper North-street, Poplar, E., by 6 p.m. on Dec. 13.

Christiania.—The Norwegian Telegraph Department are calling for tenders for the supply of 3,000 kg. of bronze wire. Tenders from British firms should be lodged *by their agents* in Christiania by midday on Dec. 1. The conditions of tender can be seen by agents on application to the telegraph authorities at Christiania, Bergen, Stavanger, and Orendal. Apart from the usual Customs duties, a preference of from 10 to 15 per cent. is given to Norwegian manufacturers.

Spain.—The *Gaceta de Madrid* of Oct. 10 contains details of a concession for the construction of an electric tramway as an extension to that of the east of Madrid. Tenders must be sent in by Dec. 13 to the Director of Public Works, Madrid, in whose office particulars may be seen. A deposit of 1,899·95 pesetas, or about £60, is required to qualify any tender. Local representation is necessary. The same journal of Oct. 12 contains a notice of a concession granted to the Sociedad Los Tranvias de Zaragoza for the construction of an electric motor tramway in that city. The *Gacetas* may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

Australian Commonwealth.—Tenders are invited by the Deputy Postmaster-General, Brisbane, for the supply and delivery at the Departmental Stores, Brisbane, of insulators, phosphor-bronze wire, copper sleeves, binders, and tapes. Tender forms, specifications, and conditions may be obtained from, and samples seen at, the Stores Branches, Postmaster-General's Department, Sydney, Melbourne, Adelaide, and Brisbane. Tenders by noon on Dec. 18.—Separate tenders are required by the Deputy Postmaster-General, Melbourne, for the supply and delivery at Melbourne of (1) 10 miles of 26-pair lead-covered paper-insulated telephone cable; (2) 1 mile of 155-pair lead-covered paper-insulated telephone cable (12½lb. conductors); (3) 5,000 barrel insulators delivery within three months of date of acceptance of tender. Tender forms, specifications, etc., and sample of insulator, may be seen at the General Post Offices, Melbourne, Sydney, Brisbane, Adelaide, Perth, and Hobart. Tenders must be endorsed "Tender for ——," as the case may be, and addressed to the Deputy Postmaster-General, Melbourne. They may be deposited in the tender-box at the General Post Office, Melbourne, or, if sent by post, must be prepaid and registered. Tenders by Dec. 17.

RESULTS OF TENDERS.

Stourbridge.—The Guardians have accepted the tender of Cross and Cross, Walsall, for the supply of electric bells, telephones, and tell-tales.

Acton.—The Urban District Council have accepted the tender of the Sloan Electrical Co. for the supply of carbons for the next 12 months.

Sheffield.—Messrs. Vickers, Sons, and Maxim have placed an order for a turbine complete, with condenser, etc., in the hands of Willans and Robinson, Rugby.

Yarmouth.—The Guardians have accepted the tender of Messrs. Cooper and Cunningham, at £19. 19s. 6d., for extension of the telephone system at the workhouse.

Yarmouth.—Two extra cars are to be purchased for the Gorleston and Southtown district, under the original contract with the British Electrical Engineering Co., at £507 per car.

London. — The South Metropolitan Electric Supply Co. (late Blackheath and Greenwich Co.), in view of the extension of their works at Greenwich, have just placed their contracts for the turbine and condensing plant with Willans and Robinson, Rugby.

Worksop.—The Urban District Council have accepted the tender of Chamberlain and Hookham for the supply of electrical slot meters, and that of the Pulsometer Engineering Co., at £200, for water-softening plant.

North-Eastern Railway Co.—It is reported that the above company have placed an order for the early delivery of 200 truck frames of a patent design with the Brush Electrical Engineering Co., of Loughborough.

Poplar.—The Borough Council have accepted the tender of Messrs. Geipel and Lange for provision of plant for the manufacture of disinfectants, at the sum of £325, and an expenditure not exceeding £100 is authorised for the erection and equipment of a shed for the plant.

Battersea.—The offer of Chitty Bros. for the purchase of scrap carbons at the central electric generating station at the rate of 35s. per ton has been accepted. The Lighting Committee recommend the acceptance of the tender of the Electric Construction Co. to provide and fix an electric motor of 15 h.p., together with all accessories, gearing, shafting, etc., at £358. 10s.

London County Council.—The following tenders have been received: (1) for the supply, delivery, and erection of 12 steel coal trucks required for use at the Greenwich electricity generating station:

Kerr, Stuart, and Co., London*	£990	0	0
S. J. Claye, Long Eaton	1,098	0	0
Mountain and Gibson, Bury	1,254	0	0
Hurst, Nelson, and Co., Motherwell	1,290	0	0
T. Davies Limited, Widnes	1,293	12	0
Flavell and Churchill, London	1,317	0	0
Brush Electrical Engineering Co., Loughborough	1,596	0	0

* Recommended for acceptance.

(2) 150 car ploughs, British Westinghouse Electric and Manufacturing Co. (the work to be executed by staff of the tramways department, under the direction of the chief officer of tramways, for a sum not exceeding £1,800).

St. Marylebone.—The Electricity Committee have received the following tenders for the supply of cables:

W. T. Glover and Co.	£7,581
Siemens Bros.	7,516
Callender	7,502
W. T. Henley's Telegraph Works Co.	7 333
British Insulated and Helsby Cables	7,333
St. Helens Cable Co.*	6,405

* Recommended for acceptance.

The same committee also recommend the acceptance of the tender of Elliott Bros., at £2,318. 5s., for the supply and erection of the switchboard at the south end of the generating station; the tender of Chadburn's (Ship) Telegraph Co., at £215, for the supply and fitting of telegraph instruments in connection with the switchboard at the generating station; and the placing of an order with C. A. Parsons and Co., at £1,754, for two spare armatures required for the dynamo at the generating station.

BUSINESS NOTES.

TRACTION.

Geneva Tramways Co.—The traffic receipts for the month of October amounted to £7,993, being an increase of £186 on the same month of the previous year.

Leeds.—The Tramways Committee of the City Council have decided to begin running motor omnibuses from Headingley to Adel along Westwood-lane as early as possible.

Peru.—We understand that various street railway lines are to be changed from horse to electric traction, and a new electric railway is projected to run between Chorillos and Lima.

Cleethorpes.—The District Council have decided to permit the tramway company to extend the electric tramway along the new King's-parade, provided certain conditions are complied with.

Musselburgh.—The Musselburgh and District Electric Light and Traction Co. give notice that they intend to apply to Parliament for powers to construct tramways in Musselburgh and the surrounding districts.

Oxford.—The City Council have decided to apply in the next session of Parliament for an Act authorising them to take over the existing tramways, and to reconstruct and adapt them for the use of electric power.

Manchester.—It is stated that the London and North-Western Railway Co. are considering the project of electrifying their line from the Manchester Exchange Station to Eccles and Patricroft, a distance of about six miles.

Renfrew.—Complaints were made at a recent meeting of the Town Council that workmen's fares on the tramcars were higher in that borough than in Glasgow, and it was decided to lay the matter before the manager of the Glasgow trams.

Buenos Ayres.—The Public Works Committee of the Buenos Ayres City Council have reported favourably on the project of Messrs. R. von Wentzky und Co. for a system of electric tramways to the suburbs of Villa Devoto, Villa Rita, etc.

Radcliffe.—A letter from the Tramways Committee was read at the last meeting of the Radcliffe Council to the effect that the former could not see their way to grant the request of the latter for an improved service of trams on the New-road section.

Weymouth.—With regard to the application of the Great Western Railway Co. for leave to deflect slightly the tramway line on the quay, the borough surveyor has advised that such deflection could be made with safety, and the mayor, on behalf of the Council, has consented to the work being carried out.

Norwich.—At the adjourned meeting of the Town Council a number of complaints were levelled against the Norwich lectr

Digitized by Google

Tramways Co. for their irregular service of cars and other inefficient arrangements, whilst the Council's action in leasing the cars instead of working them themselves was adversely criticised.

Newcastle-on-Tyne.—The tramway employés (motormen and conductors) struck work on Saturday last, but resumed again on Monday morning after a tentative peace had been arranged. Much rioting took place, and the disturbances resulted in the enforced withdrawal of the cars from the streets. Reference to the cause of the strike is made elsewhere.

Tramways Over the Bridges.—A conference was held on Monday to protest against the rejection by the House of Lords of the Bill authorising over-bridge tramways. The members of the conference formed themselves into an association, to be called the North London Over-Bridge Tramways Association, and an influential executive of 20 members was formed.

Twickenham.—Complaints have been made by the District Council against the action of the tramways company in opening roads without giving notice to the Council. The Council feel that, as the highway authority it is entitled to receive notice from anyone opening roads, and have invited a conference of representatives of the districts concerned to consider the matter.

Kensington.—The Harrow-road and Paddington Tramways Co. propose to proceed at once with the work of reconstructing their tramway in Harrow-road for the electrical working of the system, and are prepared to do the work while the Borough Council are excavating and laying creosoted deal blocks on concrete in portion of the Harrow-road. To this the Council agree.

Devonport.—The Tramways Committee have decided to erect tramway passengers' shelters in several parts of the borough. The first shelter will be built at the junction of Albert-road and Exmouth-road. A sub-committee has been appointed to make inquiries with a view to the revision of fares on certain routes, and to consider the proposal for additional stopping places on the company's system.

Liverpool.—Notice has been given that at the next meeting of the Tramways Committee a proposal will be made for the reconstruction of the tramway lines along Everton-road to be proceeded with forthwith, and the Everton Church and Pierhead service established *via* Everton-road, Lowhill, and Erskine-street, returning *via* Brunswick-road and Everton-road (instead of *via* Shaw-street), as soon as possible.

Hyde Park.—The First Commissioner of his Majesty's Works states that, subject to certain conditions, electric carriages will be exempt from the rule prohibiting motor carriages from entering Hyde Park between the hours of 4 p.m. and 7 p.m. during the months of May, June, and July. There is no intention, however, of admitting motor-cars other than electric cars to the park during the prohibited hours.

Siam.—It is reported that an electric tramway has just been installed in Bangkok. This line, which is 12½ miles long, was opened on Oct. 1 by the King of Siam, who fastened the last bolt in the track and turned on the current in the power-house. With the exception of the royal car, for the building of which native or Chinese workmen were employed on the spot, the machinery and cars were manufactured by Messrs. Dick, Kerr, and Co.

Dundee.—The Tramways Committee of the Council were engaged on Monday in the consideration of a report of the manager relative to the opening of the Dundee and Broughty Ferry line, which will take place towards the end of the year. With regard to the covering of cars, the manager was instructed to report fully as to the coverings in use on other systems, while suggestions as to fares and other matters were deferred for consideration at a meeting to be specially convened.

Brazil.—The contract between the State Government and the Companhia Cantareira for a tramway service in the town of Nictheroy and the "barca" service across the bay has been renewed. The company are obliged to substitute electric for animal traction, to extend existing lines, and construct new ones. The works will cost about 5,000 contos—*i.e.*, 5,000,000 milreis, or about £333,000. The company are permitted to buy electric force, and therefore need not make an installation.

Folkestone.—At last week's meeting of the Town Council it was reported that Mr. Sellon was preparing plans and particulars with regard to the construction of an electrical tramway system from the top of Folkestone-hill to New Romney, and he would shortly apply to the Council for an interview. At present Folkestone Corporation are bound by a resolution to construct tramways over certain routes, and they must be on the surface-contact principle. It is supposed that in the course of a few weeks something definite will be heard in the matter.

Essex.—There was a large gathering of North Essex landed proprietors and agriculturists at the town Hall, Great Bardfield, on Monday, in support of a scheme to provide that part of the county with a light railway. It was pointed out that the nearest railway station was 12 miles away, which rendered impossible the establishment of dairies on the farms. Among those who agreed to be nominated directors of the new company and to represent the agricultural interests were Sir Fortescue Flannery, M.P., and Mr. H. T. Laun, who promised to raise £100,000 towards the project.

Hastings.—The company approached the Town Council with a request to be released from the bond of their agreement not to erect an overhead system of trams on the front, and proposed that the Council should consent to a one-clause Bill giving them the power they originally sought. The Tramways Committee, however, recommended the Council to adhere to the position they had all along taken up, and this it was agreed to do, after some discussion. The Hastings Tramway Co. intend applying during the forthcoming session of Parliament for powers to construct and work an overhead system of electric trams in the borough.

Fareham.—The work in connection with the construction of the Gosport and Fareham tramways has been so far completed as to enable a trial to be run over a portion of the line, which took place last Friday. A car was taken from the power station at Hoe Ford, and proceeded over the line to the terminus near Fareham railway station. The car ran at a steady pace on the journey, the several curves and crossing points being taken very easily, and altogether the trial was deemed to be most satisfactory. There remains a little more work to be done near Brockhurst, but the date for the running of the service has not yet been fixed.

Plymouth.—The Tramways Committee on Monday received a petition from the motormen and conductors, who number over 80, for an increase in wages. It was explained that before the introduction of the Sunday service the men worked 63 hours a week, but had the Sunday free. Since the inauguration of the Sunday service they have worked alternate Sundays without increase of pay, but, as compensation, the service being worked on the double-shift system, the hours of labour were reduced to 54 per week. At present the motormen receive a minimum of 21s. a week, rising to 24s., while the conductors earn from 17s. to 19s. a week. The committee decided to increase the wages of the motormen by 1s. a week, raising the minimum to 22s. and the maximum to 25s., and fixed the wages of the conductors at a minimum of 17s., increasing to 20s.

Leith.—The Tramways Committee of the Town Council at a meeting on Thursday last remitted to the Provost's Committee to confer with the Corporation of Edinburgh—if Edinburgh so desired—with reference to the suggested extension of the tramway lines from Seafield to Portobello, from Bonnington to Granton, and from Newhaven to Granton. It was agreed to intimate to Edinburgh that Leith had refused their consent to the National Electric Construction Co. to make a line through Leith to Queen's Ferry. The sections of the Leith electric tramway system between the foot of Leith Walk and Seafield and on Commercial-street, including the swingbridge which spans the harbour at the latter place, were inspected by Colonel von Donop on behalf of the Board of Trade on Wednesday, these being the last to be completed. Immediately afterwards a service of electric cars was put on the routes, and the whole system is now in full working order.

Southend.—At a meeting of the Town Council last week the Light Railway and Electric Light Committee's report on the proposed tram extension was brought forward for adoption. For High-street the committee recommended a service of single-deck cars. The gradient of the Pier-hill would be altered from 1 in 9·77 to about 1 in 11, and other improvements would be made. From the deviation past the Half-way House there would have to be an entirely new road, and it was proposed that the track be laid on sleepers. Colonel Burges had given sufficient land to put down a double instead of a single line. The total extra cost for this would be approximately £3,000. Colonel Burges would also give them land right up to Ness-road. To the Cambridge Hotel the track would be on sleepers, and from there to the High-street, Shoeburyness, the track would be laid on the system now in use. In opposing the report it was said there was a feeling throughout the borough that the time was not ripe for the adoption of the scheme. In the end the whole matter was referred back to the committee for further consideration and fuller reports.

Grimsby.—The tramways company are prepared to construct the Hainton-avenue extension upon the Corporation's conditions with regard to paving, etc., but they refuse to carry out the Welholme-road extension. The Highways Committee have decided that, unless the company were prepared to carry out both extensions on the Corporation conditions, and to complete them within 12 months of the date of the provisional order, the Corporation would oppose any effort made to secure a provisional order for the Hainton-avenue extension only. It was stated at the recent meeting of the Highways Committee of the Council that negotiations were now proceeding between the tramway company and the Great Northern Railway Co. with regard to a proposal by the latter to construct excursion platforms at Weelsby-road. The railway company contemplate carrying excursionists to Weelsby, whence, if satisfactory arrangements can be made with the tramway company, they will be carried to Cleethorpes by electric car. In view of these proposals the committee decided to ask the tramways company to endeavour to obtain an agreement with the railway company permitting the construction of a subway at Weelsby-road at some future date.

Durban.—In his annual report as general manager of the Durban municipal tramways, Mr. H. N. Thomas, late manager of the Huddersfield Corporation tramways, states that although the total income, as compared with the year 1904, is less, this is accounted for by the fact that in the income for 1904 is included a sum of £2,000, transferred from maintenance account to capital account, so that the actual earnings of the department for 1905 are greater. The net surplus appropriated to borough fund shows an increase of £1,247 over the previous year. The percentage of operating expenses to income will compare very favourably with any large and best managed system of any home towns. There is a decrease in the operating expenses per car mile, from 11·77d. to 9·90d. The length of route is 13⅝ miles, length of track 22 miles, maximum grade 1 in 14, sharpest curve 70ft., weight of rail (straight track) 90lb. per yard, weight of rail (curve) 105lb. per yard, number of cars in use 46, average number of cars in daily service 44, seating capacity of cars 54, car mileage 1,097,230, average car mileage per day 3,006, mileage per car per day 68, passengers carried 11 848 191, passengers carried per day 32,460, passengers carried per mile 11·73, total traffic receipts £88 280. 7s. 6d., average receipts per day £241. 17s. 3d., average receipts per car mile 19·328d., average receipts per passenger 1·77d., average receipts per head of population, based on 40,000. £2. 4s. 1d., number of times population carried, based on 40,000, 294.

New South Wales.—We have received a copy of the "Jubilee" number of the *New South Wales Railway Budget*, which was specially got up in celebration of the jubilee of the Government Railway. The number contains short biographical sketches of leading railway and

Digitized by Google

tramway officials in the colony, and is illustrated by a number of beautifully executed photographs. The history of the railways is also related, commencing at the period at which construction assumed a tangible form in Australia. It is interesting to see a faithfully reproduced drawing of the first station buildings erected in 1855 in Parramatta and Sydney, when the neighbourhood was still desolate bush, and to watch the gradual extensions and developments which take place in subsequent years, culminating in the erection of a building which in 1905 adequately represents the commercial activity and prosperity of the capital of one of our most enterprising colonies. A series of meetings were held under the auspices of the Railway Institute during the anniversary services. Photographs are given of the late Mr. E. M. G. Eddy, the erstwhile chief commissioner of railways, and his successor, Sir Chas. Oliver; Mr. W. M. Fehon (commissioner), Mr. H. McLachlan (secretary to the commissioners), Mr. James Fraser (engineer-in-chief), Mr. J. E. S. Corns (goods manager), and other officials. Mr. G. Holt opened discussion on "Tramway Accidents" at a recent meeting of the Sydney Tramway Officers' Association. In a comprehensive and able address he was able to show that, notwithstanding the narrow streets and congested traffic, tramway accidents in Sydney were not numerically more than in England and America, and that the vast majority of these were directly due to passengers boarding and leaving cars while in motion.

Belfast.—At Monday's meeting of the Tramways and Electricity Committee a report was submitted by the general manager of the tramways, in which he stated that the result of the trial of the three engines provided for the special purposes of operating the tramway system brings about a very serious state of affairs. He would require two engines working under full load during a day of 17 hours to work the whole service of 174 cars, together with a third stand-by engine, also capable of working under full load in case one of the others had to be stopped for any reason. The full electric service, therefore, cannot be commenced until Mr. M'Cowen (the electrical engineer) is satisfied that all three engines are capable of working under full load for a lengthy period. The manager further expressed the opinion that the complete service could not be put into operation until Feb. 1. He suggested that in the meantime the southern lines be worked with one engine under three-quarter load, having the second engine as a stand-by, and leaving the third engine in hands of the builders in the hope that they can do whatever necessary to the engines until they are capable of running under full load non-condensing for a lengthened period. It was announced that the Board of Trade inspection would take place on Wednesday, the 29th inst., but that would apply only to part of the system, and the representatives of the Board would have to return at a later date to complete the work. It was also reported that on the Shore-road the telephone wires were actually lying on the wire through which the current for the tramcars would pass, and Mr. M'Cowen considered that it would be impossible to work that route until this state of affairs was remedied. The Lord Mayor expressed the hope that the southern portion of the system would be opened on the 30th inst.
